OHG. *pfanna*, *phanna*, *panna*, Ger. *Pfanne*, AS. *panne*, Eng. *pan*, from ML. *panna*, from Lat. *patina*, shallow bowl). A British coin and money of account. After the sceattæ (q.v.) it is the most ancient of the English coins, and was the only one generally current among the Anglo-Saxons. The penny is first mentioned in the laws of Ina, King of the West Saxons, about the close of the seventh century. It was at that time a silver coin and weighed about 22½ troy grains, being thus about $\frac{1}{24}$ of the Saxon pound weight. This relation to the pound weight is evidently derived from the usage of the early Franks, who retained the Roman division of the libra into 20 solidi, and the solidus into 12 denarii (the denarius being thus the 240th part of the libra or pound). (See MARK.) Halfpence and farthings were not coined in England till the time of Edward I, but the practice previously prevailed of so deeply indenting the penny with a cross mark that the coin could be easily broken into two or four parts as required. Silver farthings ceased to be coined under Edward VI and silver halfpennies under the Commonwealth. By this time the penny had steadily decreased in weight; it was 18 grains under Edward III, 15 and 12 under Edward IV, 8 under Edward VI, and under Elizabeth it was finally fixed at 7½ grains, or $\frac{1}{16}$ of an ounce of silver, a value to which the subsequent copper pennies, inaugurated in the time of James I (c.1609), which till 1860 were the circulating medium, closely approximated. In 1672 an authorized copper coinage was established and halfpence and farthings were struck in copper. The penny was not introduced till 1797, and at the same period the coinage of twopenny pieces was begun; but these latter, being found unsuitable, were withdrawn. The penny of the present bronze coinage is of only about half the value of the old copper penny. The German pfennig was also originally a silver coin, bearing the same relation to the German pound of silver as the English penny to its pound. And in the twelfth century it was made so broad, in imitation of the Byzantine coins, that it would no longer bear to be struck with a die on each side as before, but was struck on one side only. In the beginning of the fourteenth century the mark of silver was anew divided into 60 parts or coins, which, to distinguish them from the old coins, were called "grossi denarii," whence the term "groschen." In the modern monetary system of Germany the pfennig is a nickel coin, the hundredth of the mark, the latter being equal to a shilling, or about 25 cents. Colloquially in the United States a cent is sometimes referred to as a penny. See CENT; NUMISMATICS.

PENN YAN. A village and the county seat of Yates Co., N. Y., 45 miles north by west of Elmira, on Lake Keuka and on the Pennsylvania and the New York Central railroads (Map: New York, C 5). It has an attractive location at the foot of the lake, the shores being covered with cottages and the hills with vineyards. There are Penn Yan Academy, a Carnegie library, and a fine county courthouse and jail. The village is situated in a noted grape-growing and fruit region and has extensive agricultural and wine-making interests, as well as manufactures of flour, grape baskets (extensive), store fixtures, chemicals, and paper. There are also a large buckwheat mill and a cannery. The manufacturing industries are

promoted by excellent water power derived from the lake. The water works and electric-light plant are owned and operated by the village. Penn Yan was settled about 1800 and was incorporated as a village in 1833. The early settlers were partly Pennsylvanians and partly New Englanders (Yankees); hence the name. Pop., 1900, 4650; 1910, 4597; 1915 (State census), 4725.

PENNYCUICK, pĕn't-kūk or kwik, JOHN (1841-1911). An English engineer. After studying at Cheltenham College and at a military school, he became (1858) a lieutenant in the royal military engineers, served in the Abyssinian campaign in 1867, and for 34 years was connected with the public-works department at Madras, India. He had charge of the construction of the great Periyar Diversion, a huge masonry dam across the upper waters of the Periyar in the territory of Travancore. Pennycuick was made a colonel in 1887, became a member of the engineering faculty at the University of Madras, and until 1899 was president of the Royal Indian Engineering College.

PENNYPACKER, GALUSHA (1844-1916). An American soldier, born in Chester Co., Pa. He received an academic education and on April 22, 1861, enlisted for three months in the Federal service as a quartermaster sergeant in the Ninth Pennsylvania Infantry. On August 22 he reentered the service as a captain in the Ninety-seventh Pennsylvania, served throughout the war, and on Feb. 18, 1865, was commissioned a brigadier general of volunteers. Until April, 1864, he was engaged principally in the operations along the Atlantic coast. He was then transferred to the Army of the James and participated in the action at Drury's Bluff (May 13-16, 1864), where he was wounded, and later led a brigade at the capture of Fort Harrison, where he was again wounded. He recovered in time to participate in the final assault on Fort Fisher (Jan. 15, 1865), but was again wounded, this time so severely that he was confined to the hospital until April, 1866, when he resigned from the service. During this time he received his commission as brigadier general of volunteers and the congressional medal for bravery in battle. The following July he was appointed colonel of the Thirty-fourth regular infantry, and on March 2, 1867, was brevetted major general of the United States army. In 1869 he was transferred to the Sixteenth Infantry, which he commanded until his retirement in 1883. He was made brigadier general of the United States army, retired, in 1904.

PENNYPACKER, SAMUEL WHITAKER (1843-1916). An American politician, born at Phoenixville, Pa. He served as a private in the Twenty-sixth Emergency Regiment at Gettysburg in 1863, in 1866 graduated LL.B. from the University of Pennsylvania, and a year later was president of the Law Academy of Philadelphia. After serving three years as a member of the Board of Public Education of Philadelphia, he was judge of the Court of Common Pleas in 1889-96, presiding judge until 1902, and Republican Governor of Pennsylvania in 1903-07. As Governor his personal character was unassailed, but it was generally considered that he served as a figurehead, while "Boss" Quay (q.v.) ran the government. In 1912 he was a member of the Pennsylvania State Railroad Commission, and then was appointed to the Public Service Commission of the State. Penny-

packer acquired a notable library of early Pennsylvania imprints and became president of the Historical Society of Pennsylvania. His publications include: *Historical and Biographical Sketches* (1883); *Anthony Wayne* (1908); *Pennsylvania in American History* (1910); *The Desecration and Profanation of the Pennsylvania Capitol* (1911); *Pennsylvania, the Keystone: A Short History* (1914).

PENNYROYAL (variant, influenced by popular etymology with *penny*, of obsolete *puliolroyal*, ME. *puliall real*, from ML. *pullium regale*, Lat. *puleium regale*, royal fleabane, from *puleium*, fleabane, from *pulex*, flea, and *regale*, royal, from *rex*, king). In England, *Mentha pulegium*, a species of mint (q.v.). In North America a small plant (*Hedcoma pulegioides*) also bears this name, and having, like the mints, a pleasant aromatic smell and a warm pungent taste, it is used as an infusion in domestic medicine to promote perspiration. The plant is common from New England to the Dakotas and southward. The name is also sometimes applied to *Mentha arvensis canadensis*, which resembles the English pennyroyal (*Mentha pulegium*). The medicinal properties of pennyroyal depend on a volatile oil, a bitter principle, and tannin. It is used largely as a stimulant and in flatulency.

PENOBSCOT. A former leading tribe of the Abnaki confederacy (of the Algonquian stock). They claimed the entire basin of the Penobscot River, Maine, and had their principal village, of the same name, about the present Veazie or Bangor. A French mission was established there in 1688. When first known to the whites the Penobscot, under their chief, Bashaba, seem to have had dominion over all the New England tribes southward to or beyond the Merrimac River. They took active part on the French side in all the Colonial wars on the New England frontier up to 1749, when they made a treaty of peace with the English and have remained quiet ever since. This treaty brought them into disfavor with the Abnaki and other refugees at St. Francis, who continued hostilities in the French interest, for which reason very few of the Penobscot ever joined their emigrant brethren in Canada, but remained in their old homes. For their services on the American side in the Revolution they were confirmed in possession of a small reservation on the Penobscot above Bangor, where they still reside, their principal settlement being Old Town, on an island in the river. They now number 266, still preserving their language and subsisting by hunting, fishing, lumbering, and basket making.

PENOBSCOT BAY. The largest and most important inlet of the Atlantic Ocean indenting the coast of Maine (Map: Maine, D 4). It is about 20 miles wide from Owl's Head to Isle au Haut, and about 28 miles long from this entrance to the mouth of the Penobscot River. The entire indentation is divided into East and West Penobscot bays by a line of large and small islands, the largest of these being North Haven and Vinal Haven.

PENOBSCOT RIVER. The principal river of Maine. It rises on the northwestern boundary of the State and flows east to Lake Chesuncook, then southeast through Pamedumcook Lake at the foot of Mount Katahdin, and finally southward until it empties into the Atlantic Ocean through Penobscot Bay (Map: Maine,

D 4). The total drainage basin comprises 8500 square miles, and about two-thirds of it consists of timberland. The principal tributaries are the Mattawamkeag, which enters the main stream from the east, and the Piscataquis, from the west. Considerable water power is developed from the river, especially for the paper and pulp mills at Old Town, West Enfield, and Millinocket. The river is navigable for about 24 miles to Bangor, which is at the head of tidewater. Consult Barrows and Babb, *Water Resources of the Penobscot River* (Washington, 1912).

PENOL'OGY (from Lat. *pœna*, punishment + Gk. *λογία*, -logia, account, from *λέγειν*, *legein*, to say). A term defined by Dr. F. H. Wines, one of the foremost penologists of the United States, as the treatment of crime for its repression and prevention and of criminals for their extirpation or rehabilitation. The oldest form of the forcible repression of crime and treatment of criminals is execution. The death penalty naturally suggested itself to primitive peoples as the simplest, surest means of ridding society of its dangerous members. With the advance of civilization, however, the number of offenses for which the death penalty is inflicted, has steadily decreased. (See CAPITAL PUNISHMENT.) A later important form of forcible repression is that of transportation, or the establishment of penal colonies, to which criminals are removed. England, Russia, and France have employed this system with more than doubtful success. England, indeed, has abandoned it. (See TRANSPORTATION, PENAL.) A third and later form is the prison. The idea of punishment by imprisonment does not seem to have entered the mind of the rulers of antiquity, although the prison was as a matter of fact, from its crowded and filthy condition, its want of ventilation, the foul fevers and plagues engendered there, and the starvation inflicted upon its hapless inmates, a place of torture and speedy death. It was primarily a place for the sequestration of persons obnoxious to the despotic ruler, as well as of debtors, and for the detention of persons charged with other crimes until they were tried. It is only in comparatively recent times that the prison itself has come to be regarded as a place of punishment, a place for the confinement of condemned persons; and the name "jail" is now generally employed to designate the place where persons under accusation are compelled to abide pending the determination of their guilt or innocence. Of all the institutions of this kind in the United States, the county jails are the most unsatisfactory; they are generally breeding places of crime and licentiousness, because prisoners of all grades, of all ages, and sometimes even of both sexes, are herded together.

The idea of reformation has for a century played an increasingly important part in modern prison systems. In 1773 John Howard, an English country gentleman, having been appointed high sheriff of Bedford, found so many abuses in the jails of his county that he was moved to call the attention of all England to its prisons everywhere. Up to this time the management of jails in England was under no public supervision whatever. It was the custom of the jailer, who was not even paid by the community for the performance of his duties, to collect his fees from the prisoners in his custody. Howard's life was henceforward spent

in attempts to improve the conditions of the prisoner, but his reforms were mainly those which looked to the humane treatment rather than to the reformation of the criminal.

The problem of the restoration of the criminal to society is a later work of the penologist. As to the method of its solution penologists do not all agree. Two distinct systems of prison discipline, which are commonly known as the Pennsylvania, or Philadelphia, and Auburn systems, have grown up in the United States. The first, or separate, system insists upon the separation of prisoners by day and by night; the second, by night only. From these two a third has been evolved, which is in a certain sense a combination of the two but has also distinct features of its own. It is known as the Irish system, because it has been most fully and successfully applied in Ireland, under Sir Walter Crofton.

The essential principle of the separate system is the complete physical separation of prisoners. It rests upon the conviction that mutual contact among them is necessarily corrupting and that classification upon any basis except that of individual character is impossible. At first solitary confinement, without labor or recreation or mental contact with any human being, even with the officers of the prison, except in case of necessity, was the form which this experiment assumed. But the severity of this rule has been relaxed on account of the injury which it wrought in some cases both to the body and the mind of the subject. Now the prisoner is not excluded from a degree of companionship with the prison officials and authorized visitors. The convict, however, sleeps, eats, and works in his cell alone, and takes his exercise in an adjoining space outside. It is claimed for this system that it removes a man from evil associates, trains him as an individual, and increases the personal influence of the authorities and teachers; that it gives greater opportunity for reflection; that the convict who reforms under it cannot afterward be identified by professional criminals and so led back to evil ways; and that discipline may be varied according to the needs of individual convicts. The objections to this system are: that it necessitates a large ground area and costly buildings; that it unfits a man for ordinary methods of work, because he has worked alone and under exceptional conditions such as do not prevail in the outside world where men coöperate; that loneliness is injurious to morals and to mental and physical health. It is claimed, however, that this system has produced excellent results; its friends maintain that, more than any other system, it reduces the number of recidivists, i.e., of discharged convicts who lapse again into crime. The International Prison Congress of 1900 reached the conclusion that this method must be regarded with favor as having checked criminality.

The prison at Auburn, in the State of New York, represents the congregate or silent system, which now prevails throughout the United States. Prisoners sleep in separate cells, but are brought together during the day in large workshops; separation among them, the necessity for which was acknowledged, is secured by a rule forbidding them to communicate with one another or with visitors. The difficulty of enforcing this rule has led to its relaxation. The Eastern Penitentiary in Philadelphia was

intended to be a strictly cellular prison for convicts of the higher grades, but it has long since ceased to be such, because of its seriously overcrowded condition. Among the causes which have contributed to the general adoption of the Auburn system are: the comparative cheapness of construction and maintenance of congregated prisons; the ease with which profitable labor may be introduced into them, especially in connection with machinery of all sorts; the facilities which they afford for contracting out the labor of convicts, thus relieving the administration of financial responsibility.

The Irish system was, in its origin, an outgrowth of the experience of Captain Maconochie as governor of the penal settlement of Norfolk Island. Maconochie devised the mark system, which is added to the ticket-of-leave system, or conditional liberation (also an Australian invention), and the progressive classification and the intermediate prison, to constitute the four elements of the Crofton system. Briefly described, this system consists of four stages, of which the first is not less than eight months of strictly cellular confinement in the Mountjoy Prison, Dublin, with short rations and no employment but picking oakum for the first half of the time. The second is an indefinite period, not less than one year, of associated imprisonment, at Spike Island, where the prisoners are divided into four classes and are promoted from one to another according to their demeanor, labor, and study, an account being kept with them by the use of marks, and their promotion depending upon their record. The third is a short period of probationary detention in a condition intermediate between imprisonment and freedom, at Lusk, where the men are trained for entire freedom, and their capacity for it is tested prior to their liberation. The fourth is conditional liberation with police supervision. This system is supplemented by a scheme for obtaining employment for liberated prisoners.

The first American institution managed along these lines is the Elmira Reformatory (q.v.), opened in 1876 in the State of New York and known as the New York State Reformatory. Prisoners received here are such as are convicted of their first offense for felony, and are held under what is known as the indefinite or indeterminate sentence; i.e., they are not sentenced for a specific period of time, but may be held for the maximum period for which they might have been sentenced for the crime committed, and cannot be discharged until they have served the minimum period provided by statute for such offense. Having served such minimum period, they may be allowed by the board of managers to leave the prison on parole, but must remain while on parole under the control of the board and subject to be taken back to the institution.

Concerning the indeterminate sentence it should be noted that eminent penologists have favored this device on the ground that it is impossible for courts of justice to know just how long a period of incarceration is necessary to produce the desired effect upon an offender. Of two criminals sentenced to 10 years' imprisonment, one may be at the expiration of this period entirely unfit to be released, while the other may have become ready and willing to assume the duties and responsibilities of citizenship. The fixed sentence, it is asserted, is as absurd as it would be for a physician to prescribe medicine for a period of 10 days and then omit to inquire

what effect this treatment has produced in the patient at the expiration thereof. With an indeterminate sentence the prisoner is virtually his own custodian. When he understands this his reformation—assuming him to be a reformable person and not a criminal by instinct—is rendered far more probable. The hope of freedom is the one stimulus to which he may be depended upon to respond. When the criminal is convinced that this hope is to be realized, not through some vague chance of pardon or escape, but whenever by his conduct in prison he makes it apparent to those in charge that society has nothing to fear from him, the work of his reformers is comparatively easy. Most penologists, therefore, see in this almost certain means of securing the cooperation of the criminal, a principle of reform of the greatest importance.

By means of the indeterminate sentence a prisoner may be liberated conditionally, on parole. It is this actual experience with the outside world which establishes a man's powers and intentions. Within the prison walls he cannot steal, or murder, or forge signatures, or otherwise menace the life or property of his fellow man.

The indeterminate sentence has been tried in more than a quarter of the American commonwealths since 1876, but it has met with much opposition from the courts, judges very generally regarding it as an infringement of their prerogative of sentence and finding constitutional objections to it unless the statute creating it is drawn with extreme care to fix a definite period for the expiration of sentence, and in some cases unless the release on parole is specifically described as a commutation for good behavior.

In some of the Western States convicts have been placed at work without guards, on their word of honor that they will not avail themselves of the opportunities to escape. Colorado introduced this honor system as early as 1908. The convicts were placed in camps and put at work building roads; the armed guards were dispensed with. Much more work was performed than formerly under the constant supervision of the prison officials. In four years about 1800 men were put on their honor; though sometimes the camps were 300 miles from the prison, the violations of the pledge amounted to but 1 in 100. In Oregon, on the initiative of Governor West, the honor system has been introduced. Of 450 prisoners under sentence, more than 200 are allowed to go out to work daily, are trusted to do a fair day's work and to return at night. The honor system is applied also to 100 men who are on parole or who have been conditionally pardoned. These men are bound to report once a month or oftener to the authorities. Of those who still remain in the penitentiary, many are given positions of trust and responsibility and are allowed privileges of attending Saturday baseball games, moving pictures, night school, and religious services. Punishments for breaches of faith are loss of privileges, wearing of striped uniforms, etc. The proportion of escapes is approximately the same as when the men were closely guarded. See CRIMINOLOGY; JUVENILE OFFENDERS; PRISONS; PUNISHMENT; RECIDIVISTS; REFORMATORIES.

PENRITH. A market town and urban district of Cumberland, England, in a picturesque and fertile valley, with rich and striking scenery in the vicinity, 18 miles southeast of Carlisle (Map: England, D 2). It has ruins of a fine old castle and in the parish churchyard is a monument of great antiquity known as the Giant's Grave, formed of two pyramidal stones about 12 feet high. The town owns an ancient free grammar school. It is in an agricultural district where sheep and cattle are raised. There are tanneries, saw mills, and breweries; the trade is chiefly agricultural. Pop., 1901, 9180; 1911, 8973.

PENROSE, BOIES (1860-). An American politician, born in Philadelphia. He was educated by private tutors, at the Episcopal Academy, and at Harvard, where he was graduated with honors in 1881. He then studied law in the offices of Wayne MacVeagh (q.v.) and G. T. Bispham, was admitted to the Pennsylvania bar in 1883, and became a member of the Philadelphia firm of Page, Allinson, and Penrose. With the advantage of wealth and old family, he entered Republican politics early, being elected in 1884 to the Lower House of the State Legislature. There he forced recognition from the party leaders by his efforts to secure the passage of the Bullitt Bill reforming the charter of Philadelphia; but, having succeeded, his activity as a reformer apparently ceased. In 1886 he was elected to the State Senate and in 1890 and 1894 was reelected, being chosen President pro tem of that body in 1889 and 1891. In 1897 he was elected to the United States Senate. By this time he had become a controlling factor in State politics and was regarded as the lieutenant and prospective successor of Matthew S. Quay as leader. Reelected Senator in 1903, 1909, and 1914, he served as a member of many important committees and was chairman of those on Post Office and Post Roads, Immigration, and Finance. He was influential in the enactment of the Chinese Exclusion Law. Although rarely speaking on the floor, Penrose was an indefatigable committee worker, and his influence and power in the Senate gradually increased. A regular, identified with the standard element of his party, and a conservative of conservatives, he became the leader of his party in the Senate on the retirement of Senator Aldrich, and soon afterward powerfully aided President Taft in the fight for a reciprocity treaty with Canada. In 1912 a bitter controversy occurred concerning campaign contributions, and his name was prominently and unfavorably associated with the Standard Oil Trust. In the national campaign of that year he was frequently mentioned in the denunciations of

boss rule and machine politics and was sharply criticized as being a boss of the worst type. Such censure, however, had no effect upon his position in Pennsylvania, for in 1914 he was reelected to the Senate over Palmer and Pinchot by an overwhelming plurality. He contributed articles on municipal law and government to the *American and English Encyclopedia of Law*, and with his law partner, Allinson, published a *History of the City Government of Philadelphia* (1887).

PENROSE, FRANCIS CRANMER (1817-1903). An English architect, born at Bracebridge, near Lincoln. He studied under the architect Edward Blore and was graduated at Magdalene College, Cambridge, for which he was traveling bachelor from 1842 until 1845. His *Principles of Athenian Architecture* (1851), a valuable work, was published by the Society of Dilettanti. In 1852 he became surveyor of the fabric of St. Paul's Cathedral, which position he occupied until 1897. He received the royal gold medal of the Institute of British Architects in 1883, and was president of that body in 1894 and 1895. In 1886 he was made director of the British Archaeological School at Athens. Other works by him include *Graphical Method of Predicting Occultations of Stars and Solar Eclipses* (1869) and "Orientation of Greek Temples," in the *Transactions of the Royal Society* (1893-97).

PENRY, JOHN (1559-93). A Puritan writer. He was born in Wales and was graduated B.A. at Cambridge, 1584; M.A., Oxford, 1586. Although always a layman, he was deeply interested in controversial theology on the Puritan side. It is, however, as the moving spirit of the little company of writers and printers who brought out the Martin Marprelate tracts (see MARTIN MARPRELATE CONTROVERSY) that Penry is remembered. The excitement that was caused by these bitter attacks on the alleged evils of the Church of England made it necessary for Penry to seek refuge in Scotland (1590-92). He was well received by the Presbyterian ministers and preached there. In September, 1592, he ventured to return to England and settled in London. The following year he was arrested, brought to trial, and was found guilty of treason. He was hanged on May 29, 1593. Consult his *Life* by Waddington (London, 1854).

PENRYN, pen-rin'. A municipal borough and market town in Cornwall, England, in a richly productive valley bordering on Falmouth harbor, 2 miles northwest of Falmouth (Map: England, A 6). The famous Penryn granite is obtained here; 20,000 tons have been exported in a year. It also manufactures chemicals, fertilizer machinery, lumber, leather, paper, and gunpowder. The rental of corporate property covers all principal expenses, and the town levies no local rates. Its incorporation dates from 1216. Pop., 1901, 3190; 1911, 3092.

PEN'SACOLA. The third city of Florida, a port of entry, and the county seat of Escambia County, 204 miles west of Tallahassee, on several steamship lines and on the Louisville and Nashville, the Gulf, Florida, and Alabama, and the Pensacola, Alabama, and Tennessee railroads (Map: Florida, A 6). Situated on Pensacola Bay about 6 miles from the Gulf of Mexico, it has a landlocked, deep, and commodious harbor, the entrance to which is defended by forts Pickens and McRee. Fort San Carlos, built by the Spanish explorer Don Andres de Arriola in 1696, not far from the site of the present Fort

Barrancas, still stands. Near this fort and connected with it by an underground passage are the ruins of Fort Redoubt, constructed by the Confederate forces. Seven miles from the city is the United States Naval Aeronautic School. Pensacola Bay is the winter rendezvous of the submarine flotilla and the reserve torpedo fleet. Among the city's noteworthy structures are the Pensacola Hospital, the San Carlos Hotel, the laboratory of the State Board of Health, city hall, county courthouse, Blount Building, and the American National Bank Building. Pensacola is chiefly a commercial centre, its fish and lumber interests being particularly important. It has also a considerable trade in coal, cotton, naval stores, grain, etc. The commerce of the port in 1913 included exports valued at \$19,643,000 and imports to the amount of \$1,698,000. Pensacola adopted the commission form of government in 1913. The water works are owned by the city. Pop., 1900, 17,747; 1910, 22,982; 1915 (U. S. est.), 25,742.

Pensacola was settled permanently in 1696 by Spaniards from Vera Cruz. It was captured by the French in 1719, was restored to Spain in 1723, and passed into the hands of the British in 1763. In 1781 it was captured by a Spanish force under Governor Bernardo Galvez. During the War of 1812, owing to the assistance given here to the English, it was taken (1814) by General Jackson, who again in 1818 captured it on account of Spanish encouragement of hostile Indian attacks. The United States took formal possession in 1821, in pursuance of the Treaty of 1819. In 1861 the Confederates seized the navy yard here, but were unable to capture Fort Pickens, and in 1862 they evacuated the city. A destructive fire occurred in Pensacola in 1864.

PENSACOLA BAY. An inlet of the Gulf of Mexico on the coast of Florida near the western boundary of the State (Map: Florida, Insert, A 6). It is about 12½ miles long in an approximately northeast by southwest direction, and its average width is about 2½ miles. Escambia Bay, a considerable body of shoal water bordered by steep bluffs, extends northward from its eastern end, where there is also an eastward extension called East Bay. The entrance to Pensacola Bay is about ¾ mile wide and is obstructed by a bar and shoals through which a channel 30 to 32 feet deep is maintained by dredging. Inside the bay the water is from 4½ to 6½ fathoms deep, up to the city of Pensacola, a distance of about 7½ miles; and the inlet forms one of the best harbors on the Gulf coast.

PEN'SERO'SO, IL (It., the pensive). A poem by Milton, written probably in 1632 at Horton. It is the complement of *L'Allegro* (q.v.) and is an unrivaled description of the impressions made by scenes of nature and the effects of art and music on the mind of a thoughtful, cultivated man.

PENSILE (pén'sil) **NESTS** (from Lat. *pen-silis*, hanging, from *pendere*, to hang). Nests of birds woven in the form of a bag, cup, or hammock, and suspended by the rim from the twigs of a tree, bush, or other plant. Many birds construct such nests, which are not only safer than in most other situations, but usually most skillfully and beautifully made. Prominent American examples are the nests of the Baltimore and orchard orioles, of the vireos, and of certain warblers. In South America the

caciques and some humming birds, in Europe the titmice, and in Asia the tailor birds and weaver birds afford other examples in a great variety of forms and materials. See articles under the names of these birds; and **Plates** under **NIDIFICATION** and **WEAVER BIRD**.

PEN'SION (Lat. *pensio*, payment, weight, from *pendere*, to weigh out). A pension is an annual income granted by public authority, usually for an antecedent public service, military or civil. In earlier days the granting of pensions was a royal prerogative which was frequently abused. At the present time in England civil-list pensions are granted by the free grace of the sovereign and are frequently bestowed upon men of letters. Hereditary pensions granted in former times to national heroes and their descendants have been almost entirely commuted. Pensions are bestowed upon officers of the army and navy and to judges, as in the United States. Like most of the countries of Europe, England has a system of pensions for civil servants. A similar system is widely advocated for the United States. The theory of such pensions is generally that the assured provision for old age is a compensation for the low rates of pay which attach to the government service. In some of the European countries a system of pensioning workmen is now in force. (See **OLD-AGE PENSIONS**.) In the ordinary service of the United States retiring pensions are confined to the Federal judges and the officers of the army and navy. The former at the age of 70, after 10 years of judicial service, may retire on full pay. The maximum pay on the retired list for officers of the army and navy is 75 per cent of the active pay of their respective ranks. Congress has also by special act granted pensions to some of the widows of the Presidents.

Military Pensions in the United States. The system of military pensions in the United States had its germ in the Colonial epoch. The necessity of calling upon the inhabitants for armed defense against the Indians and other foes seemed to impose the necessity of providing at public expense for those who were disabled and for the families of those who perished in the struggles. In the Revolutionary struggle the troops were promised similar pensions, and officers who should remain in the service till the end of the war were promised half pay for life. The Continental Congress was unable to fulfill this obligation. After the adoption of the Constitution Congress took up the matter of pensions and passed in 1792 a general pension law. Successive laws were passed improving the machinery for granting pensions and enlarging the number of claimants, but no increase of rate was granted until 1816, when the rate of a full pension was raised from \$5 per month to \$8. The application of the law was at the same time extended to those who had fought in the War of 1812.

The principle of service pensions was introduced by the Act of March 13, 1818. All survivors of the Revolutionary army or navy who had served until the close of the war, or at any period of the struggle for at least nine months, were entitled, if in needy circumstances, to pensions for life. For privates the rate was fixed at \$8 per month. The law was loosely worded and the door left wide open to fraud. The grants of pensions became a public scandal, and a law of 1820 required all pensioners and applicants to file a statement of property in proof of their

alleged indigence. Many were stricken from the rolls. Up to September, 1822, as many as 18,880 claims had been admitted, but at that time the number of pensioners was only 12,331, owing to the effect of the Law of 1820. In 1832 a law was passed which granted full pay for life to all who had served at least two years in the Revolutionary War, and proportional payments to those who had served less than two years but more than six months.

In 1836 began a long series of acts in favor of the widows of Revolutionary soldiers, restricted at first to those who had married before the close of the Revolution, but gradually growing more liberal until pensions were granted to all, irrespective of the date of marriage.

A similar development of legislation occurred with respect to pensions growing out of the War of 1812 and of the Mexican War. A part of this legislation is of recent date and was affected by the more liberal views as to pension legislation which followed the Civil War.

The first law pensioning soldiers of the Civil War was a disability pension law of July 14, 1862. It provided for the disabled survivor and for the widows, orphan children, and dependent mothers of those who died by reason of any wound received or disease contracted while in the service of the United States and in the line of duty. Rates for total disability ranged from \$8 to \$30 a month, according to rank, and these were the rates accorded to widows. Successive laws beginning July 4, 1864, have increased the rates, adopting fixed rates for various kinds of disability.

A powerful stimulus was given to pensions expenditure by the passage of the Arrears Act in 1879. This provided that all pensions that had been granted or might hereafter be granted should date from the time of disability, provided application were made prior to the first of July, 1880. The operation of the law is shown by the fact that in 1881 the average of first payments to army invalids was \$953.62, and \$1021.51 to army widows.

A bill to establish service pensions for persons in dependent circumstances was vetoed in 1886 by President Cleveland. A similar bill was passed June 27, 1890, providing that all persons who had served 90 days in the war and who were suffering from any mental or physical disability of a permanent character which incapacitated them from performing manual labor may receive pensions of from \$6 to \$12 a month, proportioned to the degree of inability to earn a support. Widows of soldiers who served 90 days, who are dependent upon their daily labor for support, may receive \$8 per month. On March 15, 1904, an executive order, embodied later in the Act of April 24, 1906, was issued that when a claimant had passed the age of 62 he might be regarded as so far incapacitated to perform manual labor as to be entitled to a pension of \$6 a month, if all other legal requirements were properly met; after the age of 70, it may be assumed that the claimant suffers from complete disability and is entitled to \$12 monthly pension. An Act of April 19, 1908, increased the pension to which widows were entitled from \$8 to \$12, and an Act of May 11, 1912, gave pensions varying from \$13 to \$30 a month according to the length of service and the age of the pensioner. The maximum pension of \$30 was given to all survivors of the Mexican War and to all survivors of the Civil War who,

by reason of wounds received or disabilities resulting from service, were unable to perform manual labor.

In addition to the pensions granted under general laws, many claims, often rejected by the Pension Bureau, have been granted by Congress. The provisions of the general pension law were of course applicable to the war with Spain, and this brief struggle has already brought forth a considerable number of pensions. There were on the roll, June 30, 1913, 24,157 Spanish War invalids and 4858 widows and other dependents.

The development of the pension system in the United States can be seen from the following figures taken from the Reports of the Commissioner of Pensions:

YEAR	Number of pensioners	Paid for pensions
1866	126,722	\$15,450,550
1870	198,686	29,351,489
1875	234,821	29,270,407
1880	250,802	56,689,229
1885	345,125	65,171,937
1890	537,944	106,094,250
1892	876,068	139,394,147
1895	970,524	139,807,789
1900	993,529	138,462,131
1905	908,441	141,142,861
1910	921,083	159,974,056
1911	892,098	157,325,160
1912	860,294	152,986,434
1913	820,200	174,171,661
1914	785,239	172,417,546

This table indicates the considerable increase of pension expenditure between 1875 and 1880, due to the Arrears Act. This is brought out more fully by separating the first pension payments from the others, as is done in the following statement:

PENSION PAYMENTS

YEAR	First payments	Payments exclusive of the first
1878	\$2,992,352	\$23,538,439
1880	12,468,191	44,558,803
1883	29,906,754	29,915,481
1889	21,442,349	66,832,764
1890	38,721,866	66,806,314
1892	45,114,168	94,045,188
1896	11,289,278	126,925,483
1900	9,828,525	128,638,005
1905	8,040,064	132,202,797
1909	6,489,416	155,484,288
1910	4,858,504	155,115,552
1911	4,842,925	152,482,235
1912	4,096,502	148,880,032
1913	18,250,225	155,921,436
1914	4,856,614	167,560,932

This statement shows the great increase in first payments immediately following the passage of the Arrears Act and its subsidence until 1890, when the great number of new pensioners increased such payments to a large extent. Our first table showed the rapid increase of the pension roll after 1890. At present we have in fact two systems of pensions—one under the general law and the other under the Law of 1890. Under the general law there were 124,644 on the rolls in 1913 on account of service in the Civil War, and under the Law of 1890, with its modifications of 1908 and 1911, there were 628,169 pensioners.

The Commissioner of Pensions gives in his

report for 1913 the following statement of the aggregate cost of pension expenditure since July 1, 1790:

Revolutionary War (estimated).....	\$70,000,000
War of 1812 (service).....	5,923,014
Indian Wars (service).....	12,241,276
War with Mexico (service)....	47,632,572
Civil War.....	4,294,596,944
War with Spain and Philippine Insurrection	42,185,231
Regular Establishment.....	28,461,370
Unclassified.....	16,499,419
	\$4,557,539,824

Glasson, *History of Military Pension Legislation in the United States* (New York, 1900); *Laws of the United States Relating to Army and Navy Pensions* (Washington, 1912); Hopkins and Company, *Manual of Law for the Use of the Enlisted Men of the Army, Navy, and Marine Corps of the United States* (2d ed., ib., 1914). See CHEST, NAVAL; OLD-AGE PENSIONS; TEACHERS' PENSIONS.

PENTACRINUS (Neo-Lat., from Gk. *πέντε*, *pente*, five + *κρίνον*, *krinon*, lily). A genus of stalked crinoids living in the deeper waters of the modern ocean and found fossil in rocks of Triassic to Pliocene age. The calyx is small, with slender arms that branch innumerable times to form a beautiful feathery head. The stem is long, pentangular in section, and provided with numerous prehensile cirri which constitute organs of attachment to various foreign objects. *Pentacrinus* was extremely abundant in the Jurassic seas of Europe, and many slabs bearing numerous fine examples have been obtained from the Liassic rocks of Württemberg. The stems seem to have been of great length, one of them having been traced through many convolutions for about 70 feet. Though so large, the entire structure is extremely delicate. In some cases several individuals of various degrees of development and age have been found attached to pieces of fossil wood, which must have been originally floating logs drifting about the surface of the ocean and supporting the sessile pentacrinids. See CRINOIDEA.

PENTADACTYLON. See TAYGETUS.

PENTAGON (Lat. *pentagonium*, from Gk. *πεντάγωνον*, *pentagōnon*, pentagon, neut. sing. of *πεντάγωνος*, *pentagōnos*, five-cornered, from *πέντε*, *pente*, five + *γωνία*, *gōnia*, angle). A polygon (q.v.) of five sides. A pentagon in the form of a star of five rays is called a *pentagram* (*πέντε*, five, *γραμμή*, line). This figure was used as a

badge by the members of the Pythagorean school, and is said to have symbolized health. In the figure, if A, D, B, E, C, A are connected in order, a regular convex pentagon is formed and the sides of the pentagram become diagonals of the pentagon and divide one another in golden section (q.v.). Whence, in the above illustrated pentagram, Q divides AB and P divides BA in golden section, and the figure may be constructed from this relation.

PENTAGRAM. See PENTAGON.

PENTAMERON (Neo-Lat., from Gk. *πέντε*, *pente*, five + *ἡμέρα*, *hēmera*, day), THE. One

of the best of the *Imaginary Conversations* by Walter Savage Landor (1837). The participants are Petrarch and Boccaccio, who discuss the great Italian writers of the fourteenth century.

PENTAMERUS (Neo-Lat., from Gk. *πενταμερής*, *pentamerēs*, having five parts, from *πέντε*, *pente*, five + *μέρος*, *meros*, part). A group of hinged fossil brachiopods in which the shells are characterized by a more or less distinctly marked division of their interiors into five chambers by radiating septa that arise from the umbonal region. The type of the genus is *Pentamerus oblongus*, an oval to oblong smooth-surfaced shell that is characteristic of the Upper Silurian rocks of North America and Europe. With this typical species have been associated a number of forms that are now recognized as more properly belonging in other genera. Such are: *Gypidula galeata*, a very characteristic species of the Lower Helderberg limestone; *Pentamerella arata*, a strongly plicate shell of the Lower Devonian; *Camerophoria*, an Upper Devonian to Permian genus which strongly resembles the rhynchonellids; and *Capellina*, *Clorinda*, *Amphigena*, *Conchidium*, *Stricklandina*, all of which are important horizon markers in the hands of the expert paleontologist. See PLATE OF BRACHIOPODS.

PENTAMETER (Lat., from Gk. *πέντε*, *pente*, five + *μέτρον*, *metron*, measure). The name of a verse composed of five feet or measures. Its most frequent use is in iambic verse. The iambic pentameter is employed for the dialogue of Greek plays, and in English is used for two of the most popular forms, blank verse and the heroic couplet. In the Spenserian stanza, also, it supplies all verses except the last. The dactylic hexameter in Greek and Latin poetry alternates with the pentameter to make up the common form known as elegiac verse.

PENTATEUCH (Lat. *Pentateuchus*, *Pentateuchum*, from Gk. *πεντάτευχος*, *pentateuchos*, consisting of five books, from *πέντε*, *pente*, five + *τεῦχος*, *teuchos*, tool, case, book roll). A designation of the five books in the Hebrew Bible ascribed by tradition to Moses. It has been suggested that *τεῦχος* refers to the case, sheath, or box in which each roll was kept; but the term *Pentateuch* occurs for the first time in Ptolemy's letter to Flora (Epiphanius, *Haer.* xxxiii, 4), written c.150 A.D., and at that time *τεῦχος* is likely to have meant simply book roll. Tertullian writes *Pentateuchus*. In the Old Testament the work is called *ha-torah* (the law), the book of the law, the law of Moses, the book of Moses, the law of Yahwe, or the law of God. In later times it was sometimes called *hamisha humshe ha-torah* (the five fifths of the law). While it is not known how old the division into five parts is, it certainly antedates the Greek version made in the middle of the third century B.C. The Jews named each book by the opening word, though Numbers was sometimes called "the fifth of musterings" and Deuteronomy "the repetition of the law." The English titles, Genesis, Exodus, Leviticus, Numbers, and Deuteronomy, are derived from the Latin Bible, which took them from the Greek version. Some passages in the Talmud, such as *Shabbath* 115 b, 116 a, mention a division into seven books, but it is not known what its basis was. From the contents it would indeed be natural to divide it into seven parts, viz.: (1) Gen. i-xi; (2) Gen. xii-1; (3) Ex. i-xix. 2; (4) Ex. xix. 3-Num. x. 10; (5) Num. x. 11-xx. 21;

(6) Num. xx. 22-xxxvi. 13; and (7) Deuteronomy.

The Pentateuch gives the impression of unity. There seems to be a definite plan. The different parts relate in natural order the origin of the world and the human race (Gen. i-xi); the family history of the patriarchs (Gen. xii-l); the life of Israel in Goshen, the deliverance from bondage, and the escape (Ex. i-xix. 2), the stay at Sinai and the legislation there (Ex. xix. 3-Num. x. 10); the departure for Kadesh Barnea and the sojourn in that place (Num. x 11-xx. 21); the conquest of the country east of the Dead Sea and the Jordan (Num. xx. 22-xxxvi. 13); and the last exhortations of Moses, his death and burial (Deut i-xxxiv).

Despite its length the story of the sojourn at Sinai and the legislation shows a certain logical arrangement. A covenant between Yahwe and Israel is established on the basis of decalogue and covenant code (Ex xix 3-xxiv. 11), the command is given to construct a sanctuary (Ex xxiv 12-xxxv 18); the bull worship is repudiated (Ex xxxii-xxxiv); the sanctuary is then constructed (Ex xxxv-xl), instructions are given concerning sacrifices (Lev i-vii); priests are consecrated to offer them (Lev. viii-x), various minor codes dealing with the consecration of the people are given (Lev. xi-xvi, xvii-xxvi, xxvii), the holy army is mustered; Levites are elected as assistants and the unclean excluded (Num i-vi 6); offerings are received to pay for the sanctuary, and preparations are made for departure (Num vii-x. 10).

The grouping of the material seems, in the main, to be methodical and not accidental. Inclusion and exclusion, proportion and emphasis, appear to reveal a principle of selection and arrangement. A persistent purpose is evinced by the emphasis on certain thoughts, such as the obligations to keep the Sabbath, to abstain from blood, to practice circumcision, to live a holy family life, and to observe a cult ordained by Yahwe, and the rights of Israel to Canaan, and of each Israelite to a share in the land.

On the other hand, there are divergences of style and language, thought and historic perspective so marked as to deserve the most careful consideration. There are two widely differing accounts of the creation and certain inconsistencies in the story of the flood. Emphasis on the thought is not sufficient to explain the three repetitions (Gen xii, xx, xxvi) of the same story of a patriarch's wife; and the chronology adopted presents peculiar difficulties. The two accounts of Hagar's flight (Gen. xvi, xxi) have the appearance of being duplicates. Different episodes are related to explain the name of Isaac (Gen. xvii, xxi) and of Bethel (Gen. xxviii, xxxv). Jacob is twice renamed (Gen xxxii. 29, xxxv. 10). The story of Judah and Tamar (Gen. xxxviii) breaks the connection of the Joseph story. In the story of Moses there are contradictory statements concerning his immediate ancestry (350 years, Ex vi. 16-20, 400 years, Gen xv 13; 430 years, Ex. xii. 40); his tribe (22,000 Levites, Num iii 39; 23,000, 38 years later, Num xxvi 62, but in his own generation only a few families, Ex vi. 16 ff.); his father-in-law, who is called Reuel in Ex. ii. 18 ff. and Jethro in Ex iii. 1, iv. 18, xviii. 1; and his brother Aaron, who, according to Num. xx. 22, dies in Mount Hor, according to Deut. x 6 in Moshera in Ex. xviii. 13 ff. the plan of appointing judges originates with

Jethro, in Deut. i. 9 ff. with Moses. Yahwe wrote the Decalogue according to Ex. xxxi. 18, Deut. v. 22; Moses wrote it according to Ex. xxxiv. 27. Deut. x. 5 states that Moses made the ark; Ex. xxxvii. 1 that Bezaleel made it. Moses is represented as pitching his tent outside the camp in Ex. xxxiii 7 ff., while in Num. ii 17 it is said to be in the centre of the camp. The statement that at the time of the exodus there were 600,000 armed men in Israel (Ex. xii. 37, Num. xi. 21), strongly supported by the detailed census of the second year giving 603,550 besides 22,000 Levites (Num. i) and that of the fortieth year giving 601,730 besides 23,000 Levites (Num. xxvi), arguing a population of about two millions and a half, places such obstacles in the way of imagining Israel's life in Goshen, the flight from Egypt, and the sojourn in the wilderness, as well as the ministry of Aaron and his two sons to so great a multitude, that it seems to be a later addition to the original story. There is a curious anticipation of the result of the first census (Num i) in Ex xxxviii 26.

The legislative portions of the Pentateuch present very different and contradictory injunctions on many important points. Thus, the Covenant Code (Ex. xx. 23-xxiii. 33) sanctions a multiplicity of shrines, while Deut. xii forbids all sacrifices except at the central sanctuary, the sacrifices and the feasts differ in name, character, and number in different codes, Deuteronomy knows no distinction between Levites and priests, while according to Num. xviii 3 the Levites must not come near the altar lest they die, in Deuteronomy tithes are used for sacrificial banquets and every third year for the relief of the poor, while in Num. xviii 21 ff the tithes are given annually to the Levites, who give a tenth to the priests, in Num. xviii the priests alone have a right to eat of the firstlings, in Deuteronomy they are eaten by the people and the Levites; in Deuteronomy the Levites have no landed property, in Num. xxxv 1 ff 48 cities are assigned to them. There are many repetitions. The Decalogue is given twice (Ex. xx; Deut. v), and again, in a different form, Ex. xxxiv, the dietary laws of Lev. xi are repeated in Deut. xiv. Finally, Joshua is twice designated as Moses' successor (Num. xxvii. 12 ff., Deut. xxxi). These are only a few of the instances. It is difficult to say how far some of these inconsistencies may be owing to textual corruption, but it does not seem probable that even the most radical emendation of the text will ever succeed in concealing the marks, in style and thought, of the composite character of this work.

Belief in the Mosaic authorship of the entire Pentateuch is at least as old as the Chronicles, or the third century B.C. (2 Chron. xxiii 18, xxv 4, xxx 16, xxxiii 8, Ezra iii 2, vi 8, Neh. xiii 1.) How and when it originated cannot be determined. There is no claim in the Pentateuch itself, and Moses is referred to throughout in the third person. Sometimes Moses is spoken of in such a manner as to suggest that it is the testimony of another writer, as e.g.: "this is the Moses who brought Israel out of Egypt" (Ex. vi 26); "the man Moses was great" (Ex. xi 3); "the man Moses was meek above all men on the earth" (Num. xii 3), and "there never arose a prophet again in Israel like Moses" (Deut. xxxiv. 10). Probably the allusions to Moses as the author of some particu-

lar sections led to the notion that he had written the whole work. In Ex. xvii. 14 Moses is told, "Write this in a book"; in Ex. xxiv. 4 we read, "And Moses wrote all the words of Yahwe," probably referring to the Covenant Code; in Ex. xxxiv. 27 Yahwe says, "Write thou these words," and in verse 28 continues, "He wrote upon the tables the words of the covenant, the ten words"; in Num. xxxiii. 2 it is stated, "Moses wrote their goings out according to their journeys"; in Deut. xxx. 9 it is said, "Moses wrote this law," apparently referring to the Deuteronomic law; and in Deut. xxxi. 22, "So Moses wrote this song," referring to Deut. xxxii. The fact that some parts were thus distinctly said to have been written by Moses very naturally raised a presumption that other parts also came from his hand. Similarly the whole Psalter came to be ascribed to David, the whole Book of Proverbs to Solomon, and the two Books of Samuel to Samuel, though other authors besides David and Solomon are mentioned in Psalms and Proverbs, and the larger part of the history in 1 and 2 Samuel belongs to the time after this prophet's death.

The Mosaic authorship is accepted in Ecclus. xxiv. 23, and is presupposed in the Book of Jubilees. The most natural interpretation of the passages in the New Testament referring to "the law of Moses" (Luke xxiv 44), "the book of Moses" (Mark xii. 26), Moses as speaking (Acts xv. 21, 2 Cor. iii. 15), or giving certain laws (Matt xix. 7; Mark vii. 10, Luke xv. 24; John vii. 19; Heb. vii. 14, x. 28; Rom. x. 5, 19), is that the authors regarded the Pentateuch as written by Moses. Philo believed that Moses wrote the account of his own death and burial by way of prophecy (*De Vita Mosis*, ii, 179), and Josephus, who shared this view, gave as the reason that "Moses feared lest, because of his extraordinary virtue, men would say that he had been translated into the realm of the divine" (*Ant.*, iv, 8, 48). According to Baba-bathra 14 b Moses was the author of the Pentateuch, except the last eight verses, which were added by Joshua. This opinion has been held by the synagogue until modern times and is still adhered to by orthodox Jews. It was accepted by the Roman Catholic church also and was ably defended by many of its scholars, though a final decision of the sense in which the Pentateuch is the work of Moses was not reached until the report of the Biblical Commission appeared on June 27, 1906. It maintains that Moses is the author of the Pentateuch, but makes it permissible to believe that he may have used previously existing documents; that there may be post-Mosaic additions; that the Hebrew text has not been preserved in such a manner as to give us assurance that we possess everywhere the original reading; and that, consequently, within certain limits, textual and literary criticism is justifiable. Many Protestant denominations have officially or semiofficially expressed their adherence to the traditional view; but at present there is a tendency to regard the question as open and to allow scholars full freedom to seek for a satisfactory explanation. The defense has aimed at disclosing the weaknesses of the various systems of critical analysis, discovering archaeological evidence favorable to tradition, reconciling alleged inconsistencies, and removing by textual criticism the objections against Mosaic authorship. When the uncertainty of the Masoretic

text is admitted, the original form and extent of the work ascribed to Moses are, even on this standpoint, left in a measure to the idiosyncrasies of subjective judgment.

In 4 Ezra xiv. 21 ff., written c.95 A.D., Ezra is represented as having dictated, in a state of inspiration, not only the Pentateuch but all the 24 books, and also 70 other sacred books. That the lost Pentateuch was restored by Ezra through prophetic inspiration was also the view of Clement of Alexandria, Tertullian, and Chrysostom, while Irenaeus, Basil, Jerome, and Theodoret seem to have thought of an authoritative revision. In certain early Christian circles the conviction existed that the current text contained post-Mosaic additions, as is seen from Ptolemy's letter to Flora, the *Clementine Homilies* (iii, 47), and the testimony concerning the Nazareans by John of Damascus (*Haer.* xix). Celsus appears to have suggested several authors. Abélard expressed to Héloïse his doubts as to the last verses of Deuteronomy. The Bogomiles, who severely criticized the Pentateuch, probably rejected the Mosaic authorship also. Isaac ben Jasos (982-1057) assigned Gen. xxxvi to the time of Jehoshaphat. Ibn Ezra (1088-1167) hinted at additions later than Moses' time in his comments on Deut. i. 1. Carlstadt (1520) thought it a defensible view that Moses was not the author of the Pentateuch, and Luther considered it a matter of indifference. Masius (1574) suggested interpolations in the Pentateuch, and thought that Ezra had some part in the composition. This was also the view of Pereira (1594 ff.), Bonfrère (1625), and Episcopus (1650). Hobbes (1651) maintained that the Pentateuch was post-Mosaic, but that Moses wrote all that is distinctly claimed for him. La Peyrère (1655) suggested diverse authors. Spinoza (1670) regarded the Pentateuch as a part of a great historic work written by Ezra, who used documents of different periods. Richard Simon (1678) suggested the use of memoirs by inspired prophetic archivists of different periods. Le Clerc (1685) thought of private documents rather than public annals, and sought to discover the purpose and plan of the author, whom he conjectured to be the priest of Bethel mentioned in 2 Kings xvii. 24 ff. The view that Moses used earlier documents, that the Pentateuch contains many sections later than his time, and that only those parts distinctly claimed for him can be considered with any degree of assurance as his work, frequently expressed before the eighteenth century, is still held by some scholars. With the growth, however, of the conviction that the story of Moses shows the same composite character as Genesis, that Deut. xii-xxvi, the exhortatory addresses (Deut. i-xi), and the Song of Moses (Deut. xxxii), said to have been written by him, reveal unmistakable signs of a later time, and that the Semitic alphabet was not yet invented at the period to which he is assigned, an increasing number of investigators have been forced to the conclusion that no part of the Pentateuch can have been written by Moses.

To account for the facts which seem to point to a plural authorship various theories have been propounded. The following may be mentioned: (a) *Interpolation Theory*.—Most of the earlier dissenters from the traditional view maintained that, in course of transmission, certain glosses, corrections, or longer interpolations had attached themselves to the Mosaic original.

This theory was held also by apologists like Huet (1679), Bossuet (1679), and Witsius (1692), and was accepted by Le Clerc in 1693. It is held to-day by many Catholic and Protestant scholars, but there is much difference of opinion among them as to the extent of the interpolations. (b) *Fragment Theory*.—La Peyrère and Spinoza looked upon the Pentateuch as a collection of fragments, Astruc also counted a number of such unrelated to the documents he supposed he had discovered. Fulda (1791) thought that fragments were brought together, first in the age of David and afterward by Ezra. The theory was developed by Geddes (1792 ff.), Vater (1802-05), and defended by Hartmann (1831) and Bohlen (1835). (c) *Early Document Theory*.—That actual documents were used by Moses had been suggested by Simon, Le Clerc, Vitranga (1722), and others. But, except in the case of the two accounts of creation, no attempt seems to have been made to separate these sources before Astruc (1753), who used as a clew the difference of the divine names, Elohim and Yahwe. More or less independently, Eichhorn (1779 ff.) reached the same conclusions. Ilgen (1798) ascribed 17 fragments to 3 authors, 1 Elohist, 2 Elohist, and 1 Yahwist. These scholars dealt only with Genesis and Ex. i-ii, and believed that Moses had used the documents discovered. (d) *Supplement Theory*.—Since the framers of the fragment theory had taken into consideration the whole Pentateuch, it was natural that those who rejected it should consider the possibility of a continuance of the Genesis documents in Exodus-Numbers. This was done by Ewald (1831), who proposed to regard the Pentateuch as composed of an Elohist groundwork, supplemented by a Yahwist and brought by an editor into its present shape. Bleek (1836) ascribed the Yahwistic supplements to the editor. This theory was ably presented by Tuch (1838), and was accepted by De Wette (1840), Lengerke (1844), and Delitzsch (1852). Ewald subsequently modified it by assuming four narratives edited by the Yahwist, and in a somewhat different way this view was accepted by Knobel (1861) and Schrader (1869). (e) *Later Document Theory*.—A certain literary unity was secured through the Elohist groundwork, but concerning the elements that attached themselves to it there was no agreement after the simpler form of the supplement theory had been abandoned. Hupfeld's examination of the sources of Genesis (1853), which again led to a division between Ilgen's 1 Elohist, 2 Elohist, and 1 Yahwist, gave the impulse to a definite ascription of Exodus-Numbers also to these three authors. The distinct character of Deuteronomy, already seen by De Wette (1805), was clearly brought out by Riehm (1854). Graf's attempt to separate the legal and historical parts of 1 Elohist, or the Priests' Code, was given up by himself in 1869; and after Colenso's (1862 ff.) criticism of the subject matter Nöldeke (1869) defined more clearly its extent and character. Especially by Wellhausen (1876 ff.) and Kuenen (1877 ff.) the critical analysis into four documents, J, E, D, and P, was presented in such a manner as to win wide approval. Budde (1883) suggested a 2 Yahwist. Though differing as to the age of the documents, Dillmann (1886 ff.) accepted the analysis in the main. Bacon (1893-94) endeavored to separate more sharply J and E. The adherents to this

theory have found it increasingly difficult to maintain the unity of the assumed documents. A tendency has developed to dissolve the sigla J, E, D, and P into symbols representing schools of writers. About twoscore authors of connected history and redactors have been separated, and many more writers of unrelated fragments and independent songs, stories, and minor compends of law have come to light. Passages that once were regarded as typical of P have been claimed as essentially the property of J², as has been recently done regarding Gen. i-ii. 4a by Budde (*Alttestamentliche Zeitschrift*, xxxv, Giessen, 1915). The insistence, especially by Gunkel (cf. *Genesis*, 3d ed., Göttingen, 1910), on discovering the original story-tellers, singers, and legislators, has tended to diminish the importance of J, E, and P, and added to the impression of a movement in the direction of some new theory. (f) *Accretion Theory*.—If the increasing disintegration of the assumed documents tended here and there to undermine confidence in the analytic processes, the implicit reliance upon the Masoretic text, so minutely parceled out by the critics, did not enhance it. The exigencies of the document theory seem to prevent its supporters from applying to the Pentateuch the same canons of textual criticism that they resolutely follow in dealing with other biblical books. A searching criticism, such as that begun by Ilgen, Vater, Pluschke, Frankel, Geiger, and Popper, has been resumed in recent years. From different standpoints and in different ways Klostermann, Hoberg, Redpath, Wiener, Dahse, Eerdmans, Schmidt, and Pope have called attention to the inadequacy of the criteria relied upon, particularly as to the form of the divine name, in view of the various ancient witnesses to the text, but also as to the language and thought. The accretion theory, as it has been called by Schmidt, differs from the fragment theory in not regarding the Pentateuch as an ill-arranged collection of isolated fragments, but as the natural result of the growing together, under the influence of a crystallizing tradition, of originally separate parts, some of them quite extensive, into a fairly well-ordered composition, and a gradual increase of this production by glosses, explanations, duplicates, alterations, and more or less extensive interpolations, often giving a new coloring to the narrative and a new scope to the legal enactment. The object of scientific analysis from the standpoint of this theory is not to find out how the present text, with clews derived from it, may be divided into a series of documents running along parallel lines, but rather to seek, with the ordinary methods of textual and literary criticism, for the earlier forms of a text of which the Masoretic is the last type, and for the manner in which its several parts dealing with different subjects grew together into a connected whole.

According to the biblical chronology the wilderness period falls in the first half of the fifteenth century B.C. The name of the Pharaoh of the oppression is not given, but the references to the store cities Pithom and Raamses naturally led to the assumption that Ramses II, the builder of these cities, was the oppressor of the Hebrews. His date (c.1310-1244 B.C.), however, is at least two centuries too late, while, in view of our present historic knowledge, the intrinsic probability favors the supposition that the Hebrews began to invade Syria in the fif-

teenth century B.C. (See JEWS.) Our earliest approximately datable inscription in the Semitic alphabet may belong to the tenth century, and it is not impossible that its origin goes back to the twelfth (see ALPHABET), but there is no evidence that permits us to assume its existence in the fifteenth. It is extremely hazardous to suppose that the Pentateuch or any part of it was originally composed in hieroglyphics or in cuneiform signs. While the originals of the early legends in Genesis may have been read and copied in cuneiform signs by Amorites in Syria, we have as yet no evidence that Hebrew ever was written in these characters, and the Tell el Amarna letters (q.v.) are written in a Babylonian patois. As long as the so-called priestly writer was supposed to have furnished the groundwork, a comparatively early date was generally assigned to this stratum. But already Gramberg (1829), Reuss (1833), Vatke (1835), and George (1835) assigned Leviticus-Numbers to the exile or the postexilic period, and Graf's position in 1866 was only a modification of this view. Through Kuenen and Wellhausen the postexilic date of the whole Priests' Code became accepted in wide circles, as well as their view that J was older than E. According to the system most in vogue at present, J¹ was written c.850, J² about a century later, E¹ c.750, E² about a century later, D c.620, and the various strata of P between the exile and Ezra. There are still scholars who regard E as earlier than J, and P as preëxilic. The differences have been in a measure composed by the assumption that some elements in E may be older than J and some in J older than E, and that some parts of P may be preëxilic, other parts postexilic. While the Deuteronomic Code is generally supposed to have been written not long before its discovery in 620, there are some who regard it as a product of an earlier age.

In view of the far-reaching changes that the text has clearly undergone in course of time, the tentative and provisional nature of any date suggested must always be borne in mind. Certain peculiarities of the Vulgate indicated by recently collated manuscripts throw a doubt even on the generally accepted thesis that the present consonantal text goes back to the end of the first century A.D., as Hugh Pope has shown. A comparison with the Greek version and the Samaritan recension leaves no doubt that extensive additions and important changes were made after the middle of the third century B.C. The text preserved by the Samaritans seems to be later than that represented by the Greek version and earlier than the Masoretic recension. Whether "the writer of the law of the God of heaven" (Ezra vii. 21) designates Ezra as an author or a mere copyist cannot be determined, but it is a plausible theory that he wrote out a copy of the law more complete than any copy existing before his time, embodying many glosses, corrections, notes, and possibly somewhat extensive additions that had grown up in connection with the reading of the law or developed independently in priestly circles. There seems to be no reason to doubt the essential correctness of the account in 2 Kings xxii-xxiii nor can the substantial identity of Deut. xii-xxvi with Josiah's law book be questioned, despite the differences between his reforms and the letter of the law urged by Kennett. (*Journal of Theological Studies*, Cambridge, 1914.) How the code found in 620 appeared in detail, and when

it was written, may be doubtful. But it seems evident, both from the account itself and from the history recorded in Judges-Kings, that it was absolutely unknown before its discovery, and consequently that a Pentateuch including it could not have existed in the centuries preceding its publication. It was probably provided with the prefatory addresses some time after 620 and appended to Num. x-xxxvi. The story of Moses in Midian and the Sinaitic legislation may go back, in a primitive form, to the age of David and Solomon, though it was later expanded so as to give an Egyptian setting to part of the narrative and to incorporate diverse compends of sacrificial, ritual, and dietary prescriptions, made necessary by the cult in the temple of Solomon, the other sanctuaries, and the temple of Zerubbabel. Some of the legal sections, such as the Covenant Code, may indeed have been formulated as early as the time of the Judges. The similarities to the Code of Hammurapi (q.v.) may be accounted for by the circumstance that through long occupation and cultural influence Babylonian law had to some extent become the common law of the Amorites and the Canaanites, which the invaders would naturally follow as they came into possession of the soil; and local variations and the persistence of tribal customs from the nomadic period would tend to explain the dissimilarities.

There is an advance, as has been pointed out by Söderblom (*Gudströms uppkomst*, Upsala, 1914), from the conceptions of the divinity in the patriarchal stories to that in the Moses story. This would be natural if the former had been already written down, in their simplest form, before the kingdom. The transfer of Amoritic stories concerning the beginnings of things, frankly polytheistic in nature and ultimately of Babylonian origin, would be most readily accounted for in this period also. In any attempt to explain the particular form songs, sagas, and laws assumed, the peculiar character of Jewish thought and its reaction against the environment must always be considered. A vast amount of work remains to be done in the field of Pentateuchal criticism. Of what has been accomplished the most important is the new estimate of Israel's great law book, which recognizes that it reflects a long historic development, that it is a significant effort to solve the riddle of the past and to order a people's life by righteous rules, and that it contains a wealth of valuable suggestions.

Bibliography. For the history of Pentateuchal criticism: A. Westphal, *Les sources du Pentateuque* (3 vols., Paris, 1888-92); H. Holzinger, *Einführung in den Hexateuch* (Freiburg, 1893); C. A. Briggs, *The Higher Criticism of the Hexateuch* (New York, 1897); Carpenter and Harford-Battersby, *Composition of the Hexateuch* (London, 1900); Carl Steuernagel, *Einführung in den Hexateuch* (Göttingen, 1900). For various phases of criticism: Abraham Kuenen, *The Hexateuch* (Eng. trans., London, 1886); Julius Wellhausen, *Die Komposition des Hexateuchs* (3d ed., Berlin, 1899; Eng. trans. of earlier ed., Edinburgh, 1885); Bernhard Luther, in Eduard Meyer, *Die Israeliten* (Halle, 1906); O. Prokisch, *Das nordhebraische Sagenbuch, die Elohimquelle* (Leipzig, 1906); A. H. Klostermann, *Der Pentateuch* (ib., 1907); Adalbert Merx, *Die Bücher Moses und Josia* (Tübingen, 1907); B. D. PENTATH'LON (Gk. *πένταθλον*, quintuple contest, from *πέντε*, *pente*, five + *ἄθλον*, *athlon*, contest). See OLYMPIC GAMES.

PENTATONIC SCALE. The oldest musical scale, consisting of a progression of whole tones and two minor thirds, as follows: a b d e g. Taking a as the fundamental or central tone, and adding to it the first and second fifths above and below, we can readily see how this, to our ears, strange succession of tones was obtained as a basis for a system of music. Thus

we have g d a e b. For a long time it had been regarded as a peculiar fact that Chinese and Celtic music should rest on this pentatonic scale. But recent investigations have proved that the oldest scale of the Greeks was pentatonic, and that the music of savage nations, irrespective of geographical distribution, rests on this same basis. In their efforts for characterization, some modern composers, especially impressionists, have made considerable use of this old scale.

PENTAUR (Egypt. *Pen-ta-were(t)*). An Egyptian scribe, who was formerly regarded as the author of the poem celebrating the valor of Ramses II in the battle fought against the Hittites at Kadesh on the Orontes. In this character he is the hero of Ebers's novel *Uarda*. It is now known, however, that he was merely the copyist of the papyrus (Sallier 3) in which the poem has been preserved. According to the first Sallier papyrus he was still living in the tenth year of Menephtah. Another Pentaure, who seems to have been a member of the royal family of Egypt, is mentioned in the Turin judiciary papyrus as being concerned in the conspiracy against Ramses III. He was found guilty by the commission appointed to try the case and was forced to kill himself. Consult J. H. Breasted, *A History of the Ancient Egyptians* (New York, 1908).

PENTECOST (OF. *pentecoste*, Fr. *pentecôte*, from Lat. *pentecoste*, from Gk. *πεντηκοστή*, *pentēkostē*, fiftieth, sc. *ἡμέρα*, *hēmera*, day, from *πεντήκοντα*, *pentēkonta*, fifty). The Greek name of the second of the three chief festivals among the Hebrews, in the Old Testament commonly called the Feast of Weeks. It received the name Pentecost from the fact that its celebration was determined by an interval of seven weeks or 50 days from the Passover. (See WEEKS, FEAST OF.) From the Jewish Synagogue it was introduced into the Christian Church and with special solemnity, as being the day of the descent of the Holy Ghost on the Apostles and of the

first solemn preaching of the Christian religion (Acts ii). From early times Pentecost has been regarded as one of the great festivals of the Christian year, and it was chosen as one of the times for the solemn administration of baptism. The English name of the festival, Whitsunday, is derived from the white robes in which the newly baptized were clad. It is regarded as specially sacred to the third person of the Trinity, to whose honor the services of the day are directly addressed. As a trace of its originally agricultural character, the practice prevails in the East as well as in the West of decorating the churches with evergreens and flowers, as is done in England at Christmas, and it is interesting to note also that the whole time intervening between Easter and Pentecost is celebrated in the Roman Catholic church with great solemnity. See PASSOVER.

PENTECOST, GEORGE FREDERICK (1842-). An American Presbyterian clergyman and author, born at Albion, Ill. He left Georgetown College to enter the Union army, in which he served as chaplain (1862-64). He then entered the ministry and between 1864 and 1887 was pastor of churches in Indiana and Kentucky, in Brooklyn and Boston. After evangelical work in Scotland and a special mission to English-speaking Brahmins in India, Dr. Pentecost was (1891-97) pastor of Marylebone Church, London, and (1897-1902) pastor of the First Presbyterian Church of Yonkers, N. Y. In 1902 he was appointed a special commissioner to China, Japan, and the Philippines to examine the missionary work of the Presbyterian and Congregational churches. He wrote: *A South Window* (1886); *Bible Studies* (10 vols., 1880-89); *Out of Egypt* (1884); *Birth and Boyhood of Christ* (1896); *Systematic Benevolence* (1897); *Precious Truths* (1898); *Christian Imperialism* (1902).

PEN'TECOST'AL CHURCH OF THE NAZ'ARENE', generally known as the HOLINESS CHURCH. An American church organization formed in 1907-08 by the union of religious bodies professing particularly the doctrine of entire sanctification of believers by faith, as a work of grace subsequent to and separate from justification. At the time of the union there were in all 230 churches, 575 ministers, and 12,000 communicants. The church conducts home and foreign missions, has a collegiate institute at North Scituate, R. I., and gives theological training in the Deets Pacific Bible College at Los Angeles, Cal., and Bible training in the Bible Institute and Training School at Pilot Point, Tex. The Texas Holiness University at Peniel, Tex., and the Arkansas Holiness College at Vilonia, Ark., are semiofficial institutions of the church. Its official organs are the *Beulah Christian*, Providence, R. I., the *Holiness Evangel*, Pilot Point, Tex., and the *Nazarene Messenger*, Los Angeles, Cal. At the close of 1914 there were reported to be 687 ministers, 708 churches, and 27,526 communicants.

PENTELICON, or **PENTELICUS** (Lat., from Gk. *Πεντελικόν* (sc. *ὄρος*, *mountain*), from *Πεντήλη*, *Pentelē*, name of a deme of Attica). A mountain range in Attica, about 3650 feet high, northeast of Athens, now called Mendeli. From the Persian wars onward quarries of white marble, on its southern side, were used for the chief buildings of Athens and for sculpture. Consult E. A. Gardner, *Ancient Athens* (London, 1902).

PENTHESILE'A (Lat., from Gk. Πενθησίλεια, *Penthesileia*). The daughter of Ares and Queen of the Amazons. In the latter part of the Trojan War she aided Priam and showed great valor. Achilles slew her and, in admiration of her deeds, desired to honor her with a tomb. The ridicule and offensive words of Thersites at this suggestion so provoked Achilles that he killed Thersites, whereupon Diomedes threw the Amazon's body into the Scamander.

PENTHEUS (Lat., from Gk. Πενθεύς). The son of Agave, daughter of Cadmus and successor of Cadmus on the throne of Thebes. He opposed the introduction of the Bacchic worship and, being discovered watching the orgies of the Bacchanals, was torn in pieces by his mother and sisters on Mount Cithæron. The *Bacchæ* of Euripides is based on this legend.

PENTLAND FIRTH. A channel connecting the Atlantic Ocean with the North Sea and separating the Orkney Islands from the mainland of Scotland (Map: Scotland, F 2). It is 14 miles long, 6 to 8 miles wide, and is crossed by a ferry line. Its navigation is dangerous, owing to eddies, rocks, and strong currents, which in the ebb and flow of tides reach a speed of 8 to 10 knots an hour; but it is lighted by several lighthouses and is used by a large number of vessels.

PENTREMITES, pên'trê-mî'têz (Neo-Lat. nom. pl., from Gk. πέντε, *pentê*, five + Lat. *remus*, oar). A genus of fossil echinoderms typical of the class Blastoidea. The Blastoids were crinoid-like animals that lived in abundance in the sea of late Paleozoic time. They resembled the crinoids in respect of the general plan of their organization, but they differed in that the calyx has only 13 principal plates arranged in very regular order, generally forming a bud-shaped head (whence the name), and in the absence of well-developed arms. In place of the arms there were very efficient pinules that screened the food from the water. The calyx is usually small, pear-shaped, ovate, or globose in form and more or less pentangular in section. The stem is seldom found attached to the calyx. About 20 genera and 150 species of blastoids are known, by far the larger proportion of which are American only.

The blastoids appear to have been derived from some of the more regular cystideans of Ordovician time. The earliest member of the group is *Troostocrinus*, an elongate slender species from the Niagara group of Tennessee. *Elacrinus* (*Nucleocrinus*) *vernuculi* is a well-known index fossil of the Lower Devonian limestones of the Central States. The blastoids attained great prominence in the Subcarboniferous of North America, especially in the St. Louis and Kaskaskia limestones of the Mississippi valley. Here the most prominent genus is *Pentremites*, which seems to be unknown in Europe, where it is represented in the Devonian rocks by an ancestral form, *Pentremitidea*. Consult Etheridge and Carpenter, *Catalogue of the Blastoidea in the Geological Department of the British Museum* (London, 1886), containing a full bibliography to the literature of the group, and K. A. von Zittel, *Textbook of Paleontology*, vol. i (Eng. trans. by C. R. Eastman, New York, 1900). See CRINOIDEA; ECHINODERMATA.

PENUM'BRA (Neo-Lat., from Lat. *pene*, *pene*, almost + *umbra*, shadow). When the shadow of an opaque object is thrown upon a surface at some distance from it by a light of

considerable apparent size, it is observed that the shadow is divided into two portions, a dark portion in the centre and a lighter portion surrounding it. The former is known as the *umbra*, or complete shadow; the latter as the *penumbra*, or partial shadow. A reference to the figure will

at once make plain their origin and relation; for if *S* be the illuminating body, *E* the object whose shadow is cast on the surface *ABCD*, it is seen that the small portion *UU'* receives (omitting all consideration of refraction, dispersion, etc., of light) no light from *S*, while the whole surface outside of *PPPP'* is completely illuminated. The point *P'* receives light from the whole of *S*; the point *P* is only half illumined, and that by the lower part of *S*, the illumination of the points becoming less and less as they approach *U'*, which is unillumined. The portion within *UU'* is the umbra, and that between the boundaries *PPPP'* and *UU'* is the penumbra, which, as we have seen, gradually shades from perfect light at the outer boundary to perfect darkness at the inner, so that it is almost impossible exactly to note its limits on either side. This phenomenon, it is evident, can occur only when the illuminating body is of such a size, real or apparent, as to make the angle *P'KU'* of sensible magnitude; and it is equally evident that the nearer the body *E* approaches the plane on which its shadow is cast, the larger is the umbra and the smaller the penumbra; while by increasing the distance between *E* and the plane, so that the point *L* shall fall between them, the umbra is made to vanish and the penumbra is increased. This is well illustrated by natural phenomena; the shadow of a man cast by the sun on the ground presents almost no penumbra; the shadow of the earth thrown by the sun upon space at the distance of the moon gives a penumbra many times as large as the umbra; and sometimes, when the moon is new at her apogee, e.g., her shadow cast upon the earth exhibits no umbra. Spectators on the earth who see a partial eclipse of the sun are situated within the penumbra, but within the umbra when they observe a total eclipse; while if the eclipse be annular, the umbra does not exist in the shadow cast by the moon on the earth's surface. See ECLIPSE.

PENZA, pên'zà. A government of central Russia, consisting of 10 districts and bounded by the Government of Nizhni Novgorod on the north, Simbirsk on the east, Saratov on the south, and Tambov on the west (Map: Russia, F 4). Area, about 15,000 square miles. The surface is undulating, intersected by numerous ravines and sloping towards the northwest. The district is watered principally by the Moksha, a tributary of the Oka, and the Sura, an affluent of the Volga, both navigable. The climate is severe, the mean annual temperature at Penza, the capital, averaging 39°. No

greater contrasts in landscape scenery are found anywhere in central Russia. Agriculture, the chief occupation, is favored by a soil of remarkable fertility. Rye, oats, and wheat are the leading cereals raised. Flax is cultivated to a considerable extent, gardening and stock raising are well developed. Modern farm methods are making some progress among the peasantry. The manufacturing industries employ over 12,000 men, and their products approximate in value \$10,000,000 annually. The chief manufactures are paper, flour, oil, and matches. Pop., 1913, 1,875,700, of whom about 90 per cent were Great Russians and the rest Mordvins and Tatars.

PENZA. The capital of the government of the same name in Russia, at the confluence of the Penza and the Sura, 440 miles by rail southeast of Moscow (Map: Russia, F 4). It is the see of a Greek Catholic bishop, has a monastery and a convent, a mosque, three Gymnasias, a Realschule, a normal school, two seminaries for priests, a technical school, a school of drawing, a medical school, and a picture gallery. The municipality owns the water works and directs a pawnshop. Paper, lumber, flour, and various iron products are the chief manufactures. Penza was founded in 1666. Pop., 1910, 79,552.

PENZANCE, pën-zāns'. A municipal borough, market, and seaport town in Cornwall, England, on the northwest shore of Mount's Bay, 26 miles southwest of Truro (Map: England, A 6). It is the most westerly town in England. The town, exceedingly picturesque in situation, stands on a finely curved shore, surrounded by rocky eminences, is famous for its mild climate, and is much sought as a health resort. Its esplanade, one of the finest in the west of England, commands charming land and sea views. The chief buildings are the town hall and corn market, and the chapels of St. Paul and St. Mary. Its educational institutions include mining and science schools, a geological museum, a school of art, the Free Library, and a public library with rare Cornish books. Woolen yarns and cloths are made, and the fisheries employ upward of 2000 persons. Agricultural produce, pilehards, china clay, granite, tin and copper ores, and vegetables produced in the vicinity are exported; and timber, iron, hemp, and hides are the chief imports. The harbor has two piers, dry docks and wet docks, and a lighthouse. The town owns much remunerative property, wharfs, modern docks, quays, markets, public baths, and water supply. Penzance, meaning "holy head," originated in a chapel to St. Anthony. Edward III gave it the grant of a weekly market, and in the fifteenth century it was described as "a place of ships and merchandise." The Spaniards burned and sacked the town of Penzance in 1595, and the place suffered from Fairfax in the Civil Wars. It enjoyed the privilege of a coinage charter from 1663 to 1838. Pop., 1901, 13,123; 1911, 13,478.

PE'ONAGE. A term used loosely to denote the system of labor formerly prevalent in Spanish America, especially in Mexico. The system originated in the desire of the Spanish government to protect the natives from the rapacity of their conquerors. In Mexico the Indians were early given all the privileges of minors and as such were exempt from compulsory military service, the payment of tithes, aside from a

moderate annual tribute, and certain ecclesiastical and legal restrictions, and the royal officials were especially charged with their protection. These privileges and exemptions, however, served equally well as a mark of inferiority, and their natural protectors often took advantage of their helpless political and social condition to force them into virtual slavery. The labor required of the *peones*, as these Indians were called, was of two kinds: the free labor (*obirajes*), a system under which the laborer served by definite contract, with the days of service, tasks, compensation, etc., strictly regulated by the laws of the Indies; and forced labor, as punishment for crime or debt. With the administration of the law in the hands of corrupt officials, it was comparatively easy to extend almost indefinitely the number of the second class, and with the requirement that each Indian must perform a certain number of days' work each year, the condition of laborers of the first class was far from being one of free contract. During the latter period of the Spanish rule many restrictions were adopted to prevent the Indians from falling into debt, and the conduct of employers was so strictly regulated that the condition of the natives was much better than during the first years of Mexican independence.

The principal evils of the system arose from the strict segregation of the Indians in separate villages, which kept from them any opportunities to advance by more intimate contact with a superior race, and which speedily nullified the first feeble efforts to educate them; and from the feeling of race contempt which their isolated and defenseless condition engendered in their masters. Though in a legal sense the institution itself long since disappeared, the name "peon" is still used to designate the laborer of native or mixed blood, and through his ignorance and credulity many of the worst features of the system are still fastened on him. The system as then prevailing in Mexico survived in New Mexico and Arizona a few years after the annexation of the Southwest to the United States, but was removed by national enactment March 2, 1867. In the early years of the twentieth century investigations of the convict-labor system of the South revealed the fact that at its worst, especially as applied to negro prisoners, it closely paralleled some of the most flagrant evils of early Spanish-American peonage, consequently that term has been used, though not with strict accuracy, to designate the condition of these convicts. Federal grand juries found a number of indictments against convict-labor contractors, and several were convicted. Negroes were arrested on trumped-up or indefinite charges, for vagrancy, etc., and fined; if unable to pay the fine they were sold to the highest bidder for six months or a year. At the expiration of the time of service they were rearrested. These abuses were connected with the system of hiring out convict labor to private contractors. See ALABAMA, *History*.

PE'ONY (OF. *pione*, *pioine*, Fr. *pivoine*, from ML. *peonia*, Lat. *pæonia*, from Gk. *παωνία*, *païōnia*, peony, from *Παών*, *Païōn*, *Παίδν*, *Paran*, the physician of the gods; so called because the plant was originally regarded as medicinal), *Pæonia*. - A genus of plants of the family Ranunculaceæ, natives of southern Europe, northern Africa, and Asia. The species are large, herbaceous or rarely half-shrubby perennials, often with tuberous roots. The half-

shrubby species are known as tree peonies. On account of the beauty of their large flowers, some of the species are extensively cultivated in gardens, and many varieties and hybrids have been originated. The common peony (*Paeonia officinalis*), a native of southern Europe, is the most generally cultivated species. It produces in early summer large solitary blossoms, usually red or crimson, but varying to white. The white peony (*Paeonia albiflora*), another favorite species, with beautiful white or pink and fragrant flowers, is a native of Siberia, where its roots are used by the Mongolian Tatars as a food. These two species are the parents of many cultivated forms. The Chinese peonies, a large group including many hardy double-flowered and fragrant varieties, are hybrids obtained by intercrossing various species. The term "Chinese peony," however, is often applied to several different species. The less common tree peonies are derived mainly from *Paeonia moutan* and *Paeonia lutea*, which latter is a comparatively recent introduction from China and is as yet not so well known as the other species. It begins to blossom in late spring and produces its yellow flowers for about a month. *Paeonia moutan*, the commonest of the tree peonies and much larger than the foregoing, attaining a height of 3 or 4 feet, is a native of California and Japan. It blossoms in spring and produces very large and handsome flowers, representing a wide range of shade and colors. It is often grown as a greenhouse plant for early spring blossoms. The tree peonies prefer a good, strong sandy loam. They require a rich soil, and applications of well-rotted cow manure are very advantageous to the growing plants. They are rather tender and in many localities require protection. The plants are propagated from cuttings at the base, usually made with a piece of the ripened stem, are potted in sandy soil, and placed in a cold frame or in a greenhouse. They are grafted in early fall also on the roots of *Paeonia albiflora* and *Paeonia officinalis*. The shoots for grafting are without a flower bud, and the grafts are potted in sand and kept in cold frames. The herbaceous peonies are commonly increased by divisions of the shoots in autumn or spring. New varieties are grown from seed. Consult L. D. Batchelor, *Classification of the Peony* (Albany, 1911), and C. S. Harrison (ed.), *Manual Giving Complete Directions for the Propagation and Cultivation of the Peony* (3d ed., York, Neb., 1914).

PEOPLE'S CHORAL UNION. See CHORAL SOCIETIES.

PEOPLE'S PALACE. An institution at Mile End, London, established to furnish the people of East London with facilities for education and recreation. In 1840 John B. Beaumont left a sum of money the income of which was to be spent in furnishing education and entertainment for the people in the neighborhood of Beaumont Square. This bequest was badly managed until Sir Edmund Hay Currie took the work in hand and added to the \$60,000 which remained the quarter of a million he had raised for its extension. In 1882 Walter Besant published his story, *All Sorts and Conditions of Men*, describing a "Palace of Delight." This novel suggested the name for the new enterprise, created a wider interest in the work, and emphasized the recreation idea, for the further development of which the means soon offered. Besant, as trustee, was closely connected with

the work. A central location was chosen, and Queen's Hall was formally opened by Queen Victoria on May 14, 1887. Classes in technical studies had already been opened in temporary buildings in October. Other buildings were added gradually. The institution contains, in addition to Queen's Hall, with its large organ and stage and a seating capacity of 4000, a library, classrooms, laboratories, machinery rooms, social rooms, reading rooms, a gymnasium, a swimming tank, and a winter garden. The activities are educational and social. The only religious work is that carried on by voluntarily formed branches of the Young Men's Christian Association. The main object is to furnish boys with a technical training, an opportunity to learn a trade, and wholesome entertainment. The Palace is primarily for the young, membership being limited to persons from 16 to 25 years; a junior section includes those from 13 to 16. There is a small membership fee, for which is received the privilege of attending concerts and other entertainments, the use of the library in the evening, and admission to clubs and classes. The membership the first year was 4200. In 1890 the Drapers Company took the management of the educational work, and two years later they decided to contribute £7000 annually, while the Charities Commission give £3500.

PEOPLE'S PARTY. See FARMERS' ALLIANCE; POPULIST PARTY.

PEORIA. An important manufacturing city and railway centre, the county seat of Peoria Co., Ill., 162 miles by rail southwest of Chicago, on the Illinois River, at the outlet of the expansion called Peoria Lake, and on the Chicago, Burlington, and Quincy, the Chicago and Alton, the Chicago, Peoria, and St. Louis, the Chicago, Rock Island, and Pacific, the Cleveland, Cincinnati, Chicago, and St. Louis, the Chicago and Northwestern, the Illinois Central, the Lake Erie and Western, the Toledo, Peoria, and Western, and other railways (Map: Illinois, E 4). The city covers an area of 9.4 square miles, the residential region being situated on an elevation overlooking the lake, while the business of the city is conducted on the plain bordering the river front. There are many miles of paved streets, an adequate street-railway system, and a thoroughly modern sewerage and drainage plant. The system of public parks and drives is well developed, aggregating about 400 acres. It includes Glen Park (103 acres), Bradley Park (140 acres), the Proctor Recreation Centre, and other parks. Among the city's noteworthy structures and monuments are the Proctor Old Folks' Home, Proctor Hospital, the public library, the law library, the country club, the Crèvecoeur Club, several memorials to soldiers and sailors who died in the Civil War, and the site of Fort Crèvecoeur. Educationally the city is represented by Bradley Polytechnic Institute and Spalding Institute. It is an important commercial centre, controlling a large trade by both rail and river, and in 1909 it ranked second among the cities of the State in the importance of its manufactures. In that year the value of its manufactured products was \$63,061,155 and of the invested capital \$24,945,147. In the 283 manufacturing establishments in that year the total number of persons employed was 7323, of which 5981 were wage earners. The manufacturing establishments include distilleries, glucose works, strawboard mills, wagon works, automo-

bile works, malting houses, breweries, wire-fence works, a peanut-roaster factory, agricultural-implement works, foundries and machine shops, lumber mills of various kinds, and flour mills. In the production of high wines Peoria ranks among the first cities of the United States, the output of its distilleries, according to the census of 1909, being \$45,671,028. A very small amount of whisky is made in Peoria, the high wines being sent to rectifying establishments to be changed into whisky.

The government is vested in a mayor, elected every two years, a council, and administrative officials, who are all, with the exception of the treasurer, city clerk, city attorney, and police magistrate—these being chosen by popular vote—nominated by the executive, subject to the consent of the council. The total revenue receipts in 1913 amounted to \$1,469,995. Peoria spent, in 1912, \$970,601 for maintenance and operation, the principal items being \$357,277 for schools, \$96,967 for the fire department, \$84,981 for the police department, and \$64,193 for municipal lighting. The valuation of all property was assessed in 1912 at \$22,084,481. Pop., 1880, 29,259; 1890, 41,024; 1900, 56,100; 1910, 66,950, including 8810 persons of foreign birth and 1569 negroes; 1914 (U. S. est.), 70,006. In 1902 North Peoria, which had a population of 2358, was annexed to Peoria proper.

In 1680 La Salle visited the site of Peoria and built near here Fort Crèvecoeur, which, however, was soon abandoned. Sometime in the eighteenth century French traders settled here. In 1812 General Craig of the United States army broke up their settlement, suspecting them of assisting the Indians. The present city really dates from 1819. In 1835 Peoria (named from the Peoria Indians) was incorporated as a town, and in 1845 it was chartered as a city. Consult Charles Ballance, *The History of Peoria* (Peoria, 1870), and J. M. Rice, *Peoria, City and County* (2 vols., Chicago, 1912).

PEORIA. One of the five principal tribes of the Illinois Confederacy. Their home territory was in central Illinois, situated about the lake of the same name. In 1832 they and the Kaskaskia tribe removed to Kansas, whence in 1854 they again removed to the reservation in the north-eastern corner of Oklahoma, where they still reside, confederated with the remnant of the Kaskaskia, Wea, and Piankishaw, the entire body numbering only about 180. See ILLINOIS; KASKASKIA.

PEPE, pā'pā, GUGLIELMO, BARON (1783–1855). A Neapolitan soldier, born at Squillace, Calabria. While attending a military school at Naples, he took part in the Republican movement there, fought against the Bourbons, and was exiled to France. Entering Napoleon's army, he was rapidly promoted, commanded a Neapolitan brigade in the Peninsular campaign, and with the rank of general returned in 1813 to Italy. There he served under Murat and later under Ferdinand, but in 1821 he made an unsuccessful attempt to depose the King. Thereafter he lived in exile until the revolutionary outbreaks of 1848, when he returned to Italy and had charge of the defense of Venice against the besieging Austrians. He wrote: *Relations des événements politiques et militaires de Naples en 1820 et 1821* (1822); *Mémoires historiques, politiques, et militaires sur la révolution de Naples* (1823); *Mémoires du général Pepe* (3 vols., 1847); *Histoire des*

révolutions et des guerres d'Italie en 1847, 1848, et 1849 (1850).

PEPERINO, pēp'ēr-ē'nō. See GABII.

PEPI, pā'pē. The name of two kings of Egypt of the sixth dynasty.—**PEPI I**, the greatest monarch of this dynasty, reigned for some 20 years about 2500 B.C. (2590–2570, Breasted). Memorials of him are found throughout Egypt from Elephantine to Tanis as well as in various mines and quarries. An inscription carved on the rocks of the Wādi Maghāra in the peninsula of Sinai records the fact that he sent an expedition thither in the eighteenth year of his reign, and there is other evidence of his military activity. An official named Una, in an inscription found at Abydos, relates that, at the command of King Pepi, he gathered an army, chastised the Bedouins of the Sinaitic Peninsula in several expeditions, and conducted an expedition against a more distant Asiatic country, the name of which has not yet been identified. Pepi was the founder of Memphis (q.v.), which took its name from the King's pyramid Men-no-fer, erected in the vicinity. This pyramid, which is situated near the modern village of Sakkara, was opened in 1881, and its inner walls were found to be covered with religious texts. The successor of Pepi I was his son, Mer-en-rē, and he, dying after a brief reign of four years, was succeeded by his brother **PEPI II**, of whose reign little is known. Breasted gives his dates as 2566–2476 B.C. and adds that it is the longest reign in history. According to the Turin papyrus, he reigned 90 years, while Manetho, who calls him Phiope, states that he reigned for 100 years. His pyramid at Sakkara was opened in 1881; it contains religious texts similar to those found in the other pyramids of this dynasty. Consult: W. M. Flinders Petrie, *A History of Egypt* (3d ed., New York, 1897); E. A. T. Wallis Budge, *A History of Egypt* (ib., 1902); J. H. Breasted, *Ancient Records of Egypt* (Chicago, 1906); id., *A History of the Ancient Egyptians* (New York, 1908).

PEPIN, or **PIPPIN**. The name of three Frankish mayors of the palace, ancestors of the Carolingian kings.—**PEPIN THE ELDER** (died 639), also known as **PEPIN OF LANDEN**, was the first of the name to become prominent. He was major domus of King Dagobert I of the Franks, and, together with his friend Arnulf, Bishop of Metz, controlled the policy of the state. The son of Arnulf was Ansegis, and he married Begga, the daughter of Pepin. Their son was **PEPIN OF HERISTAL** (died 714), who became major domus in the eastern part of the Frankish realm, known as Austrasia, about 679. For several years he waged an unsuccessful war against Ebroin, major domus of Neustria or West Frankland, until in 687 he won a decisive victory at Testry, which gave predominance to Austrasia, the Germanic part of the Frankish country, over Neustria, which on the whole was Celtic. Pepin became the ruler over all the Franks, completely overshadowing the various kings. His natural son was the famous Charles Martel (q.v.).—**PEPIN THE SHORT** (714–768) was King of the Franks from 751 to 768. He was the second son of Charles Martel and hence a grandson of Pepin of Heristal. In 741 he and his brother Carloman received the office of mayors of the palace. In 743 they found it necessary to place a Merovingian, Childeric III, upon the throne which their father had left vacant. For several years

the two brothers ruled conjointly, but in 747 Carloman abdicated and became a monk and later went to Monte Cassino. In 751, supported by the Pope, Pepin was crowned King, thus becoming the first King of the Carolingian dynasty. Childeric was compelled to enter a monastery. In 754 Pepin was made patrician of Rome. Soon after this time he made an expedition into Italy against the Lombards, whom he conquered. The portion of the Exarchate of Ravenna which the latter had seized Pepin gave to the Pope. (See AISTULF.) In the following year he made another expedition against the Lombards, whom he subdued thoroughly, and renewed his gift to the papacy. This is sometimes called the Donation of Pepin (q.v.). Besides overcoming the Lombards, Pepin conquered Aquitaine, took some cities from the Saracens, added Bavaria to his Empire, and began the wars against the Saxons which his son Charles was to wage successfully. Pepin was closely associated with the great missionary Boniface (q.v.) and did much to strengthen the relations between the papacy and the Franks. He died Sept. 24, 768, and was succeeded by his sons Carloman and Charles the Great (q.v.).

Bonnell, *Die Anfänge des karolingischen Hauses* (ib., 1866); Ludwig Oelsner, *Jahrbucher des frankischen Reichs unter König Pepin* (Leipzig, 1871); George Waitz, *Deutsche Verfassungsgeschichte*, vols. ii, iii (Berlin, 1882-83); Engelbert Mühlbacher, *Deutsche Geschichte unter den Karolingern* (Stuttgart, 1896); Thomas Hodgkin, *Italy and her Invaders*, vol. vii (Oxford, 1899); *Cambridge Medieval History*, vol. ii (New York, 1913).

PEPIN, DONATION OF. See DONATION OF PEPIN.

PEPIN, LAKE. An expansion of the Mississippi River, 30 miles below St. Paul (Map: Wisconsin, A 4). It is about 30 miles long, and about 1 to 2 miles wide. The town of Red Wing lies at its north end. The lake is the result of the deposit in the bed of the Mississippi of fluvioglacial drift by the Chippewa River at what is now the lake's lower end. It is surrounded by bluffs of limestone, rising about 400 feet, weatherbeaten into fantastic shapes.

PEPITA JIMÉNEZ, pà-pé'tà hè-mā'náth. A romance by Juan Valera (1874).

PEPO. The ripe seed of a pumpkin, *Cucurbita pepo*, used in medicine as a vermifuge. Its active properties are due to a resin, which may be given in doses of 15 grains; or the pulp of the seeds, rubbed into an emulsion with water after the husks have been removed, may be administered. The drug is a nonpoisonous and efficient anthelmintic.

PEPOLI, pà'pò-lé, GIOACCHINO NAPOLEONE, MARQUIS (1825-81). An Italian statesman, grandson of Murat. He was born at Bologna and married at 19 his cousin, Friederike of Hohenzollern-Sigmaringen. In 1848 he led the National Guards with success against the Austrian troops, and when his native city was taken by the Austrians he fled to Tuscany. In 1859, seven years after his return, he was put at the head of the provisional government of Bologna. After the annexation of the Romagna he entered the Italian Parliament as a member of the Left Centre, was Secretary of Agriculture (1862), and Ambassador to St. Petersburg (1863-64) and to Vienna (1868-70). His close relations

with the Hohenzollerns and Bonapartes were influential in securing recognition and assistance for the Italian kingdom. From 1868 to his death Pepoli was a Senator.

PEPPER (AS. *pipor*, *piper*, from Lat. *piper*, from Gk. *πῖπερ*, *piperi*, *πῖπερ*, *peperi*, pepper, from Skt. *pippala*, long pepper), *Piper*. A genus of plants of the family Piperaceæ (q.v.), with woody stems, solitary spikes opposite to the leaves, and covered with flowers on all sides, the flowers mostly hermaphrodite. The most important species is common pepper or black pepper (*Piper nigrum*), which is a native of the East Indies, cultivated also in many tropical countries and extensively in some parts of the New World, its fruit being the most common and largely used of all spices. It is a rambling and climbing shrub, with smooth and spongy stems, 12 to 20 feet in length, and broadly ovate, acuminate, leathery leaves. The fruit is about the size of a pea, of a bright-red color when ripe, not crowded on the spike. In cultivation the pepper plant is supported by poles or by small trees planted for the purpose. It is propagated by cuttings, comes into bearing in three or four years after it is planted, and yields two crops annually for about 12 years. When any of the berries of a spike begin to change from green to red, all are gathered, as when more fully ripe they are less pungent, besides being apt to drop off. Pepper was known to the ancients; Hippocrates used it as a medicine. In the Middle Ages pepper was one of the most costly spices, and in the thirteenth century a few pounds of it were reckoned a princely present. The black pepper of commerce consists of the dried berries. White pepper is the seed freed from the skin and fleshy part of the fruit, to effect which the dried fruit is soaked in water and then rubbed. Pepper depends for its properties chiefly on an acrid resin and an acrid volatile oil; it contains also a crystalline substance called piperin. The fruit of *Piper tricoicum*, a species very similar to the common pepper, is more pungent and is cultivated in some parts of India. Red pepper is chiefly obtained from species of *Capsicum* (q.v.), especially *Capsicum annuum* and *Capsicum frutescens*, varieties of which are grown in gardens in temperate climates. The larger-fruited sorts, green or ripe, furnish peppers for pickling; while the smaller sorts are used in making chili, capsicum, or cayenne sauce for meats, etc. The culture of red peppers is about the same as for eggplant (q.v.). See FLAVORING PLANTS.

Pepper is used medicinally as an aromatic and a carminative. When applied to the skin it acts as an irritant. Taken internally, it increases slightly the action of the heart and kidneys, and has been thought to possess anti-periodic properties, being formerly given in intermittent fever. Its chief medicinal use is to correct flatulence and prevent intestinal fermentation, and it is therefore a valuable condiment.

Jamaica pepper (or pimento) is a species of *Pimenta*, of the family Myrtaceæ. Guinea pepper and Meleguetta pepper are species of the families Anonaceæ and Zingiberaceæ respectively. See ALLSPICE; ANTHRACNOSE; CAPSICUM; GRAINS OF PARADISE; GUINEA PEPPER.

PEPPER, GEORGE DANA BOARDMAN (1833-1913). An American theologian and educator, born at Ware, Mass. He was graduated from Amherst College in 1857 and in 1860 from New-

ton Theological Institution, where, after five years as a Baptist minister at Waterville, Me., he served as professor of ecclesiastical history until 1867. Subsequently he was professor of systematic theology at Crozer Theological Seminary (1868-82) and in 1882-89 was president of Colby University (now Colby College), where he remained as professor of biblical literature until 1900.

PEPPER, GEORGE WHARTON (1867-). An American lawyer, born in Philadelphia. He was educated at the University of Pennsylvania (A.B., 1887; LL.B., 1889), where he was Algeron Sydney Biddle professor of law from 1893 to 1910, at the same time practicing law. Pepper upheld the university trustees in dismissing Scott Nearing (q.v.). He is author of *The Borderland of Federal and State Decisions* (1889); *Pleading at Common Law and under the Codes* (1891); *The Way* (1909); *A Voice from the Crowd* (1915), Lyman Beecher lectures at Yale; and coauthor of *Pepper and Lewis' New Digest* (1895; 2d ed., 1910).

PEPPER, WILLIAM (1843-98). An American physician and educator, the son of William Pepper. Born and educated in Philadelphia (University of Pennsylvania, M.D., 1864), he settled there and became connected with several hospitals. Although he had a large practice he took much interest in his alma mater, whose faculty he joined in 1868 as lecturer on morbid anatomy. From 1870 to 1876 he was professor of clinical medicine, in the latter year succeeding Alfred Stillé as professor of theory and practice of medicine. This chair he held until 1881, when he was unanimously elected provost of the university. As such he greatly improved the facilities of the university and especially of the medical department. Pepper resigned in 1894. He served as president of the Association of American Physicians in 1891. In 1870 he founded the *Philadelphia Medical Times* (now incorporated in the *New York Medical Journal*), whose editor he was during its first year. He edited the first large American medical system, *Textbook of Theory and Practice of Medicine by American Teachers* (5 vols., 1886-93), and a revised edition of J. F. Meigs's *A Practical Treatise on the Diseases of Children*. Pepper contributed valuable papers to medical literature, afterward reprinted. Among his books may also be mentioned: *Sanitary Relations of Hospitals* (1874); *Higher Medical Education* (1877, 1894); *Syllabus of Notes . . . on the Theory and Practice of Medicine* (1886). Consult F. N. Thorpe, *William Pepper: Biography* (Philadelphia, 1904).

PEPPERBRAND. A disease of cereals. See BUNT.

PEPPERCORN. A disease of wheat. See EARCOCKLES.

PEPPERELL. A town in Middlesex Co., Mass., 35 miles northwest of Boston, on the Nashua River and on the Boston and Maine Railroad (Map: Massachusetts, D 2). It contains the Lawrence Library and the Wolcott Monument. The manufacture of card and paper constitutes the chief industry. Pepperell owns its water works. Pop., 1900, 3701; 1910, 2953.

PEPPER FAMILY. A family of plants. See PIPERACEÆ, and Plate of FLAVORING PLANTS.

PEPPERGRASS (*Lepidium sativum*). A name synonymous with garden cress. See CRESS.

PEPPERIDGE. A North American tree. See BLACK GUM.

PEPPERMINT. A perennial herb. See MINT.

PEPPERRELL, SIR WILLIAM (1696-1759). An American Colonial soldier, born at Kittery, Me. In 1726 he was elected a Representative to the Massachusetts General Court, was next year made a member of the Council, and in 1730, although he had not been educated for the legal profession, he received the appointment of Chief Justice of the Court of Common Pleas. On the breaking out of King George's War (q.v.) he enthusiastically favored the attempt of the New England Colonies to capture the French stronghold of Louisburg on Cape Breton Island and lent £5000 towards equipping the expedition. As a result of his activity and influence he was made commander in chief. Aided by an English squadron under Commodore Warren, he landed his army, numbering about 4000 men, and began the siege of the fortress on the last day of April, 1745. On the seventeenth of the following June the place capitulated. Pepperrell was in 1746 created Baronet by King George II, and while he was on a visit to England in 1749 the city of London presented him with a silver service. When the French and Indian War began (1755), he was active in raising troops, was commissioned a major general in the English army, and commanded the forces defending the frontiers of New England. From 1756 to 1758 he was acting Governor of Massachusetts and in February, 1759, was promoted to the rank of lieutenant general, but died at Kittery in the following July. Pepperrell kept a journal during the Louisburg expedition, and this was edited by C. H. Lincoln and published in the *Proceedings of the American Antiquarian Society* (Worcester, Mass., 1910). He published an account of the *Conference with the Penobscot Tribe* (Boston, 1753). Consult Usher Parsons, *Life of Sir William Pepperrell* (ib., 1855), and Francis Parkman, *A Half-Century of Conflict* (ib., 1892).

PEPPERROOT (*Dentaria diphylla*). A North American perennial herb, of the family Cruciferae, with pairs of ternate leaves, racemes of white flowers, and pungent mustard-flavored roots, used as a condiment.

PEPPER TREE (so called from the pungent drupes), or PEA TREE (*Schinus*). A genus of South American and Mexican trees and shrubs of the family Anacardiaceae. The leaves abound in a resinous or turpentine-like fluid, which is discharged when the leaves become turgid. After rain they fill the air with fragrance, and if thrown into water they jump about as if alive, discharging jets of this peculiar fluid. The twigs also have a strong odor of turpentine. One species, *Schinus molle*, a rapidly growing tree, which attains a considerable size, has been introduced extensively into California. See Plate of POPPY and PEPPER TREE.

PEP'SIN (Fr. *pepsine*, from Gk. *πέψις*, *pepsis*, a cooking, from *πέπρω*, *peptein*, to cook; connected with Lat. *coquere*, Skt. *pac*, to cook). A proteolytic enzyme, an active ferment present in the gastric juice, which has the property of converting the proteid elements of the food into peptones. Pepsin requires for its action the presence of an acid and moderate warmth. As used in medicine it occurs in a fine yellowish-white amorphous powder or in translucent grains or scales. It is extracted from the glandular layer of the stomachs of freshly killed pigs or from the rennet bags of sheep, and should be capable of digesting not less than 3000 times its

own weight of egg albumen. It has, however, been isolated in such a pure form as to be able to digest 25,000 times its own weight of albumen. The use to which it is put is to aid gastric digestion in very old or feeble persons where the gastric juice is deficient. The enzyme does not act on carbohydrates or fats, and is therefore perhaps inferior for general use to pancreatin (q.v.). Pepsin is also used to predigest albuminous foods in the case of invalids with impaired digestive power. Milk is especially valuable when thus modified. See DIGESTION.

PEPTONES. See PROTEINS.

PEPYS, péps, péps, or pép'is, CHARLES CHRISTOPHER, first EARL OF COTTENHAM (1781-1851). An English jurist, born in London. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar in 1804. In 1830 he was appointed Solicitor-General and in the following year was elected to Parliament. In 1836 he was made Baron Cottenham and Lord Chancellor under the Melbourne administration, and resumed the same post in Lord John Russell's first government. In 1850 he was created Viscount Crowhurst and Earl of Cottenham.

PEPYS, SAMUEL (1633-1703). An English administrator and diarist. He was born Feb. 23, 1633, the son of a London citizen, a tailor, but was in some respects well educated, first at St. Paul's School and afterward at Magdalene College, Cambridge. His cousin, Sir Edward Montagu (later Earl of Sandwich, q.v.), to whom he was for a time secretary, introduced him to public employment. In 1660 he was appointed clerk of the acts of the navy and in 1673 "secretary for the affairs of the navy." He was an excellent public servant, acute, diligent, and laborious; but during the fanatical excitement of the Popish Plot (see OATES, TITUS) he was committed to the Tower on an unfounded charge of aiding in the design to assassinate the King and to extirpate the Protestant religion. Having been discharged without a trial, Pepys was restored to his post in the Admiralty, which he retained till the revolution of 1688. He subsequently suffered a short imprisonment on the charge of being a Jacobite (1689-90). For two years (1684-86) he held the honorable station of president of the Royal Society. He died May 26, 1703. Pepys wrote *Memoirs of the Royal Navy* (1690) and has been credited with *The Portugal History, 1667-68*, by S. P. Esq. (1677). He left to Magdalene College his large collection of books, manuscripts, and prints, including about 2000 ancient English ballads, forming five folio volumes. This curious collection was begun, he says, by Selden, and was continued down to the year 1700, when the form peculiar to the old ballads, viz., the black letter with pictures, was laid aside for the simpler modern fashion. Pepys is now remembered chiefly for his *Diary*, deciphered by the Rev. J. Smith from the original shorthand manuscript in the Pepysian Library, Cambridge, and first published in a mutilated form under the editorial care of Lord Braybrooke in 1825. It begins Jan. 1, 1660, and is continued for about nine years, when the diarist was obliged from defective eyesight to abandon his daily task. As a picture of the court and times of Charles II this *Diary* is invaluable: the events, characters, follies, vices, and peculiarities of the age are presented in true and lively colors. But its perennial appeal will be as a revelation of the character of the author—capa-

ble public man, lover of society, domestic in his tastes, though not consistently so, vain as a peacock, overproud of his accomplishments, anxious for the favor of the great, pleased with every new pleasure, a man of the world, a snob, a child, and lovable withal. The *Diary*, racy yet quaintly naive, is, all in all, one of the most diverting books in the language. Although it seems incredible that Pepys could have desired so candid a self-portrait to be exhibited to the whole world, yet perhaps he was too genuinely the egoist to dread publicity (especially posthumous), even of his foibles, his faults, and his sins. It has often been printed, but all the editions are fragmentary except that by Wheatley in eight volumes (London, 1893 et seq.), which is accurate and complete except for the omission of a few of the most offensive passages. Wheatley added to his edition a volume of *Pepysiana* (1899). The same editor has also published *Samuel Pepys and the World he Lived in* (London, 1880). Some hitherto unpublished letters of Pepys are to be found in the *Athenæum*, vol. xc (ib., 1887), and the *Academy*, vol. xxxviii (ib., 1890). Consult also: Tanner, "Pepys and the Popish Plot," in the *English Historical Review*, vol. vii (ib., 1892); R. L. Stevenson, "Samuel Pepys," in *Familiar Studies* (ib., 1892); Percy Lubbock, *Samuel Pepys* (ib., 1909); E. H. Moorhouse, *Samuel Pepys, Administrator, Observer, Gossip* (ib., 1909).

PEQUOT (from *Paquatanog*, destroyers). A warlike Algonquian tribe formerly occupying the coast region of eastern Connecticut from the Rhode Island border westward to beyond the Thames. They were originally a part of the Mohegan (q.v.) of the Connecticut River, and appear to have acquired their later name by their successful invasion of the coast country until then held by the Niantic (q.v.). The two tribes continued to be one people until the succession of Sassacus about the time of the English settlement, when a younger chief, Uncas, seceded with his party, who thenceforth acted as a distinct tribe, retaining the old name of Mohegan. At the period of their greatest strength the Pequot probably numbered at least 3000. By the murder in July, 1636, of a trader, John Oldham, who had maltreated them, the Pequot became involved in a war with the English in 1637. On May 26 (O. S.), 1637, their principal fort, near Mystic River, was surprised and set on fire by a company of about 90 whites, under Capt. John Mason (q.v.), aided by a small force of Indians, and probably 600 Pequot men, women, and children perished in the flames or were shot down while trying to escape. The loss of the English was only two. The tribe was so crippled by the terrible slaughter that after a few desperate but unsuccessful efforts at resistance they determined to separate into small parties and abandon their country. The principal body, headed by Sassacus, attempted to escape to the Mohawk, but was intercepted and nearly every person was either killed or captured. The few who escaped to the Mohawk, including Sassacus himself, were killed by that tribe. Scattered fugitives were shot down wherever found until the few survivors at last came in and asked for mercy at the hands of the English. All prisoners taken had been sold into slavery, many to the West Indies, and those who now surrendered were distributed among the other neighboring tribes and forbidden any longer to call themselves Pequot. The Pequot

given to the Indian allies of the colonists were treated so harshly by their masters that it was finally necessary in 1655 to gather them into two villages in their old country and place them under direct control of the Colonial government. Here they numbered about 1500 in 1674. They decreased rapidly, as did the other tribes, and in 1762 the remnant numbered only 140, who in 1832 had dwindled to 40, but in 1910 they numbered 66.

PERA, pā'rá. The foreigners' quarter in Constantinople (q.v.).

PERACAMPOS, pā'rá-kām'pós, DON JUAN VAN HALEN, COUNT OF. See HALEN, or HALEM.

PERÆ'A (Lat., from Gk. Περαια, *Peraia*, from περαιος, *peraios*, beyond, from πέρας, *peran*, on the other side). A part of Palestine, east of the river Jordan, anciently belonging to the tribes of Reuben and Gad (Map: Palestine, D 4). Josephus (*Bel. Jud.*, iii, 3, 3) bounds it on the north by Pella, east by Philadelphia, south by the castle of Machærus, and west by the Jordan. Elsewhere (*ib.*, iv, 7, 3 and 6) he names Gadara as the capital. It is probable, however, that Peræa extended as far north as the Yarmuk and south to the Arnon. The district is a high table-land, cut up by deep watercourses. It is naturally a fertile region, provides good pasturage, and the olive and the vine flourish there. In the earlier days of the Maccabees it was inhabited chiefly by Gentiles, but by the beginning of the Christian era the population had become prevaillingly Jewish, and Peræa sent a multitude of Jews to Jerusalem in the uprising against Sabinus. Peræa was the scene of a part of the ministries of John the Baptist and of Jesus, who, according to John x. 40, appears to have been baptized there, and from Peræa he made his last journey to Jerusalem. See BASHAN; GILEAD; PALESTINE.

PERAK, pā-rik'. The most northerly of the Federated Malay States (q.v.), situated on the western coast of the Malay Peninsula, bounded by Kedah and Patani on the north, Kelantan and Pahang on the east, Selangor on the south, and the Strait of Malacca on the west (Map: Burma, Siam, etc., D 6). It also touches Province Wellesley and the Dindings Territory. Its area is estimated at about 7800 square miles. The region is traversed from northeast to southwest by two parallel mountain ranges inclosing the valley of the Perak River. The mountains are highly mineralized. Those on the Pahang boundary, which are part of the main range of the peninsula, reach a height of over 7000 feet, the highest being Gunong Kerbau, 7160 feet. There are a number of rivers besides the Perak and its tributaries, but they are mostly unimportant for navigation. The climate is characterized by intense humidity and is unhealthful for Europeans. The chief mineral is tin, which is mined principally in the districts of Kinta, Larut, Badang Padang, and Klian Intan. Employees in the tin mines are mostly Chinese. Besides tin Perak has also deposits of gold, silver, iron, lead, copper, arsenic, zinc, manganese, bismuth, etc. Agriculture plays only a secondary part, and a large portion of the region is still covered with forests. The agricultural population is chiefly Malay. Important agricultural products are rice, sugar, coconuts, and rubber. Perak has greatly increased in commercial importance since the establishment of the British protectorate. Imports and exports were valued at 14,741,148 and 29,190,-

663 Straits Settlements dollars, respectively, in 1900; in 1905, 20,153,242 and 41,187,506; in 1910, 21,784,361 and 44,084,758; in 1913, 34,286,777 and 71,402,985. (See FOREIGN MONEY.) Tin ore and, especially in recent years, rubber are by far the largest exports. The exports of tin ore and tin amounted to 35,501,981 dollars in 1905, 32,686,972 in 1910, and 49,082,938 in 1913. The rubber export increased in value from 126,812 dollars in 1905 to 7,757,432 in 1910 and 18,326,505 in 1913. The only other large exports in 1913 were: copra, 1,417,118 dollars; rice, 1,018,279; paddy, 538,341. The sugar export declined from 2,181,974 dollars in 1905 to 674,197 in 1910 and 6511 in 1913. Southeast from the Province Wellesley boundary the state is traversed by the main line of the railway that connects Prai (opposite Penang) and Johore Bharu (opposite Singapore). Revenue and expenditure in 1910, 14,229,789 and 12,060,565 dollars respectively; in 1913, 23,970,058 and 25,804,040. The population of the state in 1901 was 329,665, including about 150,000 Chinese, 142,000 Malays, 35,000 Tamils, etc., 8000 aboriginals, and 700 whites. The 1911 census returned a population of 494,057, of whom 344,238 were males and 149,819 females; estimate of Dec. 31, 1913, 531,037. The chief towns are Ipoh, Taiping, Kuala Kangsar, Tapah, and Kampar; the chief port is Teluk Anson. Taiping is the capital. The first European settlement in Perak was established in 1650 by the Dutch, who were expelled by the British in 1795. In 1818 Perak fell under the rule of the Siamese, but it regained its independence with the assistance of the British in 1824, and was governed by its own sultans until 1874, when internal dissensions brought about British interference and the appointment of a British resident, who was soon murdered. British authority was reestablished by means of a punitive expedition, and no further manifestation of resistance to British protection has occurred. The discovery of tin about 1850 was followed by the immigration of Chinese in great numbers. The Anglo-Siamese Treaty of 1909 transferred from Patani to Perak about 1000 square miles of territory (population at that time about 3000). This territory, lying east of Kedah, contains the tin mines of Klian Intan. See FEDERATED MALAY STATES. Consult McNair, *Perak and the Malays* (London, 1878), and Wright and Reed, *The Malay Peninsula* (*ib.*, 1912).

PERAMBULATION OF PARISHES. An ancient custom conducted with much ceremony before the Reformation in England. It took place on one of the Rogation Days (q.v.). The clergy, the lord of the manor, and many other persons walked in procession all around the boundaries of the parishes, returning to the church for prayer. The ceremonies were much curtailed at the Reformation, but the custom continued and, on the plea of immemorial custom, has often afforded evidence in cases of disputed boundary. The origin of the custom has been referred to the Roman festivals of Terminalia and Ambarvalia. For the customs, consult Chambers, *The Book of Days*, under May 2 (London, 2d ed., 1906).

PER CAPITA (Lat., according to heads or individuals). A term derived from the civil or Roman law, employed in the law of succession to denote that the persons upon whom property devolves by inheritance or devise are entitled

to take equal individual shares in their own right and not as a group representing a parent or other ancestor. In most jurisdictions descendants in an equal degree of relationship to a common ancestor take per capita, i.e., each has an equal right, the estate being divided among them in equal shares. Thus, if a person dies leaving children or, there being no children, leaving several brothers and sisters, the children in the one case, the brothers and sisters in the other case, inherit equal shares in the decedent's estate, i.e., they take as independent individuals—per capita. But if one dies leaving a son and several grandchildren, the issue of another (deceased) child, the grandchildren take as a group only their parents' share. In that case they are said to take per stirpes (Lat., according to stocks), i.e., as a group representing their deceased parent. The manner of succession and descent is largely regulated by statute in the various States. See DESCENT; DISTRIBUTION; SUCCESSION.

PERCEFORÊT, pâr's'fô'râ' (Fr., pierce-forest). A French romance giving the fabled history of Britain before the days of King Arthur and first printed in Paris in 1528. The time of its production is uncertain, but was probably the latter part of the thirteenth century. The writer hints that the romance was taken from a manuscript found in an English monastery in 1286. The hero, King Perceforêt, so called from his conquest of an enchanted forest, came to Britain with Alexander the Great, after the royal line of Brut was extinct, and in fulfillment of an oracle was made King. Unlike most romances of chivalry, it deals with enchantments, dreams, and visions rather than with battles and tournaments. In its day it was the most popular romance of its class, and is now valuable for its descriptions of mediæval life and manners.

PERCEPTION. Essentially, a sensory experience which is meaningful and in which sensory elements are so incorporated into a group as to give the impression of a single and unitary whole. When we perceive an external object, e.g., a tree, the experience comes to us as a whole, with the meaning of "that tree." Since perception thus involves meaning (q.v.), it is a term common to both psychology and epistemology. The questions how, in general, we acquire knowledge of an external world and what is the validity of this knowledge when attained, are questions that lie beyond the psychological sphere. Within psychology perception is regarded either as a specific mode of mental function, in which case its meaningful character is emphasized, or as a complex of mental processes, in which case emphasis is laid on its pattern or arrangement.

Functional psychologists are practically agreed as to the cognitive nature of perception, though some regard it as a stage of cognitive process and others make it synonymous with cognition. They do not agree, however, whether it is capable of further analysis. Ward, e.g., regards the percept or intuition as an integration or synthesis of approximately elementary presentations, while James thinks of it as something quite single and unitary. Stout occupies an intermediate position; perceptions, he thinks, are single and unitary, but "the distinctionless unity of the whole tends to pass into multiplicity as the mind dwells on it."

The problem of perception, taken structurally,

is (1) to resolve the complex into its elements; (2) to single out those elements which form, as it were, the nucleus of the perception from those which furnish the context, the vehicle of its meaning; (3) to describe the pattern or mode in which the various elements are incorporated into the group; and (4) to discover the physiological conditions which underlie the particular grouping. The problem thus outlined is difficult, principally because our perceptive patterns are very old, far older indeed than man himself. We are born with dispositions to take the world perceptively, to see objects as far or near, here or there, stationary or moving. We may hardly hope to discover what the perceptive patterns were in their original form; for mental processes which once were present have dropped out and nervous sets or brain habits have taken their place. How far psychology has succeeded in its attack upon the problem can best be learned from a study of separate perceptions. (See DISTANCE OR DEPTH; LOCALITY; MOVEMENT; RHYTHM; ETC.) In general we may say that every perception may be resolved into the two factors suggested above, the one peripheral or sensory, the other central or nervous. The latter includes not only imaginal processes (see IMAGE), which may in fact be traced in many though not in all perceptions, but also nervous predispositions or brain habits. (See DISPOSITION.) The peripheral factor, together with the imaginal contents, furnishes the elements of which the perception is composed. The brain habit determines the pattern of the grouping, the mold, as it were, into which the elements are run. In qualitative perceptions, such as that of lemonade, which resolves into sweet, sour, cold, pressure, an odor, etc., the peripheral is the more important factor; the various qualities so blend or merge into one another as to give the impression of a single whole without losing their qualitative individuality. Brain habits, on the other hand, seem to be essential in spatial perceptions. The sensory elements are here conjoined rather than blended, and they serve mainly as clues for touching off the disposition to regard the object as spatial. For illustration of the effect of brain habit in visual perceptions of space, see ILLUSION.

Some psychologists believe that, in the synthesis of the component parts of a perception, a new and unique quality appears as a result of the form of combination. A melody, they urge, is something more than a succession of tones which vary in pitch relation, duration, and intensity; it is melodic; and melodiousness is a new element, a form quality; no description of a perception is complete which leaves it out of account. The new element, however, is not required. It is a matter of experience that a perception is something more than a mere sum or collection of sensations and images; the pattern or mode of incorporation is also essential. Every type of perception, therefore, has its singularity, something formal which may be regarded as a mark or characteristic of that type. In so far we may admit the existence of form quality; but that is not to say that we have found a new mental element; for then the form quality would remain over, would be left on our hands, after our analysis of perception had been otherwise completed, and this is not the case. The facts are met if we remember that the constituent processes in perception

are cast in a genetic mold which shapes or arranges them in some typical way.

PERCEPTION OF SPACE. See VISION.

PERCEVAL, pĕr'si-val. The hero of one of the most famous and widespread legends in the Arthurian cycle. Speaking with the uncertainty which always attaches to any attempt to determine positively the history of these legends, it may be held that the version of the Grail story in which Perceval is the hero is earlier than that in which Galahad holds this place. Those scholars who maintain the theory of a Welsh origin for the whole cycle attempt with determination to identify Perceval with the Peredur of the *Mabinogion* and other Welsh legends; but it is only by straining a possible allusion that any reference to the Grail can be found in them. This feature becomes of prime importance in the romance of *Perceval le Gallois*, begun by Chrestien de Troyes (q.v.), continued by Gauchier de Denain, and finished by Menneceier and Gerbert in the closing years of the twelfth century. This French version was taken by the great German poet Wolfram von Eschenbach and adapted rather than translated. In his *Parzival*, the work of his highest genius, rendered additionally famous from its selection by Wagner as the basis of a libretto, we get farther away from the Arthurian legend proper into regions of Germanic mysticism. Yet, though there are defects of dramatic structure in Wolfram's treatment as a whole, and though we find ourselves in a strange country and the Grail mountain, Montsalvatsch, is altogether in fairyland, there is in him something higher and larger and more human than in the Western versions. For the Welsh theory, consult Sir John Rhys, *Studies in the Arthurian Legend* (Oxford, 1891); for Chrestien's romance, the edition by Foerster, *Percevals li galois* (Freiburg, 1909); for Wolfram von Eschenbach, Wilhelm Hertz, *Parzival* (Stuttgart, 1898), which contains good notes and a rich bibliography, and a rendering in English verse by J. L. Weston (London, 1894). Other aspects of the subject are treated in Hoffmann, *Die Quellen des Didot Perceval* (Halle, 1905); R. H. Griffith, *Sir Perceval of Galles: A Study of the Sources of the Legend* (Chicago, 1911); Campion and Holthausen, *Sir Perceval of Gales* (Heidelberg, 1913); Ward and Waller, in *The Cambridge History of English Literature*, vol. i (New York, 1907). See GRAIL; and, for the Wagner treatment, PARSIFAL.

PERCEVAL, SPENCER (1762-1812). An English statesman, born in London, Nov. 1, 1762. He was the second son of John, Earl of Egmont,

was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln's Inn in 1786. A clever pamphlet on the abatement of the impeachment of Warren Hastings made him favorably known to Pitt. Obtaining a seat in Parliament for Northampton in 1796, he supported Pitt in his policy of war with France and of a strong rule at home. In the Addington administration he was made Solicitor-General in 1801 and Attorney-General in 1802. In 1807 he abandoned the legal profession to accept the post of Chancellor of the Exchequer under Portland. In this position he conceived and drafted the Orders in Council, which became extremely unpopular. His well-known opposition to Catholic emancipation assured him the favor of George III. He was in fact the real head of the government, and on the death of the Duke of Portland in 1809 Perceval himself became Prime Minister, uniting to his office of Chancellor of the Exchequer that of First Lord of the Treasury. He was retained in power by the Prince of Wales on his accession to the regency. On May, 1812, as Perceval was entering the lobby of the House of Commons, he was shot and killed by a Liverpool broker named Bellingham, who believed that losses he had sustained while in Russia were the fault of the government. Consult: C. V. Williams, *Life and Administration of the Right Honorable Spencer Perceval* (London, 1856); Sir Spencer Walpole, *Life of Spencer Perceval*, including his correspondence (ib., 1874); Philip Treherne, . . . *Spencer Perceval* (ib., 1909).

PERCH (OF., Fr. *perche*, from Lat. *perca*, from Gk. *πέρκη*, *perkē*, perch; connected with *περκνός*, *perknos*, Skt. *prñi*, spotted). The name rather loosely applied to a large number of fishes having a perciform body. These often belong to very different families. The true perches belong to the family Percidae and are all fresh-water fishes. In this family the body is elongated, either compressed or cylindrical, and covered with rather small ctenoid scales. There are two dorsals, usually quite distinct, the anterior spinous, and with 6 to 15 spines, and the anal with 1 or 2 spines. The air bladder is small or entirely wanting. Perches are usually considered typical spiny-rayed fishes. There are about 20 genera and 125 species. They are distributed in the cooler regions of the Northern Hemisphere, the majority of the species being confined to eastern North America. The typical perches (genus *Perca*) contain the well-known yellow perches of Europe, Asia, and America, which closely resemble one another. The American species (*Perca flavescens*) is a fish well known to all anglers, abounding in the lakes and streams of all the eastern half of the country, as far north as the St. Lawrence River and Nova Scotia. It reaches the length of 1 foot, is gamy, and admirable for eating. Its back is olivaceous in color, the sides golden yellow, with six or eight broad dark bars, and the lower fins orange red. It spawns in late winter and early spring, laying eggs in zigzag hollow strings from 2 to 7 feet long. These fish are carnivorous and feed largely on smaller fishes, including the fry of some more valuable than themselves. They are extremely numerous in the Great Lakes, where they are caught near shore in seines and gill nets in vast quantities and shipped to interior markets to the value of about \$300,000 annually. Other local names are

PERCHES OF NORTH AMERICA

1

2

3

4

5

6

1. LOG PERCH (*Percina caprodes*).
2. SACRAMENTO PERCH (*Archoplites interruptus*).
3. YELLOW PERCH (*Perca flavescens*).

4. SAUGER (*Stizostedion Canadense*).
5. WARMOUTH (*Channobryttus gulosus*).
6. WALL-EYED PIKE (*Stizostedion vitreum*).

ringed and raccoon perch. Other members of this family are the great tribe (subfamily Etheostominae) of darters, the pike perches, and log perches (q.v.).

Various other unrelated fishes are styled perches. Thus the salt-water perches of California are surf fishes (q.v.); the Sacramento perch (q.v.) is a rock bass; the white perch may be a drumfish in the East or a surf fish in the West; the blue perch and sea perch are cunners (q.v.). See also PIKE PERCH; PIRATE PERCH; TROUT PERCH. Consult: G. B. Goode, *American Fishes* (New York, 1888); Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898); D. S. Jordan, *Guide to the Study of Fishes* (New York, 1900). See Plate of PERCHES OF NORTH AMERICA.

PERCHERON (për'she-rôn or pèr'chè-rôn) **HORSE**, THE. A valuable breed of draft horse. It is a native of the Department of Perche, in the northwestern part of France. The Percheron originated from stock typical of the heavy-draft type which existed throughout a large part of northern Europe. Crosses were made with the Arab horse, which improved the type in style, bone, and finish as we see it in the modern Percheron. The Percheron of 50 years ago was about 15 or 16 hands high and gray in color, though there were some blacks. To-day the Percheron is somewhat larger, being 15 to 17 hands high and weighing 1500 to 2000 pounds. The head is handsome, the body compact and blocky, and the limbs clean and free from coarse hair. Though gray and black are the prevailing colors, there are some browns and bays. Large numbers of Percherons have been imported to the United States, where it is one of the most popular of heavy-draft breeds.

PERCHLORIC ACID, HClO_4 . A colorless corrosive liquid that may be prepared by distilling potassium chlorate with sulphuric acid and cautiously redistilling the distillate. When brought into contact with organic substances, such as paper or wood, perchloric acid causes almost explosive combustion. It is a monobasic acid that combines readily with bases to form a series of salts called perchlorates. Perchloric acid and the perchlorates are very stable. The acid is the only one of chlorine acids containing oxygen that can be distilled, although partial decomposition does take place. Potassium perchlorate (KClO_4) is formed when potassium chlorate is heated (as in preparing oxygen). Further heating decomposes the perchlorate into potassium chloride and free oxygen. On the other hand, when potassium perchlorate is heated alone, it decomposes with the formation first of the chlorate and chloride of potassium and of free oxygen.

PERCHTA. See BERCHTA.

PERCIER, pār'syâ', CHARLES (1764-1838). A French architect and designer, born in Paris. With Pierre Fontaine (q.v.), his friend and afterward his partner, he was a pupil in the atelier of Peyre; he also studied under Chalgrin and De Gisors. He won the Grand Prix de Rome in 1786. After his return to Paris he designed furniture and scenery for the Opéra, all in the antique style. He did for furniture what David was doing in painting, and, conjointly with Fontaine, may be said to have introduced the classic revival of the Empire. Their first important commission was the remodeling of Malmaison; they were then appointed architects for the Opéra (1794) and of

the Louvre and the Tuileries (1802). They restored the Colonnade built by Claude Perrault (q.v.), and finished the upper story of the buildings on the court in the Louvre; built the chapel, theatre, and other portions of the Tuileries; designed the Arc de Triomphe du Carrousel, the monument to Desaix, the stairway of the Museum of the Louvre (removed by Napoleon III), and restorations and additions at Versailles, Saint-Cloud, and other palaces. Percier also built the tomb of the Countess of Albany at Santa Croce in Florence (1824). His work was marked by great refinement of detail and bears evidence of the influence of Piranesi (q.v.). He had given up his connection with Fontaine in 1814, thereafter working steadily in his atelier, where he conducted a school of architecture. He wrote *Restauration de la colonne Trajane* (1788) and, in collaboration with Fontaine, *Palais, maisons, et autres édifices de Rome moderne* (1802); *Recueil de décorations exécutées dans l'église Notre-Dame et au Champ-de-Mars* (1807); *Choix des plus célèbres maisons de plaisance de Rome et de ses environs* (1809-13); *Recueil des décorations intérieures* (1812).

PERCIN, pèr'sân', ALEXANDRE (1846-). A French general, born at Nancy. In the Franco-Prussian War (1870-71), during which he had been wounded, he rose to be captain. Subsequent promotions were to brigadier general in 1900 and major general in 1903. He was given the directorship of the arms factory at Saint-Etienne in 1893, and in 1908 became a member of the superior council of war. Early in the European War (1914 et seq.) he received an important command, which he lost for a reason never made public by General Joffre.

PERCIVAL, pèr'st-val, JAMES GATES (1795-1856). An American of remarkable versatility—poet, geologist, botanist, surgeon, musician, and linguist. He was born at Berlin, Conn. After graduating from Yale (1815) he followed his various callings at West Point and in Boston, Philadelphia, Charleston, S. C., Connecticut, and Wisconsin. He did good work in geology, and his poetry is generally fluent and occasionally striking. A complete edition of it, with a biographical sketch by Erastus North, was published in two volumes (Boston, 1859). Consult J. H. Ward, *The Life and Letters of James Gates Percival* (Boston, 1866).

PER'CLOSE (OF. *perclose*, *parclose*, inclosure, from ML. *perclusus*, for Lat. *præclusus*, p.p. of *præcludere*, to shut off, from *præ*, before + *cludere*, to close). A railing or other inclosure separating a tomb or chapel from the rest of a church.

PERCOIDEA, or **PERCOIDEI** (Neo-Lat., from Lat. *perca*, perch). A large group of spiny-rayed fishes, including the perches and their near relatives. It embraces the families Centrarchidæ, Percidæ, Cheilopteridæ, Centropomidæ, Serranidæ (sea bass), and others, which are regarded by some ichthyologists as standing at the head of the fish class. The characteristics of this world-wide and important group are given under the names of its various representatives elsewhere described. Consult Jordan and Evermann, *Fishes of North America* (Washington, 1896), and G. A. Boulenger, *Catalogue of the Perciform Fishes in the British Museum* (London, 1897). See PERCH; SEA BASS; ETC.

PER'COLA'TION (Lat. *percolatio*, from *per-*

colare, to strain through, filter, from *per*, through + *colare*, to filter, from *colum*, colander). A process used chiefly in pharmacy for extracting the soluble constituents of suitable substances by the gradual descent through them of a solvent liquid, usually alcohol or alcohol and water, technically known as the *menstruum*.

PERCUS/SION (Lat. *percussio*, from *percute*, to strike through, from *per*, through + *quaterre*, to strike). In medicine, the method of eliciting sounds by tapping or gently striking the surface of the body, its object being to determine by the nature of the sound the comparative density of the subjacent parts. This method of diagnosis is not of recent date, for we find it mentioned by Hippocrates. It was employed by Auenbrugger in the middle of the eighteenth century and later by Corvissart in the investigation of heart disease, and by Laënnec in diseases of the chest. But as the only way of practicing percussion was by striking the surface itself with the tips of the fingers or knuckles, technically known as direct or immediate percussion, its value was limited, and it was not until Piorry introduced the mediate method—the stroke being made not upon the surface itself, but upon some intervening substance applied closely to it—that the practice became useful. This flat intervening body, made of wood, ivory, or gutta-percha, is called a pleximeter. It is struck either with a small hammer, or plessor, or with one or more finger tips. Instead of an ivory or rubber pleximeter the left index or middle finger of the examiner may be used, with its flat surface fitted accurately to the part under investigation. The force of the stroke on the pleximeter, whether the stroke be made with the fingers or the hammer, must vary according as it is desired to elicit the sound from a superficial or a deep seated part. The surface to be percussed should be exposed or, at most, covered with only one layer of clothing; and the blow should fall perpendicularly on the pleximeter. When percussion is made over a considerable cavity filled with air, as the stomach or intestines, a hollow, drumlike, or tympanitic sound is produced. When any part of the surface of the chest is struck below which there is a considerable depth of healthy lung tissue, consisting of small cells filled with air, a clear sound, less loud and hollow than the tympanitic sound, and termed the pulmonary percussion note, depending partly on the vibrations of air in the lung cells and partly on the vibrations of the walls of the chest, is evolved. When the subjacent substance is solid (as the heart, liver, or spleen) or fluid (as when there is effusion into a closed sac), the sound is dull in proportion to the density and want of elasticity of the part struck.

Auscultatory percussion is practiced when, instead of listening to the percussion sounds as transmitted through the air, the stethoscope is placed upon the chest near the point of percussion and the sound conveyed through it to the examiner's ear. See **AUSCULTATION**.

PERCUSSION, CENTRE OF. See **CENTRE OF PERCUSSION**.

PERCUSSION CAP. See **SMALL ARMS**.

PERCY, pĕr'st. The name of a noble family whose head, William de Percy, accompanied William I to England and obtained from him 30 knights' fees in the north of England. The representation of the house devolved in the

time of Henry I (1100-35) on Agnes, daughter of the third baron, who married Josceline of Louvain, who assumed the Percy name. The head of the family at the time was one of the chief barons who extorted Magna Charta from King John; and the ninth feudal lord in the reign of Edward I (1272-1307) maintained, with others of the greater barons, the spiritual independence of the English crown. This nobleman's great-grandson was a distinguished military commander under Edward III, and, acting as marshal of England at the coronation of Richard II, was created Earl of Northumberland. He subsequently, however, took up arms against Richard and placed the crown on the head of Henry of Lancaster, who became Henry IV. Again dissatisfied with the government, he joined in rebellion with his son, Henry Percy, surnamed Hotspur, for the purpose of transferring the crown to Mortimer, Earl of March. (See **PERCY**, **SIR HENRY**.) The Earl, with the other leaders of this rebellion, fell at Bramham Moor (1408), and his titles became forfeited. These, however, were revived in favor of his grandson, who became Lord High Constable of England and who was killed at the battle of St. Albans. This Earl's son and successor (the third Earl) met a like fate on Towton field, fighting in the van of the Lancastrian army. The fourth Earl was murdered by the populace in Northumberland when ordered by Henry VII to enforce a subsidy. The execution of the seventh Earl by Elizabeth is part of the history of England. The eighth Earl was committed to the Tower on a charge of being concerned in a plot in favor of Mary, Queen of Scots, and died a violent death in prison. The tenth Earl fought in the civil wars against Charles I, though he took no part with the regicides, and eventually joined in the general effort to bring about the Restoration. The eleventh Earl left an only child, who succeeded to the ancient barony of Percy and, marrying Charles, Duke of Somerset, became the mother of Algernon, Duke of Somerset, who was created Earl of Northumberland, with remainder to his son-in-law, Sir Hugh Smithson, of Stanwick, in the County of York, a gentleman of respectable lineage. Sir Hugh, succeeding to the earldom, obtained in 1766 his advancement to the dukedom of Northumberland. Consult Gerald Brenan, *A History of the House of Percy*, edited by W. A. Lindsay (2 vols., London, 1902).

PERCY, FLORENCE. See **ALLEN**, **ELIZABETH CHASE AKERS**.

PERCY, GEORGE (1580-1632). A British Colonial governor, born at Lyon House, Northumberland. He was a younger son of the eighth Earl of Northumberland and, when still young, served in the army in the Low Countries. He sailed for America with the first Virginia colony in 1606, and is said to have named the settlement James Fort. In 1609 he succeeded John Smith as President of the Council until the arrival of Sir Thomas Gates in 1610. In the latter year he was a member of Lord De la Warr's council, and served as Deputy Governor in charge from March, 1611, until the arrival of Sir Thomas Dale in May. He left Virginia in April, 1612, and in 1625 returned to the wars in the Low Countries, where he commanded a company in 1627. He was a bitter opponent of Capt. John Smith, and attempted to show his unworthiness in *A Trewe Relacyon*

of the proceedings and occurrences of moments which have happened in Virginia from the time Sir Thomas Gates was shipwrecked upon the Bermudas An. 1609 untill my departure out of the Country which was in Anno 1612 (1625).

PERCY, HECTOR, COUNT DE LA FERRIÈRE. See LA FERRIÈRE-PERCY, HECTOR, COUNT DE.

PERCY, SIR HENRY (known as Hotspur) (1364-1403). An English military leader, the eldest son of Henry Percy, first Earl of Northumberland. He was knighted by King Edward III at the same time as the future kings, Richard II and Henry IV. The next year under his father's guidance he began that service on the Scottish border in which he won his greatest fame, and in 1385 became Governor of Berwick. Here his restless warfare against Scottish marauders earned him the nickname of Hotspur. As this was the period of the Hundred Years' War, young Percy was several times sent across the Channel to take part in the continental campaigns, but, though he earned the Garter by his achievements against the French, he always came back to the northern border, where he had been made warden of the marches, and it was there that in 1388 he met a host of Scottish invaders under Douglas, March, and Moray, and fought with them the famous battle of Otterburn, which has been immortalized by the ballad of Chevy Chase. Victory was claimed by both armies, but probably what advantage there was lay with the Scotch, who, though they lost in Douglas the most renowned of their leaders, succeeded in capturing Percy. The latter, by some means not clearly ascertained, became free in 1389. In 1399 he joined Henry of Lancaster in his successful rebellion against Richard II—indeed, the Percys claimed that they made the rebellion successful—and after the coronation of the new King as Henry IV he was rewarded by the gift of offices and lands which made the already powerful nobleman almost a rival to the King. It was not long before Henry began to feel that the Percys were too powerful for the well-being of his Kingdom, and when, as a contrast to an unsuccessful campaign of his own against the Welsh, Hotspur won a brilliant victory over the Scotch at Homildon Hill, the King began to withdraw his favor from his formidable vassal. The Percys quickly resented this and, forming an alliance with Owen Glendower, the Welsh leader, the Douglasses, and other Scottish families, raised the standard of revolt in favor of the young Earl of March, whom they proclaimed King of England. Henry met the insurgents near Shrewsbury, and a desperate battle was fought in which Hotspur was killed and his forces defeated. Consult: Froissart, *Chronicles*; Wallon, *Richard II*; Ramsay, *Lancaster and York*; Wylie, *History of Henry IV*; Percy, *Reliques of Ancient English Poetry*.

PERCY, JOHN (1817-89). An English metallurgist, born at Nottingham. He studied medicine at Paris and Edinburgh, but afterward devoted himself to metallurgy, and in 1851 was appointed lecturer, and later professor, in the Metropolitan School of Science, now the Royal College of Science. During his connection with this institution he did much to place English metallurgy on a scientific basis. He discovered a process of extracting silver from its ores, which largely suggested the improved processes later employed in Europe and the United States; and his work also suggested improved processes of making Bessemer steel from iron ores con-

taining phosphorus. In 1876 he received the Bessemer medal of the Iron and Steel Institute (London), of which he was president in 1885-86. He published: *Iron and Steel* (1864; 2d ed., 1875); *Lead* (1870); *Silver and Gold* (1880).

PERCY, THOMAS (1560-1605). An English conspirator. He obtained promises from James VI of Scotland in 1602, which he interpreted as an assurance of toleration for Roman Catholics upon James's accession to the English throne. Being disappointed in his expectations, he joined Catesby, John Wright, Thomas Winter, and Guy Fawkes in the Gunpowder Plot (q.v.). Upon the discovery of the plot Percy fled with the others, but was overtaken and mortally wounded at Holbeche.

PERCY, THOMAS (1729-1811). An English antiquary, editor of the *Reliques of Ancient English Poetry*, born in Bridgnorth, Shropshire, April 13, 1729. He graduated from Christ Church, Oxford, B.A. in 1750 and M.A. in 1753, and proceeded D.D. from Emmanuel College, Cambridge, in 1770. In 1753 he was given the vicarage of Easton-Maudit, Northamptonshire, where he remained 29 years. In 1782 he was appointed Bishop of Dromore in Ireland, where he resided till his death, Sept. 30, 1811. Percy published two most important works. While visiting his friend Humphrey Pitt at Shifnall in Shropshire, he found a folio manuscript (early seventeenth century) "lying dirty on the floor under a bureau in the parlour." This manuscript he made the basis of *Reliques of Ancient English Poetry* (1765), a collection of English ballads, which has been aptly called the Bible of the Romantic movement. It marks the first decisive return in England to the ballad measure, afterward to be so beautifully employed by Coleridge. The publication exerted, too, great influence in Germany. To the awakened interest in Norse mythology Percy contributed *Northern Antiquities* (1770), which was a translation of the introduction to *L'Histoire de Dannemarc* (1755) of Paul Henri Mallet. He also edited *The Household Book of the Earl of Northumberland in 1512* (1768) and thus set the example for many similar publications. As a poet he was best known for *The Hermit of Warkworth* and the ballad "O Nanny, wilt thou gang with me?" Of interest, too, as showing Percy's curiosity, is a translation of a Chinese novel from a Portuguese manuscript (1761). Percy's portrait was painted by Sir Joshua Reynolds, and he was honored by a group of scholars who gave his name to the Percy Society (1840-52), founded for the publication of old ballads. Consult the *Reliques*, edited by H. B. Wheatley (London, 1876-77 and 1891, and New York, 1910; also in Everyman's Library, ib., 1906), and the *Folio Manuscript*, edited by Hales and Furnivall (London, 1867-68); also A. C. C. Gausson, *Percy: Prelate and Poet* (ib., 1908). See ROMANTICISM.

PERCY ANECDOTES. A collection of popular anecdotes which appeared in 44 monthly parts (20 vols., 1821-23). They professed to have been written by "Sholto and Reuben Percy, brothers of the Benedictine monastery of Mount Benger." "Reuben" was really Thomas Byerley (died 1826), editor of the *Mirror of Literature*, while "Sholto" was Joseph Clinton Robertson (died 1852), editor of the *Mechanics' Magazine*. The name of the collection was taken from the Percy coffeehouse in Rathbone Place, London, where Byerley and Robertson were accustomed

to meet. Though Lord Byron declared that no one could pretend to move in polite society without a familiarity with the *Anecdotes*, they are, for all that, of little value or authority. Consult the *Percy Anecdotes*, edited by Timbs (new ed., 4 vols., London, 1887).

PERDICCAS (Lat., from Gk. Περδικκας, *Perdikkas*). The name of several Macedonian kings.—**PERDICCAS I**, the founder of the Macedonian dynasty, an Argive of the Heraclid or Temenid race, who emigrated to Macedonia about 700 B.C.—**PERDICCAS II**, son and successor of Alexander I, reigned probably from 454 to 413. He was friendly to the Athenians in the early part of his reign, but more or less at enmity with them later on and in the course of the Peloponnesian War.—**PERDICCAS III**, brother of Philip of Macedon, was the successor of Alexander, son of Amyntas, and reigned from 365 to 360 B.C.

PERDICCAS. A general of Alexander the Great, a prince of the Macedonian royal line, son of Orontes. He took part in nearly all the important battles fought by Alexander and in the distribution of honors at Susa received for his services a crown of gold and the daughter of the Median satrap for his wife. Alexander on his deathbed gave to Perdicas his signet ring, which was the symbol of royal power. Arrhidæus, the natural son of Philip, being recognized as king, Perdicas was appointed to the chief military command under the new sovereign. He soon, however, established his influence over Arrhidæus and obtained virtual control of the government. A league was at length formed against him by Antipater, Antigonus, Craterus, and Ptolemy. He marched into Egypt to oppose Ptolemy, but was assassinated in 321 B.C., near Memphis, by his own soldiers.

PERDIDO (*Sp. pron. pēr-dē'dō*) **RIVER**. A small river flowing through Perdido Bay into the Gulf of Mexico on the boundary between Florida and Alabama (Map: Alabama, B 5). In 1803, when the United States came into the possession of Louisiana, the Perdido was claimed by the United States as the eastern boundary. Spain protested and was supported by France. The question was finally settled in 1819 by the Treaty of Washington, when west Florida was ceded to the United States.

PERDITA, pēr'di-tā. The daughter of Leontes, King of Sicily, in Shakespeare's *Winter's Tale*, brought up by a shepherd and married to Prince Florizel.

PERDITA. See ROBINSON, MARY (DARBY).

PEREA. See PEREA.

PEREDA, pā-rā'bā, JOSÉ MARÍA DE (1833–1906). A Spanish novelist, born Feb. 6, 1833, at Polanco in the Province of Santander. He was trained to become a military engineer and artilleryman, but, being a man of means, he devoted himself to literature, after the publication of his first volume of sketches of manners, the *Escenas montañosas* (1864). In his chief works Pereda gives pictures of mountaineer and seaside life that are remarkable for detail and charm of description. The *Escenas montañosas* (consult the second series of them, entitled *Tipos y paisajes*, 1871) were long left unnoticed, yet some of the sketches in the volume, and especially that entitled *La leva*, are among his best works. A volume of sketches, *Bocetos al temple* (1876), was followed by the collection *Tipos trashumantes* (1877), exhibiting various common types of the Province of Santander. *El*

buely suelto (1877), an account of the life of an egotistical rake, is interesting as first showing in a marked way the author's inclination to adopt some of the methods of naturalism in the novel. In *Don Gonzalo González de la Gonzalera* (1878) the author sets forth the grotesque character of an electioneering campaign in Spain. In the *Pedro Sánchez* (1883) he portrays the Spanish capital as it was in 1854 and conducts his hero through a career of political intrigue and ugly married life. The *Sotileza* (1884), often deemed Pereda's masterpiece, is a description of life at the seaside and among the fishing folk. His later works include: *La Montañez* (1888); *La puchera* (1889); *Nubes de estío* (1891); *Al primer vuelo* (1891); *Piñas Arriba* (1895); *Pachín González* (2d ed., 1896). A rule of the Spanish Academy was suspended in 1896 so that Pereda, not a resident of Madrid, might become a member. He died in the place of his birth, March 1, 1906. Consult the *Prólogo* of Menéndez y Pelayo, prefacing the first volume of the *Obras completas* of Pereda (Madrid, 1887 et seq.), and the edition of *Pedro Sánchez*, with detailed study of the author and his works by R. E. Bassett (New York, 1907).

PÈRE DUCHESNE, pār dy'shân'. See HÉBERT, JACQUES RENÉ.

PÈRE ENFANTIN. See ENFANTIN, BARTHÉLEMY.

PÈRE GORIOT, pār gō'rē'ō', LE. A novel by Balzac (1835). The title character is an old man devoted, to the point of mania, to his unworthy daughters, who forsake him on his deathbed.

PEREGRINE (pēr'tē-grīn) **FALCON** (OF. *peregrin*, *pelcgrin*, Fr. *peregrine*, from Lat. *peregrinus*, foreign, stranger, from *perager*, being in foreign places, from *per*, through + *ager*, field; ultimately connected with Eng. *acre*). A species of falcon (*Falco peregrinus*) found in almost all parts of the Northern Hemisphere and in Africa and South America. The female is about 18 inches long, the male only about 15 inches. The female is the "falcon" of falconers and the male the "tercel." The peregrine falcon of America is popularly known as the "duck hawk" and is regarded by ornithologists as a subspecies (*anatum*) of the European bird; the form from the northwest coast of America is also regarded as another subspecies (*pealei*). The back, wings, and tail are bluish gray, the feathers barred with a darker tint; the crown, neck, and a spot below the eye nearly black; the throat white with dark longitudinal lines, the breast, belly, and legs whitish with dark bars. The wings reach almost to the tip of the tail, and the bird is remarkable for its power of flight. The peregrine falcon can carry in flying a bird or quadruped fully its own weight. Its ordinary prey consists of ducks, grouse, woodcocks, and rabbits. Owing to the quantity of preserved game the peregrine falcon captures, it is ruthlessly destroyed in Great Britain and is in danger of extermination. It makes its nest on ledges of high rocks and lays from two to four eggs. It nested on the Palisades of the Hudson as late as 1899. Numerous localities in Great Britain have long been noted as breeding places of the peregrine falcon, and some of them are regularly visited for the young birds, which are still trained in certain places for the sport of falconry. For the American

bird, consult A. K. Fisher, *Hawks and Owls of the United States* (Washington, 1893), and Francis Heatherley, *Peregrine Falcon at the Eyrie* (New York, 1913). See Plates of EAGLES AND HAWKS, FALCONS AND FALCONRY.

PEREGRINE PICKLE, THE ADVENTURES OF. A novel by Tobias Smollett (1751).

PEREGRINUS PROTEUS. A Greek Cynic philosopher, of the second century, born at Parium in Mysia. Driven from his native city because he was suspected of parricide, he went ultimately to Palestine and became prominent there among the Christians. Later he was accused of profaning Christian rites and was excommunicated. Presently, in Egypt, under the influence of Agathoboulos, a well-known Cynic, he became himself a Cynic, teaching especially at Athens. After a time various things, especially his attacks on Herodes Atticus, caused his popularity to wane. Hence he gave notice widely that at the Olympian Games of 165 he would destroy himself on a funeral pyre, and this intention he carried out. Consult Lucian (q.v.), *Περὶ τῆς Περεγράνου Τελευτῆς*, *Peri tēs Peregrinou Teleutēs* (The Life's End of Peregrinus), to be found conveniently in F. G. Allinson, *Lucian: Selected Writings*, pp. 200-236 (Boston, 1905). Professor Allinson, in introduction (200-208) and notes, discusses well Peregrinus' life and gives the ancient and modern authorities concerning him. See also Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. II (5th ed., Munich, 1913).

PÈRE HYACINTHE, pâr ê'â'sânt'. See LOYSON, CHARLES.

PEREIRA, pe-râ'rá, JONATHAN (1804-53). An English pharmacologist, born in Shoreditch, London. He studied medicine and was licensed by the apothecaries in 1823, became apothecary and chemical lecturer at the Aldersgate Dispensary in the same year, fellow of the Royal College of Surgeons in 1825, professor of materia medica at the Aldersgate Street Dispensary in 1832, professor of chemistry in London Hospital in 1833, took the degree of doctor of medicine in 1840 at Erlangen, was licensed to practice in London in 1841, and became physician to the London Hospital in 1851. Pereira's attention turned early in the direction of the science of pharmacology, in which he became famous. He published many papers on the properties and adulteration of drugs and many monographs and several textbooks on chemistry. His most important work was the *Elements of Materia Medica and Therapeutics* (1839-40), remarkable for the extent of its research, variety of information, and exactness. He also published a *Treatise on Food and Diet* (1843, 4th ed., 1854), *Lectures on Polarized Light* (1843; 2d ed., 1854), and *The Physician's Prescription Book* (1824, 18th ed., 1890). His other works include a translation of the *London Pharmacopœia* (1824) and *Manual for the Use of Students* (1826).

PEREIRA DA SILVA, pá-râ'rá dâ sêl'vâ, JOÃO MANOEL (1819-98). A Brazilian historian, biographer, and literary critic, born near Rio de Janeiro. He studied law in Paris, traveled in Europe, and returned to Brazil in 1841 an ardent Liberal, but after entering politics became a Conservative. In 1857 he was President of the Province of Rio de Janeiro. His great services were rewarded by various orders. He wrote the valuable historical works *História de fundação do Imperio Brasileiro* (7

vols., 1864-68), *Segundo periodo do reinado de Dom Pedro I do Brazil* (1871), and *História do Brazil durante a menoridade de Dom Pedro II 1831-40* (1882); the biographical sketches *Plutarcho brasileiro* (1866); and in literary criticism, *La littérature portugaise, son passé, son état actuel* (Paris, 1865), and *A poesia epica* (1889).

PEREIRE, pá'râr', EMILE (1800-75) and ISAAC (1806-80). French bankers, distinguished for having instituted schools for the deaf and dumb in France. They were born at Bordeaux. They early carried on at Paris a small brokerage business. By the construction of the railway from Paris to Saint-Germain (1835), the first in France, they established their reputation. In 1852 they founded the Société du Crédit Mobilier (see CRÉDIT MOBILIER), at the collapse of which they lost most of their fortune. They were grandsons of Giacobbo Pereire. Isaac, who was also a deputy from 1863 to 1869, published *La Banque de France et l'organisation du crédit en France* (1864), *Budget de 1877* (1877), and *Politique financière* (1879).

PEREIRE, pá-râ'rá, GIACOBBO RODRÍGUEZ (1715-80). One of the inventors of the deaf-mute language. He was born in Berlanga, Estremadura, of a Spanish-Jewish family, Pereira, but early moved to France. He is credited with being the first person to teach a deaf-mute to speak. He made a demonstration thereof, and of his newly devised sign alphabet, before the French Academy of Sciences in 1749, to the entire satisfaction of the members. In 1759 he was made a member of the Royal Society of London. Consult Edward Seguin, *Notice sur J. R. Pereire* (Paris, 1847).

PÈRE-LACHAISE, pâr-lâ'shâz'. A cemetery of Paris. See LACHAISE.

PERELMAN, pá'rel-man, OSIP ISIDOROVITCH. See ДИМОВ, OSIP (pseudonym).

PERENNIALS (from Lat. *perennis*, lasting throughout the year, from *per*, through + *annus*, year). Plants whose duration is more than two years, contrasted with annuals and biennials. In many herbs the aerial parts are annual, while certain subterranean parts are perennial. As ordinarily used, however, the term is applied to plants whose aerial parts are also perennial, as shrubs and trees. See DURATION.

PERESKIA, pê-rês'ki-â. A West Indian plant belonging to the cactus family. See BARRADOS GOOSEBERRY.

PEREYASLAV, pá-râ-yâs'lâf. A district town in the Government of Poltava, Russia, 176 miles west-northwest of Poltava, near the Dnieper. There are ruins of ancient fortifications. The church of the Assumption was founded as early as 1010, although the present structure dates from the seventeenth century. The town itself dates from 993 and played a very conspicuous part in the history of Little Russia. Its grain trade is important. Pop., 1897, 14,609; 1911, 18,635.

PÉREZ, pâ'râth, ANTONIO (1539-1611). A Spanish statesman, minister of Philip II, born at Monreal de Ariza, Aragon. He was a natural son of Gonzalo Pérez, one of the ministers of Charles V and of Philip, and entered upon administrative duties in 1567, after studying at Louvain, Venice, and Madrid. He was the trusted agent of Philip. In 1578 Juan de Escobedo arrived at Madrid to solicit aid for John

of Austria, then engaged in the struggle against the Netherlands. Escobedo incurred the hatred of the King and of Pérez, and with the consent of Philip Pérez brought about his assassination (March, 1578). The family of Escobedo denounced Pérez as the murderer, and all his enemies joined against him. The King at first sought to shield him, but on learning of the relations between Pérez and the Princess of Eboli, mistress of Philip, he became the secret instigator of Pérez's enemies. In 1589 Pérez succeeded in escaping to Aragon and demanded protection in the courts of that privileged kingdom. The *justicia mayor*, or highest court of justice in Saragossa, refused to deliver him up. The King applied to the Inquisition for aid in 1591, and the Aragonese court surrendered him to its agents, but the people rose and liberated him. At last, in September, 1591, Philip II entered Aragon with a powerful army, abolished the old constitutional privileges of the country, and executed a number of the leaders. Pérez, however, escaped, avoiding the plots which the King laid for his assassination. He was condemned in Spain as a heretic, but was well received in Paris and London. He spent the later years of his life in Paris, and died there Nov. 3, 1611, in great poverty. Pérez wrote an account of his experiences, which was published under the title of *Relaciones* (London, 1594), and other works. Consult: F. A. M. Mignet, *Antoine Pérez et Philippe II* (Paris, 1845); Muro, *Vida de la princesa de Eboli* (Madrid, 1877); J. A. Froude, *Spanish Story of the Armada* (New York, 1892); M. A. S. Hume, "Antonio Perez in Exile," in *Royal Historical Society, Transactions*, vol. viii (N. S., London, 1894); id., *Espanoles & Ingleses* (Madrid, 1903), based on newly discovered manuscripts.

PEREZ, pā'rēts, ISAAC LOEBUSH (1851-1915). A Yiddish and Hebrew writer, born at Zamose, Russian Poland. Supplementing the traditional orthodox Jewish education with secular studies, he took up law, which he practiced until compelled by governmental restrictions to discontinue. He then moved to Warsaw and became secretary of the Jewish Community, a position which he held till his death. All his early work was done in Hebrew, but, seeking a wider audience, Perez soon adopted the more popular Yiddish, which he never afterward abandoned. In Hebrew his works include *Stories in Verse and Miscellaneous Poems* (1877), *Ha-Ugab* (*Love Poems*, 1894), and *Ketabim* (*Collected Writings*, 4 parts, 1899-1901). The first collection of his Yiddish works appeared, under the title *Schriften*, in 1906; a complete edition comprises 10 volumes and includes *Folk Tales* (1909), *Dramas* (1910), *Adam and Eve* (1910), *Chasidisch* (1911), *Sketches and Pictures* (1911), *For Young and Old* (1911), and *The Old and the New* (1912). Perez's works have been translated into several languages, notably into German: in English may be had *Stories and Pictures* (1906). Perez was a great literary artist, at once realist and symbolist, humorist and satirist, poet and essayist, novelist and dramatist. In his fiction, especially in his Chasidic tales, he tells the story of the common people so vividly that one need but read his works to understand the Jew of his day. His dramas, which are not actable, constitute the single exception to the general excellence of his work. As one of the most cultured and intellectual of Jewish writers, Perez did much

to spread progressive ideas and to encourage art and literature among the Jews. Consult Pinès, *Histoire de la littérature judéo-allemande* (Paris, 1910).

PÉREZ DE HITA, pā'rāth dā 'tā, GINÉS. A Spanish soldier and author, of the second half of the sixteenth century. Neither the date nor the place of his birth or death is known, but probably he was a native of Murcia. He served under Philip II during the Alpujarra insurrection, but is better remembered as the author of *Historia de las guerras civiles de Granada* (1595 and 1604), which covers the period from the battle of Alporchones to the death of Alfonso of Aguilar (1501). There is an edition in Rivadeneyra's "Biblioteca de autores españoles," vol. iii (Madrid, 1876). Pérez de Hita's history has served as the basis of many subsequent works, notably Irving's *A Chronicle of the Conquest of Granada*. Its popularity in France is said to have caused the literary movement that began with Mademoiselle de Scudéry's *Almahide* and Madame de Lafayette's *Zaïde*. Consult Marcelino Menéndez y Pelayo, "Orígenes de la novela," in *Nueva biblioteca de autores españoles*, vol. i (Madrid, 1905), and a reproduction of the first edition of the first part (with an uncritical introduction) by Paula Blanchard-Demouge, (*Guerras civiles de Granada, primera parte* (ib., 1913).

PÉREZ DE MONTALVÁN, JUAN. See MONTALVÁN, JUAN PÉREZ DE.

PÉREZ GALDÓS, gāl-dōs', BENITO (1845-). A Spanish novelist, born in the Canaries. In 1863 he went to Madrid to study law, but soon turned to journalism and creative writing. In 1889 he was elected to the Royal Spanish Academy and later to the national Cortes. One of the most prolific of modern Spanish men of letters, Galdós shows evidence of strong revolutionary sympathies. A very important part of his literary work was the composition of the collection of tales known as the *Episodios nacionales*. Of these historical romances, the first two series, embracing 20 stories, were completed in 1883. Writing them under the inspiration of the *romans nationaux* of Erckmann-Chatrian, Galdós gives with historic fidelity and in great detail an account of the struggle for Spanish independence of the Napoleonic invader. The last novels of the second series bring his treatment of political events down to some 15 years after the return to Ferdinand VII. In a third series he continues his epic down to even more recent times, dealing with the Carlist War of 1833-40, the last volume, *Bodas reales*, treating of the marriages of Isabella II and her sister. The fourth series brings the story down to the revolution of 1868 and the exile of Isabella from Spain. A fifth series of 10 volumes, in course of publication in 1915, will carry the account to the close of the century. Galdós ranks well in the domain of the novel, romantic, realistic, and psychological, having written several works generally grouped together as *Novelas de la primera época* and *Novelas españolas contemporáneas*. Of the former group are: *Doña Perfecta* (1876), perhaps his most widely known novel; *Gloria* (1877); *La familia de León Roch* (1878); and *Marianela* (1878). Of the latter are such stories as *El amigo Manso* (1882); *El doctor Centeno*; *Fortunata y Jacinta* (1887); *Miau* (1888); *Angel Guerra* (1891); and especially *Nazarín*

and *Misericordia*, which by many are considered his best works. The vogue of these novels has been even greater than that of his *Episodios nacionales*. In general they exhibit the contrast between old and blindly conservative elements of Spanish life on the one hand and the new revolutionary ideas of the modern world on the other. The plays of Galdós are inferior to his novels. Chief among them are: *Realidad* (1892); *La loca de la casa* (1893); *La de San Quintín* (1894); *Los condenados*; *Voluntad*; *Doña Perfecta* (1900); *La fiera*; *Elcetra* (1901), which created a furore and was of lasting influence; *El Abuelo* (1904); *Bárbara* (1905). Consult: Alas, B. Pérez Galdós: *estudio crítico-biográfico* (2d ed., Madrid, 1889); Pardo Bazán, *Polémicas y estudios literarios* (ib., 1892); and Luis Antón del Olmet and Arturo García Carraffa, *Galdós* (Madrid, 1912).

PERFALL, pər'fal, ANTON, BARON (1853-1912). A German novelist, born in Landsberg. He was educated at Munich, there married an actress, Magda Irschik, with whom he made an American tour in 1879, and later settled at Sehlersee in Bavaria. Among his novels treating social-political themes, and several collections of stories, may be mentioned: *Ueber alle Gewalten* (1889); *Damon Ruhn* (1889); *Truggeister* (1892); *Die Sünde* (3d ed., 1896); *König Erfolg* (1899); *Verkauftes Genie* (1900); *Die Uhr* (1901); *An der Tafel des Lebens* (1902); *Munchener Kindeln* (1904); *Allerhand Lebendiges* (2d ed., 1905); *Aus meinem Jugerleben* (1906).

PERFECTION, CHRISTIAN. See HIGHER LIFE.

PERFECTIONISTS. The name adopted by John Humphrey Noyes (q.v.) and his early followers. Their first settlement was at Putney, Vt., whither he retired soon after beginning to preach his peculiar views in 1834, and where he gradually gathered about him a small school of believers. His views were expressed in a paper, the *Perfectionist*, published at Putney, 1843-46. In accordance with the teaching of Noyes they held that Christ had actually returned to earth before the close of the Apostolic age, that his work of saving from sin was complete, and consequently all who were willing to accept his divine reign lived "no longer under law, but under grace" and could do no wrong. The aim being to live together as one family, all possessions were held in common, and a system of complete communism was gradually worked out, involving the institution of "complex marriage." The community was broken up in 1847 by the opposition of their neighbors. The members who held together founded the Oneida Community (q.v.). Consult W. A. Hinds, *American Communities and Co-operative Colonies* (2d rev. ed., Chicago, 1908).

PERFECT NUMBER. A number equal to the sum of its aliquot parts, with unity added; e.g., 6 is such a number since $6 = 1 + 2 + 3$. If the sum of the aliquot parts is greater or less than the number itself, then the latter is called respectively a *redundant* or *defective* number ($8 > 1 + 2 + 4$; $12 < 1 + 2 + 3 + 4 + 6$). This classification is due to the Pythagoreans.

PERFUMERY (from *perfume*, OF. *per-fumer*, Fr. *parfumer*, to perfume, from Lat. *per*, through + *fumare*, to smoke, from *fumus*, smoke; connected with Skt. *dhūma*, smoke). A substance which is prepared for use on account of its agreeable odor. Perfumes have been used

from the earliest times. Among the nations of antiquity an offering of delicate odors was regarded as a token of respect and homage. The burning of incense formed a part of the Hebrew as of pagan rituals, and hence its use is frequently referred to in the Old Testament. This practice still continues, particularly in the ceremonials of the Roman Catholic church. The use of perfumes was common among the Greeks and Romans, and both Pliny and Seneca possessed considerable knowledge respecting perfume drugs. Among the Athenians perfumes were used at feasts, at funerals, and in theatres, the odor of the violet being generally preferred. Both nations learned the use of the still from the Egyptians and applied it to the manufacture of perfumes. The Arabs were skilled in the preparation of fragrant waters, and it was from them, through the Crusaders, that the art was reintroduced into mediæval Europe. The discovery of the process of distillation, which seems to have been forgotten, gave in the fifteenth century fresh impetus to this industry, and at its close distilled oils of benzoin, cedar, cinnamon, rose, and rosemary were articles of commerce.

Perfumes may be divided into two general classes, viz., natural perfumes and the artificial or synthetic perfumes. Natural perfumes are of animal or of vegetable origin; artificial perfumes are chemical compounds which resemble natural perfumes in their odor. Artificial perfumes are also of two general classes. In one the compounds which produce the perfume in nature have been discovered and then reproduced synthetically, this is the case with vanillin. In the other only the odor of the natural perfume is imitated in a substance which is itself unlike the substance whose odor it possesses; this is true of artificial musk.

The four principal animal perfumes are musk, civet, ambergris, and castor. *Musk* is the dried secretion of the preputial follicles of the musk deer. A similar substance is secreted by the musk ox, muskrat, and the Florida alligator. *Civet* is secreted by the *Viverra civetta* and *Viverra zibetha*. It is found in a double pouch under the tail, from which it is taken from the living, caged animal, two or three times a week. *Ambregris*, a biliary secretion of the spermæcti whale, is supposed to be produced by a diseased condition of the organs. It is found floating on the sea. *Castor* is a glandular secretion of the beaver. When fresh it is in a semiliquid condition and is prepared for commerce by drying in smoke. The animal perfumes are valuable for the permanence which their presence imparts to the more evanescent vegetable odors.

The list of vegetable perfumes, if complete, would be very long. The odor of plants may be found in the leaves, as in sage, thyme, and mint; in the bark, as in cinnamon and cassia; in the wood, as in cedar and sandalwood; in the flower petals, as in the rose and violet; in the seeds, as in anise and caraway; in the roots, as in the orris; in the fruit rind, as in the orange; or it may be secreted in the form of resinous gum from the tree itself, as the camphor and myrrh. Perfumes of the last-named class have been used from time immemorial.

A series of patient experiments conducted during the latter half of the nineteenth century by Grimaux, Lauth, and other chemists, resulted in the discovery that natural odors could be reproduced in the laboratory by combining the

substances which produce such odors in nature. The synthesis of vanillin, the active odorous ingredient of the vanilla pod, by Tiemann and Haarmann, marked the beginning of the manufacture of artificial perfumes on a commercial basis. Tiemann discovered that coniferin, the glucoside found in the sap of the pine, could be split up, by means of hydrolyzing agents, into glucose and coniferyl alcohol, of which vanillin is the aldehyde. Later it was found that the same substance could be produced more cheaply by the oxidation of eugenol, the chief constituent of the oil of cloves, and it is from this source that artificial vanillin is manufactured. The industry has acquired considerable importance both in Europe and America. Another important perfume is ionone, or the artificial odor of violets. It is obtained by condensing citral with ordinary acetone in the presence of an alkali, the resulting product being then treated with dilute acids. Mirbane oil, the artificial oil of bitter almonds, is derived from benzene. The benzene is treated in a still with two parts of fuming nitric acid and one part of concentrated sulphuric acid. These acids are added slowly, and at the end of the chemical reaction the liquor, on adding water, separates into two layers, one of which, on further purification, produces the mirbane oil. Many other synthetic perfumes have been discovered, some of which are produced as the by-products of other industries, or from what were formerly regarded as purely waste materials. The manufacture of artificial musk was introduced by Baur in 1888. A mixture of isobutyl chloride and toluene is heated with aluminium chloride ("Friedel and Crafts' reaction"). Water is added to the product of this reaction, the compound is distilled, and the distillates are collected and treated with nitric and sulphuric acids, and the product is washed with water. When treated with alcohol, crystals having a marked odor of musk are produced. At the present time perfumers use the synthetic products extensively, blending them successfully with the natural products. The terms quadruple, triple, double, and simple refer to strength, 12 parts of triple extract will furnish 20 parts of double or 30 of simple by dilution with water and alcohol.

The processes employed in obtaining natural vegetable perfumes are described under OILS, *Volatile or Essential Oils*.

The centre of the natural perfumery industry has for many years been in Grasse, France, in whose factories, it is said, the product of 5,500,000 pounds of orange blossoms, 4,400,000 pounds of roses, 1,400,000 pounds of jasmine, 800,000 pounds of violets, and 80,000 pounds each of cassia and tuberose is used annually. The culture of flowers for perfumery is carried on also in Turkey, Bulgaria, Arabia, India, and Syria. In the United States, according to the census of 1910, there are 429 establishments engaged in the manufacture of perfumery and cosmetics; the total number of employees, 2375, and the total value of the product, \$14,212,000. According to the United States Statistical Abstract for 1914 the value of perfumeries and other toilet preparations imported was \$2,309,000, while for 1890 it was \$444,964.

PERGA, APOLLONIUS OF. See APOLLONIUS OF PERGA.

PERGAMON, **PERGAMUM**, or **PERGAMUS** (Lat. from Gk. Πέργαμον, Pergamon, Πέργαμος, Pergamos, Pergamos). An ancient city of Mysia, in Asia Minor, capital of the kingdom of the same name (Map Greece, Ancient, E 2). The city lay in the valley of the Caicus, about 15 miles from the coast. The Acropolis is a lofty hill, about 1000 feet in height, situated between the streams Selnus and Cetus, of which the former flowed through the later lower city, now partly covered by the modern town of Bergama. The early history of the place is lost in legend, which declared that the Greek inhabitants came from Arcadia under Telephus, son of Heracles by Auge, and that the name was derived from Pergamos, grandson of Achilles. In the fourth century B.C. it was the seat of a Greek population, but it was not till the early third century that it rose to prominence. Its impregnable Acropolis was chosen by Lysimachus as a hiding place for his treasure of 9000 talents (about \$10,000,000), which he intrusted to a certain Philetarus. In 283 B.C. a revolt of Asiatic cities against Lysimachus enabled Philetarus to become master of the place, and the defeat and death of Lysimachus, two years later, enabled him to consolidate his power, at first in dependence upon the Seleucidae of Syria, but later as independent ruler of the neighboring regions of Mysia and the Troad. In 263 B.C. he was succeeded by his nephew Eumenes I (263-241), who maintained his power against the attacks of Antiochus I of Syria and developed the resources and prosperity of his little kingdom, which he ruled under the title of dynast. His cousin and successor, Attalus I (241-197), really placed the new principality on a firm basis through his victories over the Gauls and Antiochus II, whereby he became master of a great part of northwestern Asia Minor, and, though later he was compelled to relinquish part of his conquests, his wise policy of allying himself with the distant power of Rome, against his neighbors of Syria and Macedon, enabled him to leave a well-established kingdom to his son Eumenes II. In addition to his military and political ability Attalus, who assumed the royal title after his defeat of the Gauls, did much to make his capital the centre of the artistic and literary life of Asia. He erected near the city a splendid temple and grove in honor of Athena Nikephoros (bringer of victory) and also splendid artistic monuments of his triumphs. To these groups belonged the bronze originals of the well-known Dying Gaul of the Capitol and the Gaul and his Wife of the Ludovisi collection in Rome. At Athens he erected the stoa of Attalus and placed on the Acropolis a series of small bronze figures representing the battles of the Athenians with the Amazons and the Persians, the Gods with the Giants, and the Pergamenes with the Gauls, possibly reduced copies of his monuments in Pergamum and now known to us in part through a series of small marble figures in Naples, Rome,

Venice, and Paris. Eumenes II (197-159) continued the Roman policy of his father and was rewarded after the defeat of Antiochus the Great with the greater part of Asia Minor, except Lycia and Caria. To his reign belong the great altar of Zeus and the development of the great library, which seems to have been founded by Attalus I. (For the former see PERGAMON, GREAT ALTAR OF.) The library was established by the King in the halls which surrounded the temple of Athena Polias above the Agora and was enriched with a collection of books rivaling the foundation of Ptolemy at Alexandria. (See LIBRARIES.) Here, too, was gathered a band of scholars about Crates of Mallos, who developed a school of grammatical study, which in opposition to the Alexandrians emphasized the anomalies rather than the analogies of language. (See ANOMALISTS AND ANALOGISTS.) To Pergamon was attributed the invention of a fine parchment (q.v.) for use in books when the jealousy of the Egyptians endeavored to check the activity of the Pergamenes by prohibiting the export of papyrus paper. Under the brother of Eumenes II, Attalus II (159-138 B.C.), the traditional policy of friendship with Rome was continued and the prosperity and power of the little kingdom increased by successful wars with Bithynia and Thrace. His nephew, Attalus II (138-133), was a student and writer, especially on agriculture, zoölogy, and botany. He left no heirs and by his will bequeathed his kingdom freed from under Roman protection. An attempt of a pretender, Aristoniceus, to seize the power led to Roman intervention, and in 129 B.C. the Province of Asia was organized with Pergamon as its capital. The city long remained in this position, the seat of a provincial council and an important centre of Asiatic trade. On the summit of the Acropolis was the temple of Augustus and Rome, and later a temple to Trajan was added. It seems to have declined under Byzantine rule, though its strategical importance led to the fortification of the hill with a strong wall. Under Turkish rule this fortress was abandoned, but the unfortified town in the plain continued to exist and is now a thriving place of some 20,000 inhabitants, bearing the name of Bergama. The recovery of Pergamon is due to Carl Humann, a German civil engineer, whose attention was attracted to the place during a visit in 1864, when he observed the destruction of the ancient remains. After much effort he induced the Berlin Museum to begin excavations in 1878, and when the third campaign, directed by Humann and A. Conze, closed in 1886, the upper Acropolis had been cleared, including the site of the altar and the library. In 1901 new explorations under W. Dörpfeld were begun on the lower slopes of the hill, with the avowed intention of recovering so far as possible the city of Eumenes. Besides the remains of the altar, already mentioned, important ruins of a Roman theatre, amphitheatre, and circus were found. The sculptures recovered are partly in Berlin, where the Great Altar has been set up in its old form, in the Kaiser Friedrich Museum, and partly in Constantinople.

Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., ib., 1914).

PERGAMON, GREAT ALTAR OF. A magnificent structure erected during the reign of Eumenes II (197-159 B.C.) in the market place at Pergamon and dedicated to Zeus Soter and Athena Nikephoros. The occasion of its erection was the defeat of the Gauls (the Galatians of the New Testament) by the people of Pergamon under Eumenes. See GALATIA.

This altar was discovered during extensive excavations carried on at Pergamon by the Germans, from 1878 on, first under the direction of Humann and Conze and later under that of Dörpfeld. The first indications of the existence of the monument, which is mentioned but once in ancient literature—unless the "throne of Satan" (Rev. iii. 13) refers to it—in Ampelius, *Liber Memorialis: Miracula Mundi*, xiv, were discovered when certain carved slabs of marble were found by Humann in the fortifications of the town. The discovery of these led eventually to the location of the monument itself in the market place at the southern end of the Acropolis.

The structure, now reerected in Berlin, consisted of an almost square podium (37.7 × 34.6 meters), which rested upon a few steps. Upon this podium rested a frieze 2.3 meters tall, which in turn was crowned by an Ionic cornice. The top of this base was inclosed on three sides by an Ionic colonnade, while the fourth side, by a flight of 24 steps cut out of this side of the base, gave access to the inclosed area on top of the monument in which stood the altar. See ALTAR.

The chief interest in the structure lies in the splendid frieze which decorates the base. Originally this sculptured band, over 7 feet in height, was 120 feet long; now but 80 feet remain. The subject represented is the battle of the Gods with the Giants, as symbolic of the Greeks defeating the Gauls, and in it the most furious action is displayed. A secondary frieze, depicting the story of Telephus, decorated the inside of the colonnade on the top of the monument. The work exhibits consummate workmanship combined with the academic insistence upon accuracy of detail so peculiar to the late Greek period of art. The work is the type *par excellence* of the Hellenistic age. Consult: *Altertümer von Pergamon*, published by the Royal Museum (Berlin, 1890 et seq.); Maxime Collignon, *Histoire de la sculpture grecque*, vol. ii (Paris, 1892); E. R. O. von Mach, *Greek Sculpture: Its Spirit and Principles* (Boston, 1903); Kaiserlich Deutsches Archäologisches Institut, *Mittheilungen: Athenische Abtheilungen*, vol. xxxiii (Athens, 1908).

PERGAMUM, PERGAMUS. See PERGAMON.

PERGAMUM, ORIBASIIUS OF. See ORIBASIIUS OF PERGAMUM.

PERGER, pēr'gēr, RICHARD VON (1854-1911). An Austrian composer, born in Vienna. He studied under Brahms; served in 1890-95 as director of a conservatory at Rotterdam, where he succeeded Gernsheim as conductor of concerts. In the latter year took charge of the Vienna Gesellschaftskonzerte, and two years later assumed also the direction of the Vienna Männergesangsverein. In 1899-1907 he was director of the Vienna Conservatory. His compositions include a comic opera, *Der Richter von Granada* (1889); a singspiel, *Die 12 Nothelfer* (1891); *Violin Concerto in C Minor* (1894); *Das stählerne Schloss* (1904). He also wrote an excellent biography of Brahms (1908).

PERGOLESI, pār'gō-lā'zē, or **PERGOLESE**, -lā'zā, GIOVANNI BATTISTA (1710-36). An eminent composer of the Neapolitan school, born at Jesi. In 1747 he was admitted into the Conservatorio dei Poveri di Gesù Cristo at Naples, where he studied the violin under Domenico di Matteis and composition under Gaetano Greco and Durante. Under the conviction that melody and taste were sacrificed to learning by most of the masters of his time, he abandoned the style of Scarlatti and Greco for that of Vinci and Hasse. His first great work was the oratorio of *San Gagliardo d' Aquitania*, composed in 1731. Two years later appeared his opera *La serva padrona*, which gained him universal fame and which has remained one of the finest examples of its genre; strangely enough, it was practically his only stage success. In the same year he composed *Il prigioniero superbo* and *Il frate innamorato*; in 1734, *Adriano in Siria*, in 1735, *Il Flaminio* and *L'Olimpiade*. In 1734 he received the appointment of *maestro di capella* of the church of Loreto. In consequence of delicate health he removed to Pozzuoli, where he composed the cantata of *Ofelio* and his pathetic *Stabat Mater*. Besides the above mentioned works Pergolesi composed a number of pieces for the Church, which were better appreciated during his lifetime than were his secular compositions, also a violin concerto, and 30 trios for violin, violoncello, and harpsichord. His works are all characterized by sweetness and freedom of style. His orchestration was particularly simple, confined chiefly to the strings, reinforced occasionally by the horns and trumpets. An undoubted reason for the contemporary failure of much of his operatic music was his innovation in style, wherein he abandoned the old contrapuntal accompaniments and supported his melodies and voices with harmonically written accompaniments. He died of consumption at Pozzuoli. Consult H. M. Schletterer, "Giovanni Battista Pergolesi," in *Waldersee's Sammlung*, No. 17 (Leipzig, 1880), and R. Barchiesi, *Il passaggio d'un genio. Giambattista Pergolesi* (Milan, 1911).

PERGOLESI, pār'gō-lā'zē, MICHEL ANGELO. An eighteenth-century Italian decorative designer and painter, who went to England to work in the architectural studio of Robert Adam. Furniture and a chandelier designed by him are illustrated on Plates 58-61 of Constance Simon's *English Furniture Designers* (London, 1905). The best opportunity, however, to study Pergolesi's style is afforded by his own *Designs for Various Ornaments on Seventy Plates* (London, 1777-1801). He designed not only furniture but silver plate, also paint and compo orna-

ments for walls and ceilings. His work is so like that of Robert Adam as often to be mistaken for it, but it is distinctly more French in feeling and nearer to what was done in Paris in the reign of Louis XVI. Details of Pergolesi's life are lacking.

PERI, pā'rē (Fr. *péri*, Pers. *pari*, *perī*, fairy, Pahl. *parik*, evil genius, Av. *parikā*, female demon). In Persian folklore, a class of fairies, both male and female, of surpassing beauty. In the old Iranian religion, on the other hand, the Peri was a female demon or enchantress of the utmost malignancy. Such a change of concept of a godling from maleficent to beneficent as is found in this instance is a rare phenomenon in comparative religion, although the transformation of the gods of one religion into the demons of another frequently takes place. The Peri play a prominent part in Moore's *Lalla Rookh* as well as in the musical compositions based on this poem by Schumann (*Das Paradies und die Peri*) and Bennett (*Paradise and the Peri*).

PERI, pā'rē, JACOPO (1561-1633). An Italian musician, the originator of the new declamatory style (*stilo rappresentativo*) which led to the establishment of opera. He was one of the musicians that met at the house of Bardi and Corsi, where the efforts to reconstruct the music to the Greek tragedies resulted in the evolution of a new recitative suited to dramatic declamation. In 1597 Peri applied the theories of his group in the composition of *Dafne* by Rinuccini, thus writing the first opera, which was produced the same year and received with immense enthusiasm. In 1600 he wrote *Euridice* on a text by the same poet. A few months later, within the same year, Caccini (qv.) composed the identical text, claiming to be the originator of the new style. Recent investigations, however, have established the priority of Peri's work beyond a doubt. Together with Monteverde he wrote *Ariadne* (1608). From 1600 till his death he was general music director at the court of Florence. He died in Florence. See CACCINI, OPERA.

PERIAGUA, pēr'ē-a'gwā. See PIRAGUE.

PERIANDER (Lat., from Gk. Περίαςδρος, *Periandros*). A tyrant of Corinth from about 625 to 585 B.C. He was a son and successor of the tyrant Cypselus. He was energetic as a warrior and distinguished as a patron of poetry and music and is by some reckoned as one of the Seven Wise Men of Greece; many wise maxims were ascribed to him. He was, however, cruel and despotic. He is said to have put to death his wife, Melissa, while his son Lycophron was sent to reside at Coreyra, which was then under Periander's rule. Later, when Periander, wishing to see his son, undertook to visit Coreyra, the Coreyreans, terrified at the prospect and hoping to avert the visit, put Lycophron to death. Periander, as tyrant, had under his sway, besides Corinth, also Coreyra, Ambracia, Leucas, and Anaclorum. Among other forms of literature he is said to have cultivated elegiac poetry especially. Psammetichus, son of Gordius, the last of the Cypselid dynasty, succeeded him.

PERIANTH (from Gk. περί, *peri*, around + ἄθος, *anthos*, flower). A general name of the sepals and petals of a flower and usually used when the two sets do not differ in appearance, as in a lily. See FLOWER.

PERIBLEM (from Gk. περίβλημα, *periblema*, cloak). The embryonic region near the growing

tip of stems and roots which lies outside of the pterome (q.v.) and develops into the cortex. In seed plants (spermatophytes) it is covered by the dermatogen, the embryonic layer which develops the epidermis; but in fern plants (pteridophytes) it forms the outside of the stem tip. See STEM.

PERIBONKA. A northern tributary of Lake St. John (q.v.), Canada, over 400 miles long.

PERICARDITIS (Neo-Lat., from *pericardium*, from Gk. *περικάρδιον*, *perikardion*, membrane around the heart, neut. sing. of *περικάρδιος*, *perikardios*, around the heart, from *περί*, *peri*, around + *καρδία*, *kardia*, heart). An inflammation of the membranous sac investing the heart—the pericardium (q.v.). This membrane is composed of two layers, the surfaces of which are normally in contact and secrete a thin serous fluid which acts as a lubricant and prevents irritation from the constant movement of the surfaces upon each other. The intervening space, which exists only in pathological conditions, is called the pericardial cavity. In common with all serous membranes (q.v.) the pericardium is subject to two varieties of inflammation—the dry or plastic form and that characterized by effusion of fluid. In the dry variety, which is most common and least dangerous, there is first a dulling of the surfaces involved, due to a fibrinous exudation, constant rubbing roughens these fibrin-coated surfaces; the plastic, sticky material is thrown into ridges or drawn out into shreds and presents a curiously shaggy appearance—the so-called *cor villosum* or hairy heart of the older writers. This form of pericarditis may terminate by absorption of the fluid, always leaving, however, an adhesion between the two layers; or the process may go on to the moist form—pericarditis with effusion. Here an extravasation of fluid occurs into the pericardial cavity amounting from a few drams to two quarts. This fluid is at first serofibinous or hemorrhagic, but in some cases becomes rapidly purulent. When the amount of fluid is considerable the heart's action is mechanically interfered with, and death may take place from this cause in a few days.

Pericarditis may arise from many causes. The primary form, unassociated with any other disease, is comparatively rare and occurs only in children. As a secondary process it is a common affection. Rheumatism is responsible for more than 50 per cent of the cases, septic processes in other parts of the body are frequent causes: tuberculosis, gout, Bright's disease, scurvy, diabetes, and the eruptive fevers such as scarlatina and typhoid may be complicated by it; and, lastly, it may take place by extension from neighboring structures, as in pleuropneumonia or septic endocarditis, or it may result from a wound.

The symptoms are precordial pain, palpitations, a dry cough and hurried respiration, discomfort or pain on lying on the left side, restlessness, great anxiety of countenance, and sometimes delirium. The pulse usually beats from 110 to 120 in a minute and is sometimes intermittent, and febrile symptoms are always present. Pericarditis may terminate fatally in 48 hours or less. In ordinary cases, however, which terminate in apparent recovery, the disease generally begins to yield in a week or 10 days and, excepting that adhesion remains, the cure appears to be complete in three weeks or

less. But although these patients apparently recover, the pericardial adhesion commonly occasions other structural changes of the heart sooner or later.

In this disease the patient must be kept absolutely quiet, so as to throw as little work upon the heart as possible. In the early stages and in robust people leeches may be applied over the pericardial area, or ice bags may be used to limit effusion. When effusion has taken place a blister will sometimes cause it to be absorbed. In suitable cases diuretics may be given to promote the action of the kidneys, and mild purgation will be of service. When the effusion is so extensive as seriously to embarrass the heart's action, it may be drawn off by paracentesis (q.v.). If the fluid be purulent, however, an incision must be made into the sac, through the chest wall, and the cavity drained. See HEART, DISEASES OF THE.

PERICARDIUM (Neo-Lat., from Gk. *περικάρδιον*, *perikardion*, membrane around the heart). A conical membranous sac, containing the heart and the commencement of the great vessels, to the extent of about 2 inches from their origin. It is placed with its apex upward behind the sternum, and to its left side, in the interval between the pleura, the serous sacs in which the lungs are inclosed; while its base is attached to the diaphragm. It is a fibroserous membrane, consisting of an external fibrous and an internal serous layer. The fibrous layer is a strong, dense, fibrous membrane, the serous layer invests the heart, and is then reflected on the inner surface of the fibrous layer. Its inner surface is smooth and glistening and secretes a thin fluid which serves to lubricate the pleural surfaces. Inflammation of this serous sac constitutes the disease known as pericarditis. See HEART, PERICARDITIS.

PERICARP (from Gk. *περικάρπιον*, *perikarpion*, pod, from *περί*, *peri*, around + *καρπός*, *karpós*, fruit). The transformed wall of the ovary in the fruit. For example, a pea pod without the peas is the pericarp. See FRUIT.

PERICLES, *pér'iklēs* (Lat., from Gk. *Περικλῆς*, *Periklēs*) (? 429 B.C.). The greatest statesman of ancient Greece. His father was Xanthippus, victor over the Persians at Mycale in 479 B.C. His mother was Agariste, the niece of Cleisthenes, the lawgiver. He received a careful education and was especially influenced by two of his teachers, Damon, a famous sophist and master of music, and the philosopher Anaxagoras of Clazomenae, to whose teaching he undoubtedly owed the independence of thought and freedom from superstition which raised him above the multitude. Throughout his life Pericles was conspicuous for his singular dignity and aloofness. He avoided convivial gatherings and seldom walked abroad among his fellow citizens. But his eloquence, sagacity, uprightness, and patriotism won recognition from a large part of the Athenians, and for more than 30 years he was the most influential leader in Athens. When he entered on public life Aristides had only recently died. Themistocles was an exile, and Cimon was engaged in fighting abroad. Pericles from the first attached himself to the democratic party, and under his leadership the complete democratization of Athens was accomplished. Hitherto only the nobler and richer elements in the state had had access to the higher offices, but under his direction all offices were eventually opened to the entire body of citizens. The

first step in this new course was the limitation of the functions of the Areopagus, at that time the chief court at Athens. Through the agency of Pericles' associate, Ephialtes, in the year 462-461 measures were passed which deprived the Areopagus (q.v.) of all its important political powers. To it were left jurisdiction only in cases of homicide, the care of the sacred olive trees of Athena, and a share in the supervision of the land sacred to the Eleusinian divinities. Its former functions passed to the Athenian Senate of 500, the popular assembly, and the law courts. Pay for archons was introduced, and later all officials received a salary for their services. About 458 the third class of citizens, the Zeugitae, were made eligible to the archonship, and it cannot have been many years before this office was open to all, even the lowest citizens. Furthermore, the members of the Senate were now chosen absolutely by lot from the entire body of Athenians. Thus in a few years after Pericles became prominent most important constitutional changes were carried through at Athens. The opposition of Cimon had been avoided by his ostracism (q.v.). Pericles' foreign policy seems to have been based on a desire to extend the power and influence of Athens as widely as possible over the Greek states, and he confidently hoped to consummate an Hellenic league which should embrace all Greek states. His attempt to hold a congress for this latter purpose in 448 was unfortunately defeated.

The Athenians, elated by their victories over the Persians and fired by the splendid empire established under the name of the Confederacy of Delos (see *DELOS*), were eager for foreign conquest. As their naval empire grew and their trade increased, they came into rivalry with Corinth and Aegina. In 460 they had seized Megara, an act which led to war with the Spartans, and during the next four years Athens successfully resisted the attacks of Corinthians and Spartans, and in 459-456 reduced Aegina, which was made a tributary member of the Confederacy of Delos. Athens had seized Naupactus also, which gave her a naval station by which she could command the Corinthian Gulf. She also extended her conquest to the north, and by the battle of Oenophyta (457) gained the greater part of Boeotia, only to lose it again 10 years later by the battle of Coronea. The war with Persia had continued in the East under the direction of Cimon, who had been recalled at Pericles' suggestion. After Cimon's death in 449 Pericles seems to have thought the struggle against Persia too severe a tax on Athens if she was to continue her efforts against her rivals in Greece, and so in 448 a peace was concluded with the Persians. Athens was now free to attend to her cares at home. She had gradually extended her territory so that, aside from her allies on the mainland, she embraced, under the Confederacy of Delos, as equal or subject allies, nearly all the larger islands of the Aegean, and she furthermore possessed important cities in the north and in the Thracian Chersonese. In 446-445 a 30 years' peace was concluded between Athens and her allies on the one side and the Peloponnesians and their allies on the other. There was, however, strong opposition to Pericles' policy. The party opposed to him was led by Thucydides, whose ostracism in 444 left Pericles the undisputed leader. He apparently had the power to persuade the people to do whatever he thought good, and for 15 years after his

opponent's ostracism he was annually elected to the office of general. Under his direction Athens had been made supreme within her naval empire, and his purpose was to aggrandize Athens even at the expense of her subject states. With the great wealth which came to her treasury Pericles restored the temples destroyed by the Persians and erected new monuments which made Athens the most magnificent city of the ancient world. Most prominent among these monuments were the bronze statue of Athena Promachos, which was erected about 448 at the west end of the Acropolis, and a new temple to Athena Polias. The Parthenon (q.v.) was also built on an enlarged and more magnificent scale. At the west entrance to the Acropolis a new propylaeum was erected; on a projection at the southwest corner of the Acropolis the temple of Athena Nike was built. The city was also adorned with many other temples and monuments. In the period of Pericles' leadership Athens became a great centre of literature as well as of the fine arts, and philosophy was also transplanted from Ionia and Italy to the soil of Athens, which was destined to be its home for a thousand years. Pericles was not only a great political leader, but was also able in the field, as was shown by his successful reduction of the revolt of Samos in 439.

Athens's prominence at length made her an object of jealousy. In 433 she formed an alliance with Coreyra, a recalcitrant colony of Corinth, and in the winter of 432-431 the Peloponnesians under the leadership of Sparta decided on war against Athens. Pericles summoned the country residents of Attica within the walls of Athens, and allowed the Peloponnesian army to harry the country at will during the summers of 431 and 430. In the latter year plague broke out in the city and caused many deaths and great dejection. Pericles was deposed from his office, tried, and fined, but soon reinstated through a revulsion of feeling. In the following year he died after a lingering sickness. While Pericles undoubtedly contributed greatly to Athenian brilliancy, his imperialistic schemes made the Peloponnesian War inevitable. (See *ASPASIA*.) W. Lloyd, *The Age of Pericles* (2 vols., London, 1875); Adolf Schmidt, *Das Perikleische Zeitalter* (Jena, 1877-79); Evelyn Abbott, *Pericles and the Golden Age of Athens* (New York, 1891); J. B. Bury, *Ancient Greek Historians* (New York, 1909). See *GREECE, History, Ancient History*; *GREEK ART, The Temple and II, (b) Age of Phidias*; and *Plate of GREEK ART*.

PERICLES, PRINCE OF TYRE. A play remodeled by Shakespeare, probably from one by George Wilkins and Rowley, and produced about 1607. It was printed in 1609, but is not in the folio of 1623. The earliest form of the story is Greek in the sixth century. Gower introduced it as "Apollonius of Tyre" in the *Confessio Amantis* (1332). Shakespeare's part is evidently acts iii, v, and partly iv.

PERICYCLE (from Gk. *περίκυκλος*, *periky-klos*, all around, spherical, from *περί*, *peri*, around, + *κύκλος*, *kyllos*, circle). A sheath of more or less active cells in vascular plants forming the outer layer of the stele (q.v.), within which the vascular cylinder is developed. It is

usually continuous and of a variable number of cells in depth, but in rare cases it is lacking entirely. It abuts against the innermost layer of the cortex (q.v.), which is called the endodermis. In roots it is usually the pericycle which gives rise to the endogenous branches.

PERIDINIUM. See RED WATER.

PERIDOT, pĕr'i-dōt (Fr. *péridot*, of unknown etymology). A variety of chrysolite used as a gem. It is usually of an olive, pistachio, or leek-green color. It is found in abundance and of good quality in the form of small, olive-green, pitted grains or pebbles, especially in the sands of Arizona and New Mexico, where they are called locally Job's tears. The best quality for gems comes from the Levant. See CHRYSOLITE.

PERIDOTITE, pĕr'i-dō-tit. An igneous rock of ultrabasic composition, essentially free from quartz and feldspar, but consisting mainly of olivine and of one or more of the following minerals: augite, hypersthene, hornblende, magnetite, and rarely biotite. The peridotites are sometimes known as the magnesian rocks (see also PERKNITE), and as they are poorest in silica and richest in magnesia of all terrestrial rocks, they form a connecting link with celestial (meteoritic) bodies. From the family of the pyroxenites peridotites differ chiefly by containing olivine. Usually of small extent, they occur as more basic masses within areas of gabbro (q.v.) and norite. By processes of weathering, of which evidence is rarely lacking in specimens, peridotites alter to serpentine (q.v.); most of the larger bodies of the latter rock have been derived from peridotites.

PÉRIER, pâ'ryá', CASIMIR (1777-1832). A French statesman, born at Grenoble, Department of Isère, Oct. 21, 1777. He was educated at the College of the Oratory at Lyons, and served in the Army of Italy during the campaigns of 1798-1800. Returning to Paris, he helped his father and brother to found a banking house, which soon had a large and prosperous business. In 1817, as the result of an attack on the financial policy of the government, Casimir Périer was chosen as one of the Deputies from Paris, and being repeatedly reelected, he became one of the leading members of the Opposition under Charles X. In 1828 he was Minister of Commerce and Finance under Martignac. After the overthrow of the Bourbon monarchy by the revolution of July, 1830, Périer became a member of the new government and acted as Prime Minister to Louis Philippe from March 13, 1831, until his death, May 16, 1832. During his tenure of office he repressed Republican outbreaks at Paris and at Lyons and the Legitimist movement in the South. He also directed the foreign policy of France against Austria with sagacity and ability, and sustained ministerial responsibility against the King and in the Chamber of Deputies. In his efforts to control the cholera epidemic of 1832 he became infected with the disease and rapidly succumbed. The most prominent disciple of his constitutional policy of *juste milieu* was Guizot, who has given a picture of his predecessor in his *Mémoires*. Périer's son, Auguste, adopted the name of Casimir-Périer (q.v.).

PÉRIERS, pâ'ryá', JEAN BONAVENTURE DES (c.1500-44). A French poet and philosopher, born at Arnay-le-Duc, Bourgogne. His known literary work began in 1534 with collaboration in the first French translation of the Bible, and

two years afterward he assisted Dolet in his *Commentaires de la langue latine*. He entered into the service of Marguerite, Queen of Navarre (1536), but in the following year fell out of favor with her on the publication of his *Cymbalum Mundi*, a collection of allegorical dialogues, wherein man's philosophy and religion are ridiculed. The book, denounced by Catholic and Protestant alike, was publicly burned, its author ostracized, and it is supposed that he committed suicide. His friends published *Œuvres diverses* (1544) and the *Nouvelles récréations et joyeux devis* (1558). A later edition of his works was published in Paris (1866) and a special one of the *Cymbalum* in 1874.

PERIGEE, pĕr'i-jĕ (from Gk. *περί, peri*, around + *γῆ, gē*, earth). That point in the moon's orbit which is nearest to the earth. The opposite point is the apogee (q.v.). See MOON.

PÉRIGORD, pâ'rĕ'gôr'. A former county of France, forming a part of the Province of Guienne (q.v.), and now included within the Departments of Dordogne and Lot-et-Garonne. It was divided into Upper and Lower Périgord, and the principal town was Périgueux. It was the land of the ancient Petrocorii; was overrun by the Franks in the beginning of the sixth century, and with the rest of Guienne came into the possession of England by the marriage of Henry II and Eleanor of Aquitaine. In 1454 it was acquired by the house of Albret, and upon the accession of Henry IV in 1589 was united to France.

PÉRIGORD, CHARLES MAURICE, DUKE DE TALLEYRAND-. See TALLEYRAND-PÉRIGORD, C. M., DUKE DE

PÉRIGUEUX, pâ'rĕ'gô'. The capital of the Department of Dordogne, France, on the Isle, 79 miles east-northeast of Bordeaux (Map: France, S. E 3). It consists of the ancient cité of Périgueux, along the river bank—gloomy of aspect, with narrow streets, but large and solidly built houses—the Puy Saint-Front on rising ground, which until 1240 was a separate town, and the new town. In the old town there are many curious remains of ancient and mediæval architecture, including a château of the fourth century. The ramparts have been demolished and replaced by boulevards. The cathedral of Saint-Front, dating from 1120, a majestic edifice of Byzantine design in the form of a Greek cross, with five domes, externally reconstructed since 1865, resembles St Mark's at Venice. Other interesting features are the former cathedral of Saint-Etienne, the remains of a sixth-century basilica, and the ruins of a vast Roman amphitheatre, of ancient aqueducts, baths, temples, and the remarkable Tour de Vésone. The city has a museum of antiquities, a library with 35,000 volumes, a botanical garden, and a handsome seminary. Quarries of building stone are worked in the vicinity, and many hands are employed in cutting and polishing marble. Paper, woolen cloths, silk, cutlery, hats, furniture, agricultural machinery, tools, and tobacco are manufactured and there is a trade in wine, grain, swine, and oxen. The celebrated pâtés de Périgueux, made of partridges and truffles, are largely made and exported. Pop., 1901, 31,976. 1911, 33,548. Périgueux, the Vesunna and capital of the Petrocorii, mentioned by Caesar, was a city of much importance in ancient times. See PÉRIGORD.

PERIGYNY, pĕr-ij'i-nĭ (from Gk. *περί, peri*, around + *γυνή, gynē*, woman, pistil). A condition in flowers in which the sepals, petals, and stamens are borne upon the margin of a cuplike outgrowth around the pistil, as is well shown in the flower of the common cherry. In most flowers the different sets of members arise independently (hypogyny, q.v.), but in perigyny zonal development occurs, involving the three outer sets. The different sets start independently, but sooner or later a common growth of all their zones occurs, resulting in an urnlike structure bearing the distinct members at its rim and inclosing the carpels. Epigyny (q.v.) is a floral condition in which all four floral sets have a common zonal development, resulting in the so-called inferior ovary. Perigynous flowers are specially characteristic of certain genera of the rose family. See FLOWER; HYPOGYNY; PERIGYNY.

PERIHELION (Neo-Lat., from Gk. *περί, peri*, around + *ἥλιος, hēlios*, sun) That point in its orbit at which a planet is nearest the sun. The point of the orbit opposite to it is called the aphelion (q.v.). The position of the perihelion, i.e., its longitude east or west of the vernal equinox, is one of the seven elements of a planet's orbit. See ELEMENTS; ORBIT.

PERIM, pā-rēm' A small island in the Red Sea about 2 miles from the southwest coast of Arabia, in the Strait of Bah-el-Mandeb (Map: Asia, F 7). Area, about 7 square miles. It is under British control, being annexed in view of increasing importance of the Red Sea, is used as a coaling and supply station, and has a small garrison and a lighthouse. Pop., about 200.

PERIMETER (Lat. *perimetros*, from Gk. *περίμετρος*, circumference, from *περί, peri*, around + *μέτρον, metron*, measure). The length of the boundary of a plane figure. In the case of curvilinear figures, and particularly of circles, the word circumference is generally used instead of perimeter. See ISOPERIMETRIC FIGURES.

PERINÆUM (Neo-Lat., from Lat. *perinaeum*, *perineum*, from Gk. *περίναιον, perinaion*, *περίνεον, perineon*, *περινός, perinos*, perineum). The part of the human body which forms the floor of the true pelvis is by anatomists divided into two portions. Of these the anterior one, situated in front of the anus, is called the true perinaeum, or urethral (or, in the female, the vaginal) portion of the perinaeum, the posterior portion, which contains the anus or termination of the rectum, is called the rectal or anal portion of the perinaeum. The anterior portion, or true perinaeum, is triangular in form, the apex being in front; the sides, about 3 inches in length, are formed by the rami of the pubes and ischium (see PELVIS), and the base by an imaginary line joining the tuberosities of the ischium and passing about ½ inch in front of the anus. Through this space the urethra passes through a layer of strong fascia—the deep perineal fascia—to communicate with the bladder, and in this space the opening is made in the operation of lithotomy.

In the female the space usually referred to as the perinaeum lies between the vagina in front and the anal orifice behind. Its most important constituent is the anterior portion of the levator ani muscle. The perinaeum, including a greater or less extent of this muscle and sometimes also the sphincter ani muscle, is often torn during parturition, and requires suturing for its repair.

PERIOD (Lat. *periodus*, from Gk. *περίοδος*, a going round, circumference, circuit, cycle, sen-

tence, period, from *περί, peri*, around + *ὁδός, hodos*, road). A term used in chronology in the same sense as cycle, to denote an interval of time after which the astronomical phenomena to which it refers recur in the same order. It is also employed to signify a cycle of cycles.

The Chaldeans invented the *Chaldaic period* or *Saros*, from observing that, after a certain number of revolutions of the moon round the earth, her eclipses recurred in the same order and of the same magnitude. This period consists of 223 lunations, or 6585.32 days, and corresponds almost exactly to 19 "eclipse years." The eclipse year is the time required for the sun, in his apparent motion among the stars, to complete a circuit from one of the nodes (see NODE) of the lunar orbit back again to the same node. On account of the motion of the lunar nodes, the eclipse year contains only 346.62 days, and 19 such years contain 6585.78 days. The error of the *Saros* is thus only 0.46 day (about 11 hours) in 223 lunations, or 19 eclipse years.

Various important periods or cycles are used in the calendar (q.v.) for predicting the dates of new and full moon. These phases recur on the same dates every 19 years (except that leap years may change the dates one day), which fact was discovered by Meton, an Athenian, who invented (432 B.C.) a lunar period of 6940 days, or 19 years, called the *Metonic cycle* (q.v.), also the *lunar cycle*. The *calypic period* consists of 76 years, or four Metonic periods, and is thus able to take account of leap years. The period of the *lunar* or *solar cycle*, after which the same day of the month falls upon the same day of the week, consists of 28 Julian years of 365¼ days each. If the year had regularly consisted of 365 days—i.e., one day more than an exact number of weeks—it is evident that at the end of seven years the days of the month and week would again correspond; but the introduction of an intercalary day into every fourth year causes this coincidence to recur at irregular periods. (To ascertain when the same days of the week and month will recur in the Gregorian calendar, see CALENDAR, *Perpetual Calendar*.) The *Julian period* is a cycle of cycles and consists of 7980 (28·19·15) years, after the lapse of which the solar cycle, lunar cycle, and the indiction (q.v.) commence together. The time of its commencement was arranged so that it will expire at the same time as the other three periods from which it is derived. The year 4713 B.C. is taken as the first year of the period, consequently 1 A.D. is the 4714th year of it. (See CHRONOLOGY; CALENDAR, CYCLE.) Astronomers also use the term "period" to designate the time required by a planet or other celestial body to complete a revolution in its orbit. (See ELEMENTS.) In this sense there may be different periods for the same body, according to the point selected as the beginning and end of the periodic orbital motion. The location of the position from which the motion is supposed to be viewed may also change the period materially.

PERIODIC ACID. See IODINE.

PERIODICAL. In a wide sense, a publication issued, at more or less regular intervals, in successive numbers, which are not related to one another as volumes or parts of a single book or series of books. The word, however, is commonly employed—and is here considered—in a narrower sense which excludes on the one hand newspapers (see NEWSPAPER), or periodical summaries of current and especially of political

events, and on the other such periodical publications as the transactions of learned societies, yearbooks, almanacs, and so on. Even within these limits the term includes a great variety of publications which differ so much in object and character that concise description of them is impossible, but it may be said of them in general that they are designed to furnish either information about matters of more than ephemeral interest or entertainment, or both. They deal either with a single subject—such as literature, or a particular science or industry—or with a group of allied subjects, or with material of the most heterogeneous character. The most important special groups of them are *revues*, or periodicals devoted especially to the criticism of books, and *magazines*, which are designed to furnish miscellaneous and entertaining reading. In the most popular of the latter class fiction forms an important part of the contents, and pictorial illustrations, often of fine artistic quality, are frequently employed.

Early Forms. The periodical, as thus defined, originated in France in the seventeenth century and in the form of the critical literary journal. The first suggestion for it may perhaps be found in Théophraste Renaudot's *Bureau d'Adresse* (1633-42), which was no more than an account of his conferences concerned with literature and science, but the first real example of it was the *Journal des Savants*, which turned out to be one of the most famous and longest lived, for its publication has continued, though with many interruptions, until the present day. The idea which it embodied was conceived about 1663 by the historian Mezeray, who proposed to establish a weekly journal in which should be "made known what was happening in the republic of letters." His project came to nothing, but in 1664 Denis de Sallo, Sieur de la Coudraye, under the name of Sieur de Hédouville, obtained the privilege of issuing a periodical of this kind, and the first number of the *Journal des Savants* appeared on Jan. 5, 1665. Its plan included reviews of new books, reports of scientific discoveries, obituary notices, and general information of interest to the learned world. Sallo associated with himself a number of scholars, among them the Abbé Gallois, who succeeded him as editor. The freedom—or, as it appeared to an age not accustomed to the ways of the reviewer, arrogance—with which the new journal criticized both books and (what was more serious) ecclesiastical affairs promptly brought it into trouble, and after the appearance of the thirteenth number it was suppressed. Colbert, however, who recognized its value, decided to reestablish it, and, on Sallo's refusal to consent to the demanded abridgment of his freedom, placed it (1666) in the hands of the Abbé Gallois, who conducted it negligently, issued it very irregularly, and practically abandoned it in 1674. In 1675 publication was resumed under the editorship of the Abbé de la Roque, who was succeeded in 1687 by L. Cousin. In 1701 it was acquired for the state and passed under the editorial control of a commission of literary men and was conducted in this way until 1723. After a year of suspended animation it was reissued under the auspices of the Abbé Bignon and the Abbé Desfontaines. Another interruption of publication was caused by the Revolution in 1792, and an attempt to revive it in 1796 was a failure. It was finally reestablished (April 15, 1816) under the Restoration and placed under

the supervision of a commission representing the different classes of the Institute. In 1857 its control was put in the hands of the Minister of Public Instruction. The subsidy which had long been granted it by the state was withdrawn in 1903, and the Institute allowed 10,000 francs annually for its maintenance and nominated a commission of five members to control it. After 1909 the Académie des Inscriptions et Belles Lettres directed the *Journal*, which still received its 10,000 francs a year. It now accepts contributions concerned almost exclusively with antiquities, mediæval subjects, and Oriental subjects. Seven years after the appearance of the *Journal des Savants* was founded the second French literary, or partly literary, periodical, the *Mercurie Galant* of Jean Donneau de Vizé, which under a variety of titles continued, with interruptions, to exist until 1825, in 1717 it received the name of *Mercur de France*, by which it is commonly known. In addition to criticism, poetry, and other literary material, it dealt with topics of the most diverse kinds, including current news, and it has accordingly a place in the history of journalism. Among its editors were Thomas Corneille, whom Vizé associated with himself, and Marmontel. In the same year (1672) with the founding of the *Mercurie Galant* Claude Blondeau and Gabriel Guéret began the first legal periodical, the *Journal du Palais*, in 1679 appeared the *Nouvelles découvertes sur toutes les parties de la médecine* (3 vols.) of Nicholas de Blegny—memoirs published by an "academy" at whose head Blegny had placed himself—which may be regarded as the first medical journal, and in 1680 was issued by the Abbé Jean-Paul de la Roque the first prospectus of a religious periodical—the *Journal Ecclésiastique*. The publication of the last named was forbidden, and in 1690 La Roque began the *Mémoires sur l'histoire ecclésiastique*, of which however, only one volume was issued. A medical journal—*Les Journaux de Médecine, etc.*—which he started in 1683 was equally unfortunate. Other notable periodicals of French origin (but printed in Holland) dating from the seventeenth century are the *Nouvelles de la République des Lettres*, founded by the celebrated Pierre Bayle in 1684, and conducted by him for three years (it survived until 1718) the *Histoire des Ouvrages des Savants* of Henri Basnage de Beauval, begun in 1687 and continued until the middle of 1709, and the *Bibliothèque Universelle et Historique* of Jean Leclerc, the noted critic, which was issued in 1686-93.

Beginnings in England. The last quarter of the same century saw the beginnings of the literary and of the scientific periodical in England also. As the first example of the former is commonly reckoned the *Mercurius Librarius, or a Faithful Account of All Books and Pamphlets*, the first number of which appeared in April, 1680. It was announced as a "catalogue" to be published "weekly, or one in fourteen days at least," and it was in fact nothing more, it contained advertisements, or paid notices of new books, and possessed nothing of the literary character. Of greater importance was the *Weekly Memorials for the Ingenious*, issued 1681-83, which obtained much of its material from the *Journal des Savants*. Between 1685 and 1700 appeared for brief periods several learned publications of the periodical type, derived chiefly from continental sources. Of a more

strictly English character was the *Athenian Gazette* (later called the *Athenian Mercury*)—a kind of "Notes and Queries"—published weekly from March, 1689–90, to February, 1695–96, by the bookseller John Dunton, with the assistance of Richard Sault and others. The *Gentleman's Journal*, or the *Monthly Miscellany*, of Peter Anthony Motteux, a forerunner of the modern literary magazine, was issued 1692–93 (2 vols.); it contained verses by Prior, Sedley, Mrs. Behn, Oldmixon, D'Urfey, and others, and miscellaneous prose. The *History of the Works of the Learned*, a review dealing mainly with continental books, was issued from 1699 to 1712. Its publication was resumed in 1737 and was continued until 1743.

Early German Periodicals. In Germany a beginning was made in 1663 with the *Erbauliche Monatsunterredungen* of Johann Rist, which was followed in 1670 by the first scientific annual, the *Miscellanea Curiosa Medico-Physica* of the Academia Leopoldina-Carolina. But the most celebrated of all the periodicals which date from this period is the first German literary journal, the *Acta Eruditorum Lipsensium* (written in Latin), founded by Prof. Otto Mencke in Leipzig, the first number of which appeared in 1682. It was modeled after the *Journal des Savants* and the Italian *Giornale de' Letterati* (see below), and included extracts from, and analyses of, new books, reviews, and independent articles. Mencke associated with himself in this work many of the most learned men of the time, among them Leibnitz, Seckendorff, and Thomasius, and the *Acta* became the supreme critical authority in German literature. On Mencke's death, in 1707, he was succeeded in the editorship by his son, J. B. Mencke; and in 1732 his grandson, F. O. Mencke, began a new series under the title *Nova Acta Eruditorum*.

Outside of the countries above mentioned, Italy alone has possessed learned periodicals dating from this period—the *Giornale de' Letterati* of Francesco Nazzari, founded in 1668 and published until 1679, another with a similar title issued from 1686 to 1697 by Bacchini and Roberti, and the *Biblioteca volante* of Cinelli and Sancassini (1676–1718 and 1733–47).

Modern British Periodicals. From the beginning of the eighteenth century new periodicals have appeared in these and in other countries in ever increasing numbers and diversity. In England Daniel Defoe began in 1704 *A Review of the Affairs of France and of All Europe, as Influenced by that Nation*, issued at first weekly, then twice, and later thrice a week. It came to an end, in its original form, in 1712, but was carried on in a new series, called simply the *Review*, until June, 1713. One feature of this review—the contributions of an imaginary "Scandal Club"—doubtless suggested the periodical essay which became important in the history of English literature. Of these essay periodicals the most noted are the *Tatler* (1709–10–11), written chiefly by Steele and Addison; the *Spectator* (1710–14) of Addison, Steele, Budgell, and others; the *Rambler* (1750–52) of Dr. Johnson. A French Protestant refugee, Michel de la Roche, a friend of Bayle, started in 1710 the *Memoirs of Literature*, a review, independent of foreign sources for its material, though modeled after French works of the kind, which he issued until the end of 1714. In 1725 he began another review, the *Nec Memoirs of Literature*, which lived for about two years, and

in 1730 *A Literary Journal*, a continuation of the *Memoirs of Literature*, which came to an end in about half that time. A classical periodical, entitled *Bibliotheca Literaria, Being a Collection of Inscriptions, Medals, Dissertations, etc.*, was brought out in 1722 by Samuel Jebb and ran through 10 numbers, ending in 1724. La Roche's work was taken up by Andrew Reid, who issued (1728–36) *The Present State of the Republick of Letters*, a review of considerable merit; and by Archibald Bower, whose *Historia Literaria* appeared monthly (1730–34). At this time (January, 1730–31) was published the first and one of the most famous of English magazines, the *Gentleman's Magazine, or Traders' Monthly Intelligencer . . . by Sylvanus Urban, Gent.*, founded by the printer Edward Cave. His original plan, afterward much widened, was that of a collection or "magazine" (the first use of the word in this sense) of the essays and news which appeared in the London papers: the title was in other points suggested by Motteux's periodical mentioned above. The magazine met with great success—due chiefly to Cave's energy and practical (not literary) ability—its circulation rising within a few years to over 10,000 copies. In it, in 1732, was begun the publication of parliamentary debates (of both Houses), under the (necessary) disguise of "Reports of the Debates of the Senate of Lilliput"; Johnson was employed during several years in writing out (largely from his own imagination) the speeches reported. After Cave's death, in 1754, it was conducted by his brother-in-law and later by John Nichols and his son. In 1868 it became a magazine of light literature. It soon had numerous imitators and rivals, the most successful of which was the *London Magazine* (1732–84), established by leading London publishers. Among the most important of the other magazines established during the eighteenth century are the *Scots Magazine* (1739–1817, from that date to 1826 the *Edinburgh Magazine*), the *Royal Magazine* (1759–71), the *Oxford Magazine* (1768–82), the *European Magazine* (1782–1826), the *Monthly Magazine* (1796–1843), and the *Philosophical Magazine* (established 1798). To return to reviews: the *History of the Works of the Learned* found a successor in *A Literary Journal* (Dublin, 1744–49), the first review published in Ireland. *The Muscum*, projected by the poet and bookseller Robert Dodsley, appeared in March, 1746, and was issued fortnightly until September, 1747. It was as much a magazine as a review, comprising, besides notices of books, essays, mainly upon historical and social topics, by writers of repute, including Spence, Warburton, Horace Walpole, Akenside, and Campbell. From this time on the distinctive characteristics of the modern literary review became more and more prominent and before the end of the century were firmly established.

A notable advance in this direction was made in the *Monthly Review*, founded by Ralph Griffiths (1749) and conducted by him until his death, in 1803. It included scientific and literary material as well as criticism, and among its writers (1757–58) was Oliver Goldsmith. The *Review* was carried on after Griffiths's death by his son (until 1825) and others until 1845. The Whig politics and nonconformity of Griffiths led to the founding of the *Tory Critical Review* (1756–1817) by Archibald Hamilton, to which Smollett, Johnson, and Robertson contributed;

and this was followed by a number of others, including the *London Review* (1775-80); *A New Review* (1782-86); the *English Review* (1783-96), combined in 1797 with the *Analytical Review* (1788-99); the *Antijacobin Review and Magazine* (1798-1821); and the *High Church British Critic* (1793-1843), begun by Nares and Beloe. An epoch in the history of the English review was made by the establishment of the *Edinburgh Review or Critical Journal*—"to be continued quarterly"—the first number of which appeared in October, 1802. It was designed to be the organ not only of literary but also of political (Whig) opinion, and was planned so broadly and edited so ably that it almost immediately attained a position of authority which soon became, as Carlyle said, that of "a kind of Delphic oracle and voice of the inspired for great majorities of what is called the 'intelligent public.'" The first of the really great English reviews, it established a standard of reviewing which (though its literary criticism, especially in the early days, has often been inferior) its rivals during the century and more of its existence have not been able to surpass. In it the English review became for the first time a really potent influence in the formation of literary taste and the shaping of political views. Its original projector was Sydney Smith, and he also edited the first number, with the second the editorship was transferred to Francis Jeffrey (later Lord Jeffrey), who retained it until 1829, when he resigned on his election as dean of the faculty of advocates. Among the other earlier contributors were Brougham, who largely determined its political opinions, Scott (during the first few years), Carlyle, Hazlitt, and (from 1825) Macaulay, whose influence upon its character was probably second only to that of Jeffrey. After Jeffrey's retirement the editorship was held successively by Macvey Napier (1829-47), William Empson (-1852), George Cornewall Lewis (-1855), Henry Reeve (-1895), and Arthur S. Elliot (1895-). In 1902 the *Review* celebrated its centennial.

The great success and rapidly growing influence of this champion of Whiggism caused the Tories to bestir themselves, and in February, 1809, appeared the first number of the *Quarterly Review*, which soon attained a position hardly second to that of its great rival. Its first editor was William Gifford, and among its first contributors were Scott, Southey, Dr. Young, Canning, John Wilson Croker, and Heber. Gifford resigned in 1824 and was succeeded by John Taylor Coleridge, who gave place in 1826 to John Gibson Lockhart, who retained the editorial control of the *Review* until 1853, he was followed by the Rev. Whitwell Elwin (-1860), William Macpherson (-1867), Sir William Smith (-1893), Rowland Prothero (1894-99), and George W. Prothero (1899-). The *Westminster Review* (styled from 1836, when it was combined with the *London Review*, until 1851 the *London and Westminster Review*) was founded in 1824 to promulgate the views of the Utilitarians, Bentham and the Mills. The great quarrelles above mentioned were partisan in their origin and in their principles of editorial management; they were designed to promulgate definite views, literary and political, with which the opinions of their contributors must be in harmony; their articles were accordingly anonymous. This policy was abandoned by the *Fortnightly Review*, established in 1865 (issued

monthly from 1866), which was designed to allow the freest expression of individual opinion with individual responsibility. Its first editor was George Henry Lewes, who was followed in 1867 by John Morley, who resigned in 1882 and was, in turn, succeeded by T. H. S. Escott, Frank Harris, Oswald Crawford, and W. L. Courtney. Among its early supporters were Bagehot, George Eliot, Mill, Huxley, and Spencer. The policy of the *Fortnightly* has been followed by the *Contemporary Review*, established in 1866, the *Nineteenth Century* in 1877 (since 1900 *The Nineteenth Century and After*), and the *National Review* in 1883. A notable periodical also is the *English Review* (1908-), which took the name of a periodical that died more than a century before the founding of its later namesake.

Among weekly journals dealing wholly or partly with literature, science, and art are the *Examiner* (1808-81), the *Literary Gazette* (1817-62), the *Athenaeum* (1828-), the *Spectator* (1828-), the *Saturday Review* (1855-), the *Academy* (1869-), and the *Speaker* (1890-). The humorous weekly *Punch*, the most famous journal of its kind, was founded in 1841. Many notable English writers and artists have contributed to it.

Hardly less notable than the development of the review during the nineteenth century was that of the magazine. The *New Monthly Magazine* (1814) numbered Campbell, Theodore Hook, and Bulwer Lytton among its editors. A brilliant production was *Blackwood's Edinburgh Magazine* (1817-), which "created a sensation unparalleled in magazine history," due to the wit and audacity of its anonymous contributors, among whom were Lockhart, Hogg, Scott, and John Wilson the editor. Its most important feature, in those early days, was the famous *Noctes Ambrosianae*, "in which the leading contributors discoursed with irresponsible wit and incisiveness upon the books, the people, and the events of importance in their day." *Fraser's Magazine* (1830-82, when it became *Longman's Magazine*) is associated with the names of Carlyle and Thackeray. Others of note are the *British Magazine* (1832-49), the *Dublin University Magazine* (1833-), *Tait's Edinburgh Magazine* (1832-61), *Bentley's Miscellany* (1837-68), *Notes and Queries* (1849-), *Macmillan's Magazine* (1859-), the *Cornhill Magazine* (1860-), *St. James's Magazine* (1861-), the *English Illustrated Magazine* (1883-), *Cassell's Magazine* (1877-), *Temple Bar* (1860-1906), *Review of Reviews* (1890-), the *Strand Magazine* (1891), the *Pall Mall Magazine* (1893-), the *Studio* (1893-), the *Connoisseur* (1901-), and the *Burlington* (1903-). These are only a selection from a long list.

United States. In speaking heretofore of periodicals only typical publications have been cited, and henceforth—and this is especially true of the period from the middle of the nineteenth century to the present—the same method must be followed. Even with this limitation of the field a choice of representative examples is embarrassing and likely to be criticized as arbitrary, especially as no attempt will be made to consider technical publications or publications of a very special or, so to speak, professional appeal, despite the fact that a number of such frequently find their way, directly or by citations, into the hands of the general public. The history of the periodical in the United States be-

gins in Colonial times with the *American Magazine*, issued at Philadelphia, Feb. 13, 1741, by the printer Andrew Bradford, a business rival of Franklin's, and edited by John Webbe. The idea was due to Franklin, who had planned an imitation of the *Gentleman's Magazine* and had incautiously divulged his scheme to Webbe. Franklin's own periodical, the *General Magazine*, was issued on Feb. 16, 1741, its projector thus losing by three days the honor of having edited and published the first monthly in America. Both publications were short-lived, Webbe's perishing with its second number and Franklin's with its sixth. Throughout the entire subsequent development of periodical literature in this country the magazine has taken the first place, reviews having been comparatively few in number and, in general, decidedly inferior in quality. The magazines published down to the Revolution number 16. Among them were the *American Magazine and Historical Chronicle* (Boston, 1743-46), the *Boston Weekly Magazine* (1743-), the *Christian History* (Boston, 1743-44), the *Independent Reflector* (New York, 1752-53), the *New England Magazine of Knowledge and Pleasure* (Boston, 1758-60), the *American Magazine and Monthly Chronicle* (Philadelphia, 1757-58), the *New American Magazine* (Woodbridge, N. J., 1758-60), the *American Magazine* (Philadelphia, 1769), the *Royal American Magazine* (Boston, 1774-75), and the *Pennsylvania Magazine, or American Monthly Museum* (1775-76). Between the close of the war and the end of the century about 40 others appeared, among them the *Columbian Magazine, or Monthly Miscellany* (Philadelphia, 1786-92; from March, 1790, entitled the *Universal Asylum and Columbian Magazine*); the *American Museum, or Repository* (1787-92), of considerable value as a source of historical information; the *Massachusetts Magazine* (Boston, 1789-96); the *New York Magazine* (1790-97), the *Political Censor, or Monthly Review* (Philadelphia, 1796-97), edited by William Cobbett, the *Farmer's Weekly Museum* (Walpole, N. H., 1790-99). The last was edited from 1795 by Joseph Dennie, the founder, in 1801, of the *Portfolio*. Charles Brockden Brown established in 1799, in New York, the *Monthly Magazine and American Review*, which, with a change of name to the *American Review and Literary Journal*, survived until 1802. He later edited the *Literary Magazine and American Register* (Philadelphia, 1803-08).

At the end of the first decade of the nineteenth century the periodicals published in the United States amounted to nearly 30 in number. Only two of them, however, were in any way notable: the *Portfolio* (Philadelphia), above mentioned, which survived until 1827—up to that time a phenomenally long life for an American magazine; and the *Anthology and Boston Review* (Boston, 1803-11), which included Ticknor, John Quincy Adams, and Everett among its contributors. From this time on the number of literary periodicals, to say nothing of religious and other special publications, increased rapidly, with a corresponding improvement in quality. The following are perhaps the most noteworthy: the *Analectic Magazine* (Philadelphia, 1813-20), founded by Moses Thomas, with Irving (its editor, 1813-14), Paulding, and Wilson the ornithologist among its contributors; the *Atlantic Magazine* (New York, 1824-25; continued until 1827 as the

New York Monthly Review), which was edited by Robert C. Sands and had the support of Bryant; the *New York Mirror* (1823-42), of which N. P. Willis was one of the editors; the *Illinois Monthly Magazine* (Vandalia, 1830-32), the first publication of the kind in the West; the *American Monthly Magazine* (New York, 1833-38), edited 1837-38 by Park Benjamin; *Graham's Magazine* (1840-50), a widely and deservedly popular periodical; the *Dial* (Boston, 1840-44), the organ of the New England Transcendentalists, edited by Ripley and Margaret Fuller and then by Emerson; the *International Magazine* (New York, 1850-52), edited by R. W. Griswold, the *Knickerbocker Magazine* (New York, 1833-60), founded by the novelist Charles Fenno Hoffman and edited for some time by Louis Gaylord Clark; *Putnam's Monthly Magazine* (New York, 1853-57, 1867-69; revived in 1906, when it absorbed the *Critic*, only to be itself absorbed by the *Atlantic Monthly* some two or three years later; the *Atlantic Monthly* (Boston, 1857-), perhaps the foremost of American periodicals from a literary point of view, having had as editors Lowell, Fields, Howells, Aldrich, Scudder, Page, Perry, and Sedgwick, and among its contributors Holmes, Longfellow, Whittier, and most of the notable American men of letters; *Harper's Magazine* (New York, 1850), an illustrated monthly; *Scribner's Monthly* (New York), an illustrated monthly founded in 1870 by Dr. J. G. Holland (as editor), Roswell Smith, and Charles Scribner, and from 1881 published, with R. W. Gilder as its first editor, as the *Century Magazine*; the *Galaxy*, incorporated with the *Atlantic Monthly* in 1878 (New York, 1866-), *Lippincott's Magazine* (Philadelphia, 1868-1914; New York, 1914, but with name changed to *McBride's Magazine* in 1915); *Scribner's Magazine*, illustrated (New York, 1887-); the *New England Magazine*, illustrated (1889-); the *Cosmopolitan*, illustrated (New York, 1886-), and *Hearst's Magazine* (New York, 1901), both with immense popular circulations; the *Review of Reviews*, illustrated (1890-); *McClure's Magazine*, illustrated (New York, 1893-), the *Bookman*, illustrated (1895-); *American Magazine*, illustrated (1906-); the *World's Work*, illustrated (1902-). In the periodicals, beginning with the *Atlantic*, the popular literary magazine has reached its highest point of development. Especially important has been the impetus given to developing the art of illustration, and the support given to the obsolescent art of wood engraving by the *Century* and *Harper's*.

The character of the American magazine was vitally changed, first by the new development of the *North American Review* on its purchase by Allen Thorndike Rice in 1877, when it had 1700 circulation. He changed it from a quarterly into a monthly, broke away from its literary traditions, and filled it with articles selected for their timely interest and in part for the popularity or notoriety of those who wrote them. Two results followed. Circulation greatly increased, but it was based on news-stand sales and not on subscriptions. Advertising was stimulated, but its rate came to rest on the size of circulation rather than on its quality. Under these twin influences a magazine to be successful was forced to make each number measurably popular in order to attract circulation, and the magazine which failed to secure this could not get advertising and found its profits diminish-

ing and in many instances disappearing. This tendency was quickened by the appearance of the 10-cent magazine towards the close of the nineteenth century—*Munsey's Magazine* (1889—) being the pioneer, and a very successful one, in this field. During the decade of 1905–15 these changes evolved the characteristic latter-day American magazine—a publication devoted to fiction, profusely illustrated, and reaching an unprecedented circulation of 500,000 to 1,400,000. Prosperous as such magazines were, the fluctuations in their circulation and advertising were great, and a new school of fiction, highly paid, developed by them, greatly increased the income of the successful writer without adding to literature. The literary magazine came to have a relatively small circulation and to reach an audience small as compared to the great population of readers.

C. H. K. Curtis (q.v.), by starting the *Ladies' Home Journal* (Philadelphia, 1883), created a new audience by a magazine with a large folio page, covering all phases of domestic life, occupying itself with domestic morals, and opening a new chapter in the history of advertising by printing reading matter and advertisements on the same page. A circulation before unknown, running above 2,000,000 and maintained for years, led to a host of imitators, some of which approached these figures. The changes noted have had a profound influence on daily newspapers by diverting from them advertising they once had. Magazine contributors have been sharply divided between the small class contributing to the literary magazines and producing works of some literary quality, and a far larger number contributing more ephemeral matter to monthlies and weeklies of phenomenal circulation.

Of American reviews less need be said. Although some of these are excellent, they do not, as a whole, compare favorably with those that have been published in England and on the Continent. Their history begins with the *American Review of History and Politics* (Philadelphia, 1811–13), a quarterly founded by Robert Walsh. This was soon followed by the *North American Review* (Boston, 1815, and subsequently in New York), of which something has just been said in connection with the development of American magazines, and which has continued until the present day. Among its editors have been many eminent men—A. P. Peabody, H. Adams, Dana, Edward Everett, Sparks, Bowen, Lowell, Norton, and George Harvey (consult the centennial numbers of 1915). Among later publications of the kind, overlooking those that were merely ephemeral, are the *Southern Quarterly Review*, first published 1828–32 (Charleston, revived, 1842–55); the *United States Magazine and Democratic Review* (New York, 1837–52, later the *United States Review*, 1853–55); the *New Englander* (New Haven, 1843–92); the *International Review* (New York, 1874–83); the *Forum* (1886–); the *Arena* (1890–1909; in 1910 merged with *Christian Work*); the *Yale Review* (1892–). Of American periodicals appearing oftener than once a month are several which divide their space among various departments—affairs, the arts, literature. Some of these are mentioned in the article *NEWSPAPER*, but several should be noted here as well—the *Nation* (weekly, New York, from 1865; consult the semicentennial number, July 8, 1915); the *Chicago Dial* (fortnightly, 1881–); and the *New*

Republic (New York, 1914–). For statistics of periodicals published in the United States, see table under *NEWSPAPER*.

Modern French Periodicals. In France the periodicals originating in the eighteenth century begin with *Mémoires pour servir à l'histoire des sciences et des arts* (1701–67), founded by the Jesuits Michel le Tellier and Philippe Lalleman at Trévoux (whence it is known as the *Journal de Trévoux*); it gained a high and well-deserved reputation as a critical authority. In 1703 Jean Leclerc began, in continuation of his *Bibliothèque Universelle et Historique* (see above), a review entitled *Bibliothèque Choisie*, which was issued until 1713 and was followed by his *Bibliothèque Ancienne et Moderne* (1714–27). These, as well as various other periodicals edited by Frenchmen in this period, were printed in Holland. Among them are to be noted reviews of particular foreign literatures, as the *Bibliothèque Anglaise* (1717), and the *Mémoires littéraires de la Grande Bretagne* (1720–24) of Michel de la Roche (see above), and the *Bibliothèque Germanique* (1720–40) of Jacques Lenfant. About this time the English periodical essay found imitators in France; Marivaux published in 1722 the *Spectateur Français*, which was followed by a number of other publications of a similar character. Other literary journals were the *Mémoires secrets de la république des lettres* (1744–48), the *Observations sur les écrits modernes* (1735–43) of Desfontaines; the *Lettres sur quelques écrits de ce temps* (1749–54) and *L'Année Littéraire* (1754–90) of Fréron, and the *Observations sur la littérature moderne* (1749–52) and *L'Observateur Littéraire* (1758–61) of the Abbé de la Porte. In 1754 a review, the *Journal Etranger*, designed to deal with foreign literature in general, was founded by Fréron, Grimm, Prévost, and others; it ceased to appear in 1762. This was followed by the *Gazette Littéraire* (1764–66), in the editing of which Voltaire and Diderot had a hand. The *Mémoires secrets pour servir à l'histoire de la république des lettres* (1762–87), also called *Mémoires de Bachaumont*, from its founder, are an important record of contemporary social and literary conditions, the same is true of the *Correspondance Littéraire Secrète* (1774–93). Of a more general character were the magazines *Décade Philosophique*, later the *Revue Philosophique* (1796–1807), of P. L. Ginguené, the most important French periodical of its time, and the *Magasin Encyclopédique*, founded in 1792 and continued from 1817 as the *Annales Encyclopédiques* and the *Revue Encyclopédique*, until 1832. During the second half of this century appeared a number of periodicals dealing with special subjects, such as agriculture, commerce, political economy, military and naval affairs, and so on. In the early part of the nineteenth century, under both the Empire and the Restoration, the periodical as well as the newspaper press was hampered by many restrictions, and but little progress was made. The *Revue Britannique* (1825–1901) was a serial publication, begun in this period, which lived on into the twentieth century. In 1828 Guizot, Rémusat, and others started the *Revue Française*, in imitation of the English reviews; it lived, however, only two years. In 1829 appeared the *Revue de Paris*, which was issued until 1846. The same year (1829) saw the founding of the *Revue des Deux Mondes*, by Ségur-Dupeyron and Mauroy; during 1830 it was not published, but

in 1831 it reappeared and ever since has maintained the high reputation which it at once attained. Pierre Leroux and George Sand started the *Revue Indépendante* in 1841; it ceased to appear in 1848. Among the later literary periodicals are the *Nouvelle Revue* (1879-); *Le Livre* (1880-); the *Revue de Paris* (1894-), which appears fortnightly; the *Grande Revue*; the *Revue Bleu*; the *Revue Latine* (1902-); and the *Revue Germanique* (1905-). In the second half of the nineteenth century periodicals in France increased astonishingly in number. In the last decade of that century not less than 1350 were published in Paris alone, while Parisian periodical publications in the first decade of the twentieth century numbered some 3500.

Modern German Periodicals. In Germany, since the beginning of the eighteenth century, development has been mainly in the direction of the learned and, especially in recent times, of the scientific periodical. An extraordinary number of these have been published, many of them of great value. Literature, however, has also been well represented. Only a few of these journals can be mentioned. One of the earliest and most important was the *Neue Zeitungen von gelehrten Sachen*, founded by J. G. Krause in 1715 and carried on until 1797. It was the first attempt to apply the form of the weekly political journal to learned subjects. Still more notable is the *Göttingische gelehrte Anzeigen*, founded in 1739 as the *Zeitungen von gelehrten Sachen*, and conducted from that time until the present day by members of the faculty of the University of Göttingen, among whom have been Haller, Heyne, and Eichhorn. In 1766 the publisher Nicolai founded the *Allgemeine deutsche Bibliothek*, which was issued until 1806. Lessing and Mendelssohn aided in conducting the *Briefe die neueste Litteratur betreffend* (1759-65), also founded by Nicolai. Wieland founded *Der deutsche Merkur* (1773-89; revived, 1790-1810). The *Allgemeine Litteraturzeitung*, established by Bertuch in 1785 and issued until 1848, was one of the most important of German literary periodicals; the same may be said of the *Jenaische allgemeine Litteraturzeitung* (1804-48), founded by Eichstädt. The *Wiener Jahrbücher der Litteratur* (1818-48) enjoyed a high reputation, as did, for its learning, *Hermes* (1819-31), founded by W. T. Krug. The *Jahrbücher für wissenschaftliche Kritik* (1827-46), published by Cotta, and the *Heidelberger Jahrbücher der Litteratur* (1808-72) should also be mentioned. Of more recent date are the *Deutsche Vierteljahrsschrift* (1838-70); *Illustrierte Zeitung* (1843-); *Literarisches Zentralblatt* (1850-); *Westermanns illustrierte deutsche Monatshefte* (1850-); *Unsere Zeit* (1857-91); *Preussische Jahrbücher* (1858-); *Ueber Land und Meer* (1858-); *Die Gegenwart* (1872-); *Die Neue Zeit* (1872-); *Die Litteraturzeitung* (1874-); *Deutsche Rundschau* (1874-); *Nord und Süd* (1878-); *Velhagen und Klasing's Monatshefte* (1886-); *Die Nation* (1888-); *Zukunft* (1892-); *Berliner Illustrierte Zeitung* (1892-); *Das literarische Echo* (1899-); *Die Woche* (1899-), said to have had a circulation reaching 500,000; *Deutscher Monatsschrift* (1902-07); *Arena* (1906-); *Morgen* (1907-); *Unsere Zeit* (1907-); *Zenien* (1908-); *Das Neue Jahrhundert* (1909-); *Die Tat* (1909-).

Periodicals in Other Countries. The development in other European countries has been

similar, though less extensive. Italy, in which, as was stated above, the history of periodical literature dates back to the seventeenth century, exhibits a long list of notable literary journals. Among them are the *Frusta Letteraria* (1763-65) of Giuseppe Baretti; the *Novelle Letterarie* (1740-70) of Giovanni Lami; the *Biblioteca Italiana* (Milan, 1816-40); the *Progresso delle Scienze* (Naples, 1832-45); the *Rivista Contemporanea* (Turin, 1853-); the *Giornale degli Eruditi* (1883-); the *Rivista Internazionale* (1869-83); the *Giornale Storico della Letteratura Italiana* (1883-). Spain and Portugal, Belgium, Holland, the Scandinavian countries, Russia, Greece, and the Slavic countries, are all represented by literary periodicals of prominence.

In all the countries mentioned above, periodicals dealing with theology or the interests and practical work of the various religious denominations, with science, either in general or in one or more of its special branches, with the arts or trades, or with other special themes (including periodicals of humor), multiplied greatly during the nineteenth century. Their history cannot be given here even in the briefest summary.

Bibliography. British: Athanase Cuheval-Clarigny, *Histoire de la presse en Angleterre et dans les Etats-Unis* (Paris, 1857); Alexander Andrews, *History of British Journalism* (2 vols., London, 1859); R. R. Madden, *History of Irish Periodical Literature* (2 vols., ib., 1867); James Grant, *The Newspaper Press* (3 vols., ib., 1871-72); H. R. F. Bourne, *English Newspapers* (ib., 1887); J. B. Williams, *History of English Journalism to the Foundation of the Gazette* (ib., 1908); Hugh Walker, "Early Magazines of the Nineteenth Century," in *The English Essay and Essayists* (New York, 1915). Indexes to certain of the more important British periodicals are to be found in Poole's *Index*, the *Cumulative Index*, and the *Reader's Guide*—for all three of which see below. Lists of indexes are in *Lists of Books Forming the Reference Library* (British Museum) (London, 4th ed., 2 vols., 1910). For lists of current British periodicals, see Mitchell's *Newspaper Press Directory* and Street's *Newspaper Directory*.

United States: *Tenth Report of United States Census* (Washington, 1884), the statistics re periodicals; Athanase Cuheval-Clarigny, *Histoire de la presse*, etc. (above mentioned); Frederic Hudson, *Journalism in the United States* (New York, 1873); I. Thomas, *History of Printing in America* (Albany, 1874); H. M. Alden, *Magazine Writing and the New Literature* (New York, 1908). W. F. Poole, *Index to Periodical Literature* (1802-82) (rev. ed., Boston, 1891), containing an index to certain of the more important American and English magazines, which is continued through 1907 in a series of five-year supplements and is issued in an abridged edition, *Poole's Index* (Boston, 1901, with later supplements); *Cumulative Index . . . to Periodicals* (Cleveland, 1896 et seq.); *Reader's Guide to Periodical Literature* (Minneapolis, 1901-12; White Plains, N. Y., 1913 et seq.); F. W. Faxon, *Check List of American and English Periodicals* (Boston, 1908); Ayer and Son, *American Newspaper Directory* (Philadelphia, annually), which contains a list of current American periodicals and newspapers, with circulation of each and other data.

French: Eugène Hatin, *Histoire de la presse en France* (8 vols., Paris, 1859-61), *Les gazettes*

de Hollande et la presse clandestine aux 17^e et 18^e siècles (ib., 1865), and *Bibliographie de la presse périodique française* (ib., 1866); V. Gébé, *Catalogues des journaux* (ib., 1879); Brunet, *Manuel du libraire* (8 vols., ib., 1860-80). Some 350 periodicals are indexed in D. Jordell, *Répertoire bibliographique* (Paris, 3 vols., 1899-1900). See also *Annuaire de la presse française* (ib., 1909-10); *Annuaire des journaux, revues, etc.* (ib., 1910); and, for lists of indexes, Stein, *Manuel de bibliographie générale* (ib., 1897).

Germany: Access to periodical German literature is facilitated by the annual *résumés* of the various departments of science, art, and literature—the *Jahresberichte* and *Bibliographien*—which themselves might be regarded as a special kind of periodical. Examples of these are: *Jahresbericht über die Fortschritte der Chemie* (Giessen, 1847); *Bibliographie der Socialwissenschaften* (Dresden, 1905); *Bibliographia zoologica* (Leipzig, 1896); *Bibliographie für Volkswirtschaftslehre, etc.* (1906).

PERIODIC FUNCTION. See FUNCTION

PERIODICITY, IN VEGETATION. Periodicity refers to such phenomena as the flowering of plants at a particular season of the year, the alternation of foliated and leafless condition of forest trees, and any other regularly recurring phases of increased and decreased activity. In temperate and dry regions such alternations of growth activities are very prominent, the season of high temperature and greater rainfall being the period of greater vegetative activity. In tropical lands, with a uniformly warm and moist climate, periodicity is much less evident, and considerable discussion has taken place as to whether such periodic phenomena as leaf fall are due to habits possessed by the plants which persist regardless of environment or whether they are a response to external conditions. There is considerable evidence favoring both views. Many tropical trees grow, flower, and fruit continuously, others grow continually, but flower only in one season of the year; while still others, although evergreen, show periodicity in both their growth and reproductive activities. Some trees are deciduous in temperate regions but evergreen in more tropical lands; others persist in shedding their foliage even when climatic conditions are uniform, thus, the European oak (*Quercus robur*) and the sweet gum (*Liquidambar styraciflua*) both become evergreen in the rain forest of Jamaica, but the tulip tree (*Liriodendron tulipifera*) and the bald cypress (*Taxodium distichum*) retain their deciduous habits even under such uniformly warm and moist conditions. See DECIDUOUS PLANTS; DURATION, FOREST; LEAF

The physiological aspects of periodicity have begun to attract attention, involving as they do important facts affecting plant breeding. It might be supposed that in the temperate zone this is entirely a matter of the presence of growth conditions in the summer and their absence in the winter, but a further study shows the situation to be more complex than this. *Stellaria media* and *Senecio vulgaris* have passed through their entire life history, from seed to seed, ending with death, in a few months. Since these seeds are capable of immediate germination, several generations may appear in a single year. Many plants are true annuals, either because they require the whole growing season for one generation or because the seeds require a winter's rest or even longer before

germination. In biennials like the burdock, beet, and cabbage, the first year involves vegetative growth with abundant food storage, largely used in seed production the second year. In perennials several new features of periodicity appear. Bud formation and development of foliage from buds form one. In trees and shrubs of the temperate zone, as foliage begins to develop in the spring, buds are formed in the axils of leaves and at the end of the shoot. These buds ordinarily do not form new shoots until the following spring. They may be forced to immediate development by the removal of all leaves if this is done before July. They may be forced to foliage development from early autumn on by a great variety of stimuli, as anæsthetics, injection of water and water solutions, period of storage at high temperatures (35°-40° C.), and others. The period from July 1 to October 1 is generally marked by deep dormancy. In certain years a warm period in autumn may lead to the second formation of foliage or fruit. Also in some trees this occurs as a rule, while in the rose growth ceases only when conditions are such as to prevent it.

In trees and shrubs of the temperate zone starch formation and hydrolysis also show periodicity. The deposit of starch begins in July and continues until leaf fall. In November and the following months the starch is gradually transformed to soluble sugars in some forms and to fats in others. The period of minimum starch coincides rather closely with the end of dormancy of the buds. In the warm months of the spring starch formation at the expense of soluble sugars and fats again sets in. Starch deposit and hydrolysis are apparently entirely determined by temperature, higher temperatures produce the former and lower temperatures the latter. The question has been much discussed whether periodicity in trees and shrubs of the temperate zone is not directly or indirectly determined by periodicity in climate. In large part this seems to be the case, for when these forms are cultivated in tropical climate they readily or gradually lose the periodicity typical for the normal habitat. On the other hand, periodicity in foliage formation and leaf fall is of rather frequent occurrence, even in the almost constant climate of the wet tropics. In some trees (*Albizia moluccana*, *Artocarpus incisa*, etc.) there is a continual leaf formation and leaf fall. In others periodicity is evident apparently independent of periodicity in external conditions. For instance, in *Herea brasiliensis* of the rainy forests of Pará, 30 days of vigorous foliage formation is repeatedly alternated during the year with 10 days of rest. Klebs believes periodicity is generally the counterpart of climatic rhythm, while Volkens relates it to a necessary rhythm of the protoplasm. Küster argues that it may be independent of both climatic rhythm and rhythm specific of living protoplasm, for rhythmic structures appear in nonliving colloidal media under constant conditions.

Quite generally in plants reproduction and vegetation alternate or hold a sort of antithetical relation to each other. In many algae and fungi, but by no means all, Klebs found methods of throwing the organisms into one phase of development or the other almost at will. In this matter a variety of conditions may lead to the same result. For flowering plants, however, he derived a more general rule. High water and

salt (especially nitrates) supply, with good illumination, favors vegetation and represses reproduction; while shortage in water and salts, with good illumination, favors reproduction and represses vegetation. This is illustrated by potatoes and beans going to vines, apple trees producing vigorous vegetation and little fruit, and cereals giving abundance of straw and little grain in very rich soils well supplied with water. There are other factors of great significance in determining the dominance of reproduction of vegetation. Among these are form-determining materials within the plant and position of the organ on the plant.

Frequently the seeds and spores produced by plants will not germinate immediately, but require a rest or dormant period. In many annuals (wild oats, *Amarantus retroflexus*, etc.) only a few months are needed, which insures that the seeds will not germinate in the fall, but will be carried over to the following spring. In the cocklebur one seed germinates in the spring following ripening, and the second seed a year later, while in many seeds (*Chenopodium album*, various legumes, Malvacæ, and others) a single crop is distributed in its germination over several years. This, along with the great number of seeds produced by weeds, insures that the soil will always be well supplied with seeds in process of germination. This is one character of weeds that makes them so difficult of eradication. Dormancy, especially prolonged dormancy, is far more common in the seeds of wild plants than of those long under cultivation. Yet this character often renders commercial seeds (clover, alfalfa, etc.) ripened under certain conditions almost worthless for crop production. It is known that some seeds lie in the ground in the dormant condition, still capable of producing plants, for as long as 50 years. Delay in moist soil (if we except those requiring light for germination) is due in general to one of two characters: (1) character of the colloidal structures surrounding the embryo; or (2) character of the embryo. The structures surrounding the embryo may stop germination by preventing water absorption (many legumes, Malvacæ, Chenopodiaceæ, etc.), by limiting water absorption through mechanically restricting the enlargement of the embryo (*Alisma* and many other water plants), or by reducing oxygen supply below the minimum necessary for germination (cocklebur and many other Compositæ, *Datura*, *Chloris ciliata*, wild oats, and others). In some seeds (thorns, haws, apples, and other Rosacæ, as well as members of other families) the naked embryo can grow only after it has gone through certain changes due to a longer or shorter period of exposure in dry or in germinative conditions. In some (*Eranthis hyemalis*, *Ranunculus ficaria*, and others) this period is required for the maturing of the embryo, which is very rudimentary in the newly ripened seed. No doubt both coat and embryo characters often act together to secure delay. Consult texts cited under PHYSIOLOGY OF PLANTS; and for the ecological aspects of periodicity, consult: Georg Klebs, *Ueber die Rythmik in der Entwicklung der Pflanzen* (Heidelberg, 1911); G. Volkens, *Laubfall und Lauberneuerung in den Tropen* (Berlin, 1912); Forrest Shreve, *A Montane Rain-Forest: A Con-*

tribution to the Physiological Plant Geography of Jamaica (Washington, 1914).

PERIODIC LAW. The generally accepted embodiment of the relations existing between the properties of the several chemical elements. It may be stated as follows: If the elements are arranged in the order of their atomic weights, each of their properties varies as a periodic function of the atomic weights.

Ever since the work of Richter, Proust, and Dalton had established the idea of fixed numerical values attaching to the ingredients of compounds, an idea which was deduced by Dalton from the hypothetical existence of individual atoms identical in size, mass, and other properties for any one element, chemists sought to deduce a closer relationship between the various elements from a comparison of the masses of their respective atoms. (See ATOMIC WEIGHTS; CHEMISTRY) The first attempt was that made by Dr. Proust in 1815 to prove that all the atomic weights were even multiples of the atomic weight of hydrogen, and that the latter was the only primitive element, from which the others were derived by processes of condensation. It was soon found that very few elements possessed atomic weights that could be expressed by integers when the atomic weight of hydrogen was set at unity, and Proust's law was gradually modified to state that one-half the atomic weight of hydrogen, then that one-quarter, should be taken as the real standard. Refinements of investigation have since established the relative atomic weights to the second place of decimals, and it can now be asserted that while the number of exact coincidences with Proust's law, as compared with that of deviations from it, is greater than what would be expected by the theory of chances, it is far from justifying the recognition of Proust's law as anything like a general rule. Proust's law has, therefore, been practically abandoned. On the other hand, interesting relations were found to exist between the atomic weights of similar elements. Thus, Doebereiner established, in 1829, his so-called triads, sets of three closely related elements whose atomic weights were approximately in arithmetical progression, as lithium (7), sodium (23), and potassium (39); calcium (40), strontium (88), and barium (136); sulphur (32), selenium (79), and tellurium (127); chlorine (35.5), bromine (80), and iodine (127); iron (56), nickel (57), and cobalt (58). These triads were later extended to include longer sets, and it was also pointed out that the constant differences were in many cases multiples of 16, the atomic weight of oxygen, whence it was assumed that the heavier elements of a group might be oxides of the lightest, thus reducing the number of primordial elements considerably. The idea of connecting all the atomic weights in a single progression wherein similar elements recurred at regular intervals seems to have first occurred to De Chaucourtois, and shortly afterward Newlands; but the law in its complete form is due to Mendeléev and Lothar Meyer, who reached the same conclusion independently in 1869. As Mendeléev's exposition was by far the more convincing, he has been given the greater share of the credit.

A good idea of the fundamental principle can be obtained from the accompanying figure, in which the maximum valencies of the elements and their melting points are shown to be periodically related to the atomic weights. The latter are

laid off as abscissas, and the valencies and melting points as ordinates, on arbitrary scales. It will be seen that the two curves connecting the respective points are undulatory, with well-defined maxima and minima, which occur at regular intervals. The curves for most of the other properties which are capable of precise measurement are found to have a similar character; the maxima and minima, of course, do not always coincide with the same elements in one curve as in another, but the elements which

by Rydberg, who substitutes for the atomic weights a series of closely related numbers, which he calls the ordinal numbers of the elements. In this manner Rydberg succeeds in imparting to the periodic law a more nearly quantitative form and eliminates the apparent exceptions. Unfortunately, Rydberg is unable to ascribe to his ordinal numbers any rational significance, and until this is done his system will hardly supersede the older form of the periodic law.

occupy similar positions on one curve are also found to be similarly located on another. It is especially noticeable, moreover, that such curves indicate a relationship between the groups of elements, as well as between the elements themselves of each single group. Thus, the properties of the alkaline-earth metals are always found to be intermediate between those of the alkalis and those of the aluminium group. Breaks in the continuity of the curves indicate lack of sufficient experimental data.

The arrangement of the elements as shown in the table given on page 350 is the one generally adopted at present, and includes all the well-known elements. An asterisk marks the elements discovered since 1869. Hydrogen occupies a unique position and is generally omitted from the classification. Argon, helium, neon, krypton, and xenon were added by Ramsay as a distinct group of zero valency. The vertical columns include the elements most closely associated with one another and are known as Groups 0, I, II, etc., horizontally we have the Series 1, 2, 3, etc., in which the similarities are not great, excepting that a parallelism exists between the elements of one series as compared with those of another. The elements in odd-numbered series bear a closer resemblance to one another than they do to the elements of the intervening even-numbered series and vice versa, so that it has been found expedient to make two divisions of each group, as will be seen in the table, the odd-numbered series being set to one side, the even-numbered to the other. In the eighth group occur triplets of closely analogous elements to be discussed below. Arrangements into 15 or more individual groups, in place of the twin and triple groups here shown, have been suggested, but not generally adopted. Mention should also be made of the fact that this table can be constructed by writing the elements in the order of their atomic weights along a screw line of slight pitch upon the surface of a cylinder and then, as it were, unrolling the cylinder. Noteworthy modifications of the periodic table of the elements were proposed by Staigmüller in 1902 and by Werner in 1905. Various efforts have been made to connect all the atomic weights by a graphic equation, which would provide for an arrangement on some other kind of a spiral curve, either on a plane or in space, but they have been only moderately successful. Promising, on the other hand, is a series of interesting rules discovered

Before proceeding with a discussion of the details of the table, it may be well to inquire what significance can be attached to this periodic variability of properties as functions of the atomic weight. The many attempts to connect the atomic masses themselves in arithmetical relations would indicate a widespread opinion that the substances now called elements are really compounds of simpler substances, whose particles have a finite mass and represent individuals of distinct chemical properties, so that the chemical elements in each of the periodic groups might be likened to one of the homologous series of organic compounds (See, e.g., HYDROCARBONS). This view really antedates the periodic law, but fails in large measure to account for the resemblance existing between adjacent members of different groups. Others, especially Sir William Crookes, have held that the atoms are really fortuitous agglomerates of an indifferent primordial element and that atoms of approximately the same mass behave similarly because they vibrate similarly, while atoms of greater mass might vibrate harmoniously with the smaller ones. It is difficult to explain, according to this hypothesis of the genesis of the elements, why their number should be as limited as it is. But some facts are known vaguely pointing to the idea that the atoms of elements within the same periodic group are capable of vibrating at harmonically related rates and that the great majority of chemical and physical properties depend upon atomic vibrations. It may, however, be argued that just as violin strings may be composed of different materials and yet vibrate together according to common laws, so may the elements be composed of as many individual materials and still exhibit a periodic recurrence of properties, if the latter depend upon the harmonic vibrations of the atoms. Until much additional proof has been brought, the periodic law, while furnishing a vague indication, cannot be taken as positive evidence of the qualitative unity of matter.

In the table it will be found that the group of the column under 0 contains the elements of zero valency, the first group contains the univalent elements, the second group those which are divalent, and so on up to the seventh, where the maximum valency is seven. The maximum valency of the elements of the eighth group may be set at eight, but their compounds rarely exhibit so high a valency, and in many other respects this eighth group is rather anomalous

PERIODIC ARRANGEMENT OF THE ELEMENTS ACCORDING TO INCREASING ATOMIC WEIGHTS

Series	Groups. 0	I	II	III	IV	V	VI	VII	VIII
1		Hydrogen 1.008							
2	Helium 3.99	Lithium 6.94	Glaucium 9.1	Boron 11.0	Carbon 12.00	Nitrogen 14.01	Oxygen 16	Fluorine 19.0

									Gold, 197.2

and is taken as a transition group between the seventh and the first. Thus, the three elements copper, silver, and gold belong, with respect to many of their properties, especially when uncombined, in the eighth group; but their valency is usually low, and many of their salts are so similar to those of sodium that it is often found expedient to place them in the first group, in the positions occupied in the table by their names inclosed in parentheses. These valencies refer especially to the stable oxides. Stable compounds of hydrogen occur only in the fourth, fifth, sixth, and seventh groups, four atoms of hydrogen combining with one of each element of the fourth group, and this amount decreasing until we find the halogens in the seventh group univalent towards hydrogen. The first group includes the most electropositive elements, and there is a steady transition towards the electronegative end of the series in the seventh group, while the eighth group shows a rather sudden return towards the electropositive side. The majority of the compounds derived from elements at the left end of the table are soluble, colorless, and volatile, whereas these properties change from left to right until we find the maximum of insolubility, color, and resistance to heat in the lower right hand of the table. It is also possible to select analogous compounds of the different elements and find those of similar properties fall within a well-marked zone upon the chart. Mendeléev, in his original essay, added the following: (1) the elements which have the lowest atomic weights are those most widely distributed in nature, and also represent the most typical characteristics found in the second series of the table; (2) the atomic weight determines the character of an element, (3) from a consideration of their position in the system new analogies can be discovered between elements, (4) it may be expected that new elements should be discovered to fill blank spaces within the table, and their properties can be predicted from a consideration of those of the adjacent elements, (5) errors in the assumed atomic weights may be detected through an irregularity in the position of the element in the periodic system.

All of those statements have been verified, and the immediate acceptance of Mendeléev's views was facilitated especially by the sensational discovery of a number of elements whose properties agreed accurately with those predicted by Mendeléev. Thus, gallium, germanium, and scandium (qq.v.) had been completely described with respect to their own properties and those of their compounds before they were actually discovered. Success has also attended the attempts to correct atomic weights in several cases where the elements appeared misplaced in the original tables and were assigned to positions more in accordance with their properties, but necessitating the assignment of new atomic weights (See ATOMIC WEIGHTS.) The weakest point of the table lies in the position of tellurium, which should fall in the sixth

group, but is found to have a higher atomic weight than iodine, which undoubtedly belongs to the same series in the seventh group. Efforts to explain this discrepancy have been so far unavailing. There are also a number of elements derived from the so-called rare earths whose place in the system is not readily assignable. In the latter case, however, it may be said that their properties and atomic weights are not so well established as to cast doubt upon the theory through their failure to coincide with it. One interesting result of the theory is that of limiting the probable number of chemical elements to about 120, since the actual number of blank spaces is limited, and since it is unlikely that any elements remain to be discovered with an atomic weight less than that of hydrogen or greater than that of uranium.

Among the physical properties which appear as periodic functions of the atomic weight may be mentioned the densities of the uncombined elements and of their oxides, fusibility, atomic volume, compressibility, crystalline structure of the compounds, coefficient of expansion, refractive index, conductivity for heat and electricity, color, and velocity as ions.

As an indication of some purely chemical-periodicities the following conspectus has been arranged, in which the elements are indicated by their positions in the above table, and are generally enumerated in such order that the one which shows the property in the most marked degree has precedence. The maximum valency of the elements towards oxygen is indicated throughout by the Roman numeral of each group, omitting the peroxides, in which the oxygen appears to be linked in a different manner.

Maximum valency towards hydrogen in stable volatile compounds:

Univalent: VII; 2, 3, 5, 7, powerfully acid hydrogen compounds.

Divalent: VI; 2, 3, 5, 7; faintly acid hydrogen compounds

Trivalent: V, 2, 3, 5, 7; basic acid hydrogen compounds

Quadrivalent: IV; 2, 3, 5; neutral acid hydrogen compounds

Maximum number of hydroxyls in basic compounds:

One: I; 1, 2, 3, 6, 8. III; 11. VIII; 6 (cd).

Two: II; 2, 4, 6, 8, 3, 5, 7, 11. IV, 11. VIII, 4 (bcd)

Three: III; 3, 4, 5, 6, 7, 8, 10, 12. V; 11. VII; 4. VIII; 4a

Minimum valency in oxygen acids:

One: VII; 3, 5, 7.

Three: V; 2, 3, 5, 7. VI; 3, 5, 7.

Four: IV; 2, 4, 3, 5, 7, 11

Five: V; 4, 6, 10.

Six: VI; 4, 6, 10. VII; 4. VIII; 4a

Tendency to liberate hydrogen from water below red heat:

I; 2, 3, 4, 6, 8. II, 2, 3, 4, 6, 8. VIII; 4a.

Tendency to liberate oxygen from water:

VII; 2, 3, 5.

Elements whose chlorides are unstable towards water:

V; 3, 5, 7, 11, 4, 6, 10, 12. VI; 10, 6, 4

Elements whose sulphides can be precipitated from dilute acid solution:

VIII; 4d, 6 (abcd), 10 (abcd). II; 11, 7.

III; 11, 7. IV; 11, 7, 5. V; 11, 7, 5.

VI; 12, 10, 6

Ability to form alums with the sulphates of I; 2, 4, 6, 8:

III; 2, 4, 6, 10. VI; 4. VII; 4. VIII; 4a.

Ability to form volatile compounds with organic radicles:

With one methyl group: I; 3. VII; 2, 3, 5, 7.

With two methyl groups: II; 3, 5, 7, 11. VI; 2, 3, 5, 7.

With three methyl groups: III; 2, 3, 5, 7, 11. V; 2, 3, 5, 7, 11.

With four methyl groups: IV; 2, 3, 5, 7, 11.

Ability to form complex bases with ammonia:

VIII; 4 (cd), 6 (abcd), 10 (abcd). VI; 4. II, 3, 11.

PERIÆCI (Lat., from Gk. *Περιαίκοι*, *Periōikoi*, dwellers round, i.e., round about some particular locality or city, from *περιόικειν*, *periōikēin*, to dwell around, from *περί*, *peri*, around + *οικειν*, *oikēin*, to dwell, from *οίκος*, *oikos*, house). The subject population of Laconia and the Spartan territory. They were not slaves like the Helots (q.v.), and seem to have been allowed to govern their own towns, under Spartan oversight; but they could hold none of the higher offices of state, had no share in the general government, and, we are told, could be put to death by the ephors without a trial. They paid a contribution to the kings, but otherwise seem to have been taxed, like the Spartans, only in time of war. As the choicest lands belonged to Spartans, the Periæci seem to have devoted themselves largely to manufacture and trade, which were forbidden to the Spartans. Their work in metal, especially armor, in wool, and in leather, was celebrated and found a ready sale in foreign parts, and their coast towns seem to have enjoyed a flourishing commerce. Their numbers must have been considerable, even though the hundred cities, of which Strabo speaks, were probably most of them of no great size. The Periæci were always more numerous than their superiors, the Spartans, and this disparity increased greatly during the fourth century B.C.; but, though chafing under their inferiority, the Periæci remained loyal till the Theban invasion after the battle of Leuctra (371 B.C.), when many of them joined the victors. They were evidently trusted by the Spartans, for they not only served as light-armed troops, but formed no small part of the heavy-armed forces, while the Spartan fleet must have been almost wholly dependent upon them, and in some cases we find one of their number in command of a squadron or an allied fleet. As the acquisition of the Spartan territory was a gradual conquest, it is not likely that all the

Periœci had the same position. It may also be regarded as certain that while there may have been an Achæan element in some communities, the bulk of the Periœci were Dorian. They are called Lacedæmonians, but not Spartans. Consult the histories of Greece by Grote, Abbott, Busolt, Holm, and Meyer, and Gustave Gilbert, *The Constitutional Antiquities of Sparta and Athens* (Eng. trans., London, 1895).

PERIOSTEUM (Neo-Lat., from Lat. *periostion*, from Gk. *περιόστεος*, *periosteos*, surrounding the bones, from *περί*, *peri*, around + *ὀστέον*, *osteon*, bone). A tough fibrous membrane which surrounds each bone. It is highly vascular and is the means by which the outer layers of the shafts and the greater part of the spongy portions of the bones are supplied with blood. It consists of an outer or fibrous layer and an inner or osteogenetic layer. The inner layer is very vascular and contains many protoplasmic cells called osteoblasts. Numerous experiments show that the formation of bone is essentially due to the action of the periosteum and that, by transplanting detached portions of periosteum into muscular or other tissues, bony tissue is generated in those parts. In most cases in which this membrane has become detached in consequence of a wound or of disease, the exposed bone (except in the instance of the skull, which derives most of its nutrient matter from the dura mater, which is really the periosteum of the inner surface of the skull) perishes, but this is not invariably the case. Among its other offices it serves, by isolating the bone from the surrounding tissues, to prevent the spread of disease from them to it. The shin bone, or tibia, is thus indebted to the periosteum for its ordinary immunity in cases of ulcer in that region. Inflammation of this membrane is of common occurrence and is called periostitis (q.v.).

PERIOSTITIS (Neo-Lat., from *periosteum*). An inflammation of the periosteum (q.v.). It occurs generally on the surface of thinly covered bones, such as the tibia, clavicle, or cranial bones. It may be caused by injury and is part of acute osteomyelitis (q.v.), and, like this disease, it is often brought on in boys and young men by bathing in cold water after violent exercise, or by similar forms of exposure. When the affection is caused by syphilis, oval swellings called nodes (see *NODE*) are produced, and there is considerable nocturnal pain. Rheumatism and tuberculosis are also causes. The acute form of periostitis must be treated with poultices and antiphlogistic remedies, and opiates given to relieve the pain. In severe cases incisions must be made freely in order to relieve pressure and allow of drainage if pus has formed. The treatment of the chronic forms of this affection must be directed mainly to the diseases which originated them.

PERIPATETIC PHILOSOPHY (Lat. *peripateticus*, from Gk. *περιπατητικός*, *peripatêtikos*, given to walking about, from *περιπατεῖν*, *peripatein*, to walk about, from *περί*, *peri*, around + *πάρειν*, *patein*, to walk, from *πάρος*, *patos*, path). A name applied to the philosophy of the school of Aristotle, derived, according to some, from the name of the building in which Aristotle lectured. As a school the Peripatetics had comparatively little interest in metaphysical problems, and spent most of their effort on the study of nature and on an attempt to popularize the study of ethics. Some of them modified to a great extent the teaching of Aristotle,

chiefly in a naturalistic direction. The later members of the school were in general faithful to his teachings, and derived much of their importance from their careful work in the arrangement and explanation of his writings. The two most prominent leaders, after Aristotle's death, were Theophrastus of Lesbos and Eudæmus of Rhodes, who developed his syllogistic methods of reasoning and in the main did little more than supplement his work. Theophrastus was succeeded as head of the school in 288 or 287 B.C. by Strato of Lampsacus, who held the position for 18 years and whose teaching was in the direction of a consistent naturalism. Andronicus of Rhodes, about 70 B.C., did much for the study of Aristotle; and to him is probably due the received arrangement of Aristotle's works, beginning with the *Logic* as a necessary foundation. The Peripatetics of the period following this, while they did much for exegesis, showed a leaning towards Stoicism, and by their eclectic tendency prepared the way for the combination of various systems characteristic of Neoplatonism. Consult: J. S. Reid, edition of the *Academica* of Cicero, p. 19, and references under "Peripatetics" in the index (London, 1885); Theodor Gomperz, *Greek Thinkers*, vol. iv (Eng. trans. by G. G. Berry, New York, 1912); Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913); Ueberweg-Prächter, *Grundriss der Geschichte der Philosophie* (10th ed., Berlin, 1914).

PERIPATUS (Neo-Lat., from Gk. *περίπατος*, a walking around, from *περιπατεῖν*, *peripatein*, to walk around). This strange creature stands alone, with no animals intermediate between itself and the worms on the one hand and the true Arthropoda on the other. Originally supposed to be a worm, it is now referred to a class by itself, the Malacopoda of Blainville or Protracheata of Haeckel. It lives in the tropics, in damp places under decaying wood. In general appearance it somewhat resembles a caterpillar, but the head is soft and wormlike, though it bears a pair of antenna-like tentacles. It may be said rather to resemble superficially a leech with clawed legs, the skin and its wrinkles being like those of a leech. There is a pair of horny jaws in the mouth, but these are more like the pharyngeal teeth of worms than the jaws of arthropods. The numerous legs end each in a pair of claws. The ladder-like nervous system is unlike that of annelid worms or arthropods, but rather recalls that of certain mollusks, as well as that of certain flatworms

PERIPATUS.

and nemertine worms. Its annelid features are the large number of segmentally arranged true nephridia and the nature of the integument. Its arthropodan features, which appear to take it out of the group of worms, are the presence of tracheæ, of true salivary and slime glands, of a pair of coxal glands, as well as of claws at the end of the legs. The heart is arthropodan, being a dorsal tube lying in a pericardial sinus with many openings. This assemblage of characters is not to be found in any marine or terrestrial worm.

The tracheæ are fine unbranched tubes, without

a spiral thread, and are arranged in tufts, in *Peripatus edwardsii* opening by simple orifices or pores (stigmata) scattered irregularly over the surface of the body, but in another species (*Peripatus capensis*) some of the stigmata are arranged more definitely in longitudinal rows on each side, two dorsally and one ventrally. The stigmata in a longitudinal row are, however, more numerous than the pairs of legs.

The salivary glands, opening by a short common duct into the underside of the mouth, in the same general position as in insects, are evidently, as the embryology of the animal proves, transformed nephridia, and, being of the arthropodan type, explain the origin and morphology of those of insects. It is so with the slime glands, these, with the coxal glands, being transformed and very large dermal glands. Those of insects arose in the same manner and are evidently their homologues, while those of *Peripatus* were probably originally derived from the setiparous glands in the appendages (parapodia) of annelid worms.

The genital glands and ducts are paired, but it is to be observed that the outlets are single and situated at the end of the body. In the male the ejaculatory duct is single; in its base a spermatophore is found. It will be seen, then, that *Peripatus* is not only a composite type and a connecting link between worms and tracheate arthropods, but that it may reasonably be regarded, if not itself the ancestor, as resembling the probable progenitor of chilopods, myriapods, and insects, though of course there is a very wide gap between *Peripatus* and the other antennate, air-breathing Arthropoda.

Consult: H. N. Moseley, "On the Structure and Development of *Peripatus Capensis*," in *Philosophical Transactions of the Royal Society* (London, 1874); A. Sedgwick, "The Development of *Peripatus Capensis*," parts i, ii, iii, in *Quarterly Journal of Microscopical Science* (ib., 1885-87); A. S. Packard, *Text-Book of Entomology* (New York, 1898); for more recent scattered references, consult various volumes of the *Zoological Record* (London).

PERIPLUS (Lat., from Gk. περίπλος, *periploos*, περίπλους, *periploous*, voyage round, from περίπλεϊν, *periplein*, to sail round, from περί, *peri*, around + πλεῖν, *plein*, to sail). A name for various ancient maritime itineraries, as that of Hanno. See the second article HANNO, 1.

PERIPNEUMONIA. See PLEUROPNEUMONIA.

PERIPYTERAL (from Lat. *peripteros*, from Gk. περίπτερος, with a single row of columns around, from περί, *peri*, around + πτερόν, *pteron*, wing, row of columns). An adjective applied to a temple or like building having a colonnade of free-standing columns entirely surrounding the cella. See PERISTYLE; PSEUDOPERIPYTERAL.

PERISCOPE, pēr'ī-skōp (from Gk. περί, *peri*, around + σκοπός, *skopos*, watcher). An apparatus for conducting observations from a concealed or protected position. It consists essentially of reflecting mirrors or prisms at opposite ends of a tube with the reflecting surfaces parallel and at 45° angle with the tube's axis. The field periscope is much used in trenches and behind parapets and earthworks. The submarine periscope is a larger and more elaborate instrument. It consists of reflecting prisms at top and bottom of the vertical periscope tube with several lenses between them and an eyepiece at the

lower end. It is contained in a strong, thick casing tube, 4 to 6 inches in diameter, which is sufficiently rigid to stand the pressure of the water without material flexure. The only part of the outer tube which turns is the head, and this is attached to the inner one. The observer stands at the lower end of the inner tube, which he can turn by means of a lever or a crank and gearing. The field of a periscope of ordinary type is small, but several recent improvements have extended it somewhat. The magnification of distant objects is from 1.5 to 6 diameters. A simple form of periscope was devised more than 200 years ago; the present development dates from 1854, and the more important improvements have been effected in the past 25 years. See TORPEDO BOAT, SUBMARINE.

PERISPERM (from Gk. περί, *peri*, around + σπέρμα, *sperma*, seed). The nutritive tissue in seeds outside of the embryo sac. It represents the tissue of the nucellus which has not been destroyed by the encroachment of the sac, and is chiefly characteristic of certain of the more primitive families of Dicotyledons. The ordinary nutritive tissue of seeds is developed within the embryo sac and is known as endosperm. See SEED.

PERISODACTYLA (Neo-Lat. nom. pl., from MGk. περισσοδάκτυλος, *perissodaktylos*, having an odd number of toes, from Gk. περισσός, *perissos*, beyond the regular number of size, odd + δάκτυλος, *daktylos*, finger, toe). A suborder of the Ungulata, containing all those forms which have an odd number of toes, as distinguished from the even-toed ungulates, Artiodactyla. The third digit is always the largest and sometimes the only functional one. The carpal, metacarpal, tarsal, and metatarsal bones are correspondingly modified. The stomach is simple and nonruminant. In all living forms the horns, if present, are median and not lateral. Many fossil forms are known, but the living species are comparatively few, and are naturally and easily grouped in three families—the tapirs, rhinoceroses, and horses. See UNGULATA.

PERISTALTIC MOTION (from Gk. περισταλτικός, *peristaltikos*, compressive, from περιστέλλειν, *peristellein*, to wrap around, from περί, *peri*, around + στέλλειν, *stellein*, to place, to compress). The terms "peristaltic" and "vermicular" are applied to the peculiar wavelike motion or action of the stomach and intestines by which the food is regularly moved onward. Peristalsis takes place from one end of the intestinal tract to the other, but it is seen at its best in the small intestine. Peristaltic movements are effected by the alternate contraction and dilation of successive portions of the muscular coats. These coats are two in number, an external longitudinal and an internal circular layer of fibres, under the control of the sympathetic nervous system through the agency of the ganglionic plexus situated in the intestinal walls. In peristalsis the longitudinal fibres contract first and draw the intestine backward over the substance to be propelled, shortening and dilating the tube at this point, while the circular fibres of the same part contract in succession from above downward, forcing the substance into the next portion of the intestine, where the same process is repeated.

Under ordinary circumstances peristalsis gives rise to no sensation, the presence of food being just sufficient stimulus for normal action. In the presence of irritating substances, however,

peristalsis becomes painful, violent, and spasmodic. When the intestinal canal is empty there is probably little or no movement. See DIGESTION

PERISTOME (from Gk. *peri*, *peri*, around + *στόμα*, *stoma*, mouth). The fringe of teeth around the mouth of a moss capsule. See MUSCUL.

PERISTYLE (from Lat. *peristylum*, Gk. *περίστυλον*, *peristylon*, a building or room with columns around it). In architecture, a colonnade surrounding a building or a court, or the building or court thus surrounded. One of the characteristic divisions of the Roman house was an open court called the peristyle, similar in shape to the atrium (q.v.), but larger, and surrounded with columns carrying a roof on all sides of the central open space. See August Mau, *Pompeii: Its Life and Art*, translated by F. W. Kelsey (2d ed., New York, 1902).

PERIT, PELATIAH (1785-1864). An American merchant and philanthropist, born in Norwich, Conn., of Huguenot ancestry, and educated at Yale College, where he graduated in 1802. After acting as a clerk in a Philadelphia importing house (1805-09), he went to New York City, where he entered the firm of Goodhue & Co., shipping merchants, in 1817. From 1853 to 1863 he was president of the Chamber of Commerce, and in the latter year retired from business. Perit was prominent in many charities, especially in behalf of seamen, as a member of various boards of the Presbyterian church, and as an officer of the American Bible Society. In 1857, during the war between the New York municipal and metropolitan police, he was police commissioner and did much to restore order. His projected history of American commerce, begun after his retirement from business, was not completed.

PERITHECIUM (Neo-Lat., from Gk. *peri*, *peri*, around + *θήκη*, *thêkê*, box). One of the three types of ascocarp developed by the Ascomycetes (q.v.). It is a flask-shaped structure, lined by a hymenium (q.v.), and is characteristic of the Pyrenomycetes (q.v.) or black fungi, which includes such well-known forms as the black knot and ergot fungus.

PERITONEUM (Lat. *peritoneum*, *peritonæum*, from Gk. *περιτρίβαιον*, *peritonaion*, neut. sing. of *περιτρίβαιος*, *peritonaos*, stretched around, from *περιτείνειν*, *periteinein*, to stretch around, from *peri*, *peri*, around + *τείνειν*, *teinein*, to stretch). A serous membrane which more or less completely invests all the viscera lying in the abdominal and pelvic cavities and is then reflected upon the walls of the abdomen, so that there is a visceral and a parietal layer. Numerous folds are formed by the visceral layer as it passes from one organ to another. They serve to hold the parts in position, and at the same time inclose vessels and nerves. Some of these folds are termed ligaments, from their serving to support the organs. Thus, we have ligaments of the liver, spleen, bladder, and uterus formed by peritoneal folds. Others are termed mesenteries and connect the intestines with the vertebral column. They are the mesentery (q.v.) proper, which has been already described, the ascending, transverse, and descending mesocolon, and the mesorectum. Lastly, there are folds called omenta, which proceed from one viscus to another. They are three in number, viz., the lesser or gastrohepatic omentum, which extends from the undersurface of the liver to the lesser curvature of the stomach;

the gastrosplenic omentum; and the great (or gastrocolic) omentum, which consists of four layers of peritoneum, the two which descend from the stomach and the same two returning upon themselves and ascending as high as the transverse colon, where they separate and inclose that organ. These separate layers may be easily seen in the young subject, but in the adult they are more or less blended. The great omentum always contains some adipose tissue, which in corpulent persons often accumulates to an enormous extent. Its use appears to be (1) to protect the intestines from cold and from injury by covering them anteriorly as with an apron, and (2) to facilitate their movement upon each other during their peristaltic action. In the female the peritoneal cavity is not completely closed, as the Fallopian tubes open into it by their free extremities. Inflammation of the peritoneum is termed peritonitis (q.v.).

PERITONITIS (Neo-Lat., from Lat. *peritoneum*, *peritonæum*, peritoneum). An inflammation of the peritoneum (q.v.). Peritonitis may be acute or chronic, primary or secondary. Primary or idiopathic inflammation of the peritoneum occurs after exposure to cold or wet. Its rarity is rather remarkable, considering how frequently the pleura, pericardium, and similar structures are affected. Secondary peritonitis is due to an extension of inflammation from or perforation of one of the abdominal viscera. By extension it may follow an inflammation of the stomach or intestines or extensive ulcerations of these parts, abscess of any of the solid organs or of the retroperitoneal tissues. Perforative peritonitis commonly arises from penetrating wounds or ulcer of the stomach or bowels. An important cause is perforating appendicitis, which is responsible more often than any other single cause, and especially in young adult males. A more liberal blood supply renders the appendix of the female less liable to damage, but, on the other hand, the generative organs are a frequent means of introducing an infection into the peritoneal cavity.

Acute peritonitis generally presents well-marked symptoms. It commences with a chill, or severe pain in the abdomen may be the first symptom. The pain is at first confined to particular spots (usually in the lower part of the abdomen), but it soon extends over the whole abdominal region. It is increased, on pressure, to such an extent that the patient cannot even bear the weight of the bedclothes; and to avoid, as far as possible, internal pressure upon the peritoneum, he lies perfectly still, on his back, with the legs drawn up, and breathes by means of the ribs, in consequence of the pain occasioned by the descent of the diaphragm in inspiration. The breathing is shallow, and, less air being admitted at each movement of respiration, the number of those movements is increased. There are 40 or even 60 respirations a minute, instead of 18 or 20. The pulse is very frequent, often 120 or more in the minute, and small and tense, though occasionally strong and full at the commencement of the attack. The temperature may rise rapidly after the chill to 104° or 105°, but is subsequently lower. In some very severe cases fever does not occur throughout the attack. Vomiting is an early and prominent symptom and causes great pain. After the disease has continued for a certain time the belly becomes tense and swollen, the enlargement be-

ing caused at first by flatus and afterward also by the effusion of fluid.

The appearance of the patient when at the height of the disease is very characteristic. The "Hippocratic countenance" is more often observed in peritonitis than in any other disease except cholera—"a sharp nose, hollow eyes, collapsed temples; the ears cold, contracted, and their lobes turned out; the skin about the forehead being rough, distended, and parched; the color of the whole face being brown, black, livid, or lead-colored." Acute diffuse peritonitis is usually fatal in from 2 to 10 days. Often death occurs with great suddenness, due to cardiac paralysis.

Chronic peritonitis may result from an attack of the acute form, producing adhesions, either local or general, between the peritoneal surfaces. The intestines may be matted together or compressed at particular points by fibrous bands. Often there are no symptoms, but if the intestine is constricted colicky pains will be felt. Tuberculosis may cause either acute or chronic peritonitis, but usually the latter. It occurs at all ages and presents symptoms of extraordinary complexity and diversity. Sometimes the condition is discovered by accident, during an operation for some other trouble. Caseous masses form, the mesenteric glands are enlarged, and the omentum is irregularly thickened. These masses can be felt through the abdominal walls. Cancerous peritonitis is usually an extension from some other organ.

The treatment of acute peritonitis must be prompt, vigorous, and persistent. In the earliest stage it may be aborted or limited by the use of ice bags locally and a saline or calomel purge. Complete rest is demanded at all stages of the disease. One of the most valuable aids is slow, continuous irrigation of the lower bowel—the "Murphy drip." The intestinal movements may be quieted and pain allayed by the administration of opium, and in the height of the disease this is the only drug worth considering. Tolerance to opium in peritoneal inflammation is great, and comparatively large doses must be given. When due to perforation, as in appendicitis, prompt operation will often prevent the spread of the infection. Tuberculous peritonitis is often cured by simply opening the abdomen, exposing the tuberculous masses to the air, and flushing out the cavity with saline solution. General treatment is unsatisfactory, but fresh air, tonics, cod-liver oil, and creosote may effect a cure.

PERITYPHLITIS (Neo-Lat., from Gk. *peri*, *peri*, around + *typhlos*, *typhlos*, blind, with allusion to the cæcum). An inflammation of the peritoneal covering and the loose connecting tissue attaching the cæcum and ascending colon to the iliac fascia. Formerly what is now known as appendicitis was thought to be due to inflammation of the cæcum, or typhlitis, and of the peritoneum covering it, or perityphlitis; but these conditions are now believed to exist independently of appendicitis only in exceptional cases. See CÆCUM; COLON; VERMIFORM APENDIX.

PERIWINKLE (AS. *pervinca*, *pervince*, *pervenke*, from Lat. *pervinca*, periwinkle, from *per*, through + *vinca*, twist, from *vincire*, to bind), *Vinca*. A genus of plants of the family Apocynaceæ, having a five-cleft calyx and a salver-shaped corolla bearded at the throat, opposite evergreen leaves, and flowers which grow

singly or in pairs from the axils of the leaves. The lesser periwinkle or myrtle (*Vinca minor*), growing in woods and thickets of Europe, is a half-shrubby plant with trailing stems which root at their nodes, ovate-lanceolate leaves, and pale-blue or sometimes white or reddish-purple flowers. The greater periwinkle (*Vinca major*),

GREATER PERIWINKLE.

which has much larger flowers and ovate-cordate ciliated leaves, is a native of the south of Europe. These species are commonly planted in shrubberies and gardens because they rapidly cover unsightly objects with pleasing green foliage and produce beautiful flowers at almost all seasons of the year, even in mild winters. They have escaped in the United States. The former is very commonly found and the latter, which is less hardy, occasionally. The herbaceous periwinkle (*Vinca herbacea*), a Hungarian species, is remarkable for the abundance of its flowers. The rose-colored periwinkle (*Vinca rosea*), a native of Madagascar, is a favorite greenhouse plant.

PERIWINKLE. A small gastropod mollusk of the genus *Littorina*, characterized by the shell being top-shaped, solid, the columella thickened, the lip of the aperture simple, not toothed, and the round aperture closed by a horny operculum. The animal has long tentacles, with an eye at the base of each tentacle. Periwinkles either lay eggs or are ovoviviparous. They abound in vast numbers on the rocky shores of

AMERICAN PERIWINKLES.

1, *Littorina rudis*. 2, *Littorina littorea*. 3, *Littorina palliata*.

the North Atlantic between tide marks and especially near low-water mark. They feed on seaweeds. The two native species are *Littorina rudis*, rather elongated with a high spire, and *Littorina palliata*, which has a low spire with the body whirl rather swollen. The latter varies

greatly in color from pure olive green to yellow or even bright red, with revolving black lines, the colors more or less simulating that of the seaweeds among which it lives.

A much larger species, and now more abundant on the coast north of New York than any other, is *Littorina littorea*, which in 1857 was introduced from Europe into Nova Scotia and now abounds in vast numbers all along the coast. It lives nearer low tide than the native species and frequents exposed rocks not covered by seaweeds. It is a much larger and heavier shell than the others and varies much in the height of the spire. Bumpus has shown that since its introduction into America, where it has been subjected to a new environment, this shell differs from those of England in being more elongated, lighter in weight, more bulky, while the color markings are less pronounced. It also appears that there are already many local races on the New England coast. These mollusks are able to live for days and even weeks out of the sea, in one case four months. The power of resisting dryness seems to be still greater with tropical species. In Jamaica *Littorina muricata* lives among grass and herbage at the top of low cliffs. At Panama three large species were found on trees at and above high-water mark. The eggs of those *Littorinae* which are not ovoviviparous are deposited on seaweeds, rocks, etc., enveloped in a glairy mass just firm enough to retain its shape.

The name "periwinkle" is given popularly to almost any small spiral shell, especially along the shores of the Great Lakes to the turret-shaped pulmonates of the genus *Melania*. In the shortened form, "winkle," it is applied by the oystermen in the neighborhood of New York to the conchs (*Fulgur*) which feed upon the oyster beds. See COCKLE.

PERJURY (Lat. *perjuriū*, false oath, from *perjurus*, one who swears falsely, from *perjurare*, to swear falsely, from *per*, through + *jurare*, to swear, from *jus*, right, law). At common law, the crime of knowingly and willfully giving false testimony which is material to a question in issue in a judicial proceeding. The offense is committed whether the testimony is given under oath or affirmation, provided either is administered by a competent authority. If a witness makes a misstatement through inadvertence or mistake, he is not guilty of the crime; but if he recklessly and knowingly makes a statement as to the truth or falsity of which he has no knowledge, it has been held to constitute perjury. A witness may be convicted of perjury under such circumstances, even though the facts to which he testifies subsequently prove to be true. It is not essential to constitute the offense that the testimony be believed or that it cause a perversion of justice in the cause in which it is given.

In most jurisdictions to-day, as at common law, a voluntary oath taken outside a judicial proceeding cannot be made the basis of a charge of perjury, as the law does not punish criminally prevarication in private matters. An exception to this exists under the laws of the United States. See OATH.

At the early common law the testimony of two witnesses was necessary to convict a witness of perjury. However, to-day in most jurisdictions the testimony of one witness supported by proof of corroborating circumstances is sufficient.

Perjury has always been severely punished, as it tends to the perversion and obstruction of justice. In ancient times in England the penalty was death, subsequently banishment or cutting out the tongue, after the Norman era forfeiture of goods and imprisonment; and at present in England and the United States it is punishable by fine or imprisonment, or both. In a few States a person so convicted is thereby rendered incompetent to give testimony in judicial proceedings.

Subornation of perjury consists in inciting or procuring another to commit perjury. The witness must have actually committed perjury in order to render the person who incited him to do so guilty of the crime. An attorney calling a witness who he believes will not tell the truth does not thereby become liable if the witness does in fact commit perjury, if he did not actually connive at it or solicit him to do so. Subornation of perjury is usually punished with as much severity as perjury itself. Consult the authorities referred to under CRIMINAL LAW and EVIDENCE. See OATH; WITNESS.

PERKASIE, pĕrk'ā-sī. A borough in Bucks Co., Pa., 35 miles north of Philadelphia, on the Philadelphia and Reading and the Lehigh Valley Traction Company railroads (Map: Pennsylvania, L 6). There are silk mills, brickyards, lumber mills, tile works, a stone crusher, and manufactories of cigars, tags and labels, wire novelties, etc. The electric-light plant is owned by the borough. Pop., 1900, 1803; 1910, 2779.

PERKIN, SIR WILLIAM HENRY (1838-1907). An English chemist, born in London. He studied at the Royal College of Chemistry, London, where he was an assistant in Prof. A. W. Hofmann's research laboratory. In 1856 he discovered aniline purple, or mauve, or Perkin's purple, thereby becoming founder of the coal-tar colors (q.v.) industry. He invented also a process of manufacturing madder red, or alizarin, and of making coumarin from the Tonka bean and cinnamic acid from benzaldehyde. Perkin received the Hofmann medal from the Deutsche Chemische Gesellschaft, the Lavoisier medal from the Société Chimique de Paris, and the Davy medal from the Royal Society. He was president of the Chemical Society in 1883-85 and was knighted in 1906. The Perkin Memorial Fund to promote chemical research and a Perkin medal for American chemists were provided for after his death.

PERKIN, WILLIAM HENRY (1860-). An English chemist, son of Sir William Henry Perkin, born at Sudbury, Middlesex. He was educated at the Royal College of Science, and also studied at the universities of Wurzburg and Munich. At the latter school he lectured in 1883-86, was professor of chemistry at Heriot-Watt College, Edinburgh, in 1887-92, and later held the same chair at Victoria University. In 1904 he was awarded the Davy medal by the Royal Society, on whose council he served in 1904-05 and 1908-10. His numerous papers in the *Journal of the Chemical Society* deal largely with alkaloids, camphor, and natural coloring matters. Perkin is author of *Organic Chemistry* (new ed., 1911), with F. S. Kipping.

PERKINS, BENJAMIN DOUGLAS. Son of Elisha Perkins (q.v.) and agent in London for his father's "tractors."

PERKINS, CHARLES CALLAHAN (1822-86). An American art historian, born in Boston. After graduating from Harvard he lived for a time

in Rome, then studied painting in Paris under Ary Scheffer, and on a subsequent visit in 1865 took up etching under Bracquemont and Lalaine. He was one of the founders and honorary director of the Boston Museum of Fine Arts and in 1868 became a corresponding member of the French Institute. He also cultivated music, was president of the Handel and Haydn Society in 1870-83, and occasionally conducted its performances. Through his writings and lectures he contributed much to the promotion of art in this country and enjoyed wide reputation as a critic, but his views have been largely superseded by modern research. He published, *Tuscan Sculptors* (1864) and *Italian Sculptors* (1868), his most important works, both with etchings by the author; *Art in Education* (1870); *Raphael and Michelangelo* (1878), a biographical and critical essay; *Sepulchral Monuments in Italy* (1883); *Ghiberti et son école* (1885). *The Historical Handbook of Italian Sculpture* (1883) is practically a new edition of *Tuscan Sculptors* and *Italian Sculptors*. He was also critical editor of the *Cyclopaedia of Painters and Paintings*, edited by Champlin (1885-87).

PERKINS, ELISHA (1741-99) An American physician, born in Norwich, Conn. He is chiefly known for the invention in 1796 of Perkins's metallic tractors, pins or bars of iron and brass, supposed to possess curative virtues, which were drawn in a certain way over the affected parts in rheumatism, gout, neuralgia, and local inflammations. This method of treatment was called Perkinism, and for a time it enjoyed a certain vogue both in Europe and America. Perkins afterward invented a medicine for fevers, whose efficacy he undertook to prove during the yellow-fever epidemic in New York in 1799, but he himself fell a victim to the disease.

PERKINS, GEORGE CLEMENT (1839-). An American legislator, banker, and shipowner, born at Kennebunkport, Me. At 13 he ran away from home and went to sea as cabin boy, made several trips across the Atlantic, and finally, when 16, shipped before the mast on a vessel sailing to San Francisco around the Horn. On his arrival in 1855 he engaged in mining, then became clerk in a store and eventually its owner. Later he acquired banking, milling, and sheep-raising interests. From 1868 to 1874 he served in the California Senate. Moving to San Francisco from Oroville, he became a member of the firm of Goodall, Perkins, & Co., owners of the Pacific Steamship Company, operating vessels to the Orient and Alaska. A Republican in politics, in 1879 Perkins was elected Governor and had a successful administration. In 1893 he was appointed United States Senator to fill the unexpired term of Senator Leland Stanford. By election he remained in the Senate until his retirement in 1915.

PERKINS, GEORGE WALBRIDGE (1862-). An American financier and political leader, born in Chicago. He received a common-school education and early entered the employment of the New York Life Insurance Company in the Chicago office. There he rose from bookkeeper through various positions to third vice president in 1892, with supervision of the entire agency force, second vice president (1898), chairman of the finance committee (1900), and first vice president (1903). He won a wide reputation for ability in finance. In 1901 he entered the firm of J. P. Morgan as partner and participated in many of the great financial transactions of

that house. He became chairman and director of the International Harvester Company, and director of the International Mercantile Marine Company, the United States Steel Corporation, and many railroad, banking, and insurance companies. The remarkable success of the International Harvester Company was largely attributed to his administration. Perkins was also active in politics, first in the Republican party and later in the Progressive, of whose national executive committee he became chairman. To Roosevelt's campaign for the presidency in 1912 he contributed liberally in funds and in personal service, becoming known as one of the Colonel's most ardent admirers. He endorsed the position of the Progressive party on the trust question and contended that there were some "good corporations" doing big business. In his opinion the Steel Corporation and the Harvester Company were such concerns. In 1915 he pledged himself to lead the effort to prevent Progressives from rejoining the Republicans.

PERKINS, JACOB (1766-1849). An American inventor, born at Newburyport, Mass. While still a boy serving his apprenticeship to a goldsmith, he invented a process of plating shoe buckles. In 1787 the Massachusetts State government engaged him to cut dies for its mint. Later he improved bank-note engraving by substituting steel plates for copper, and in 1800 he invented a machine by which nails could be cut and headed at the same time. When 52 years of age he went to London, where he secured remunerative contracts. He supplied plates to the Bank of Ireland, built steam engines, and completed a number of inventions, among which were a process for transferring engravings from one steel plate to another; the pleometer, an instrument to measure the speed of ships; the bathometer, an instrument to measure the depth of water; and a rapid-firing gun.

PERKINS, JAMES BRECK (1847-1910). An American historian and legislator, born at St Croix, Wis. He graduated at the University of Rochester in 1867, was city attorney of Rochester from 1874 to 1878, became a member of the New York Assembly in 1898, and served as a representative in Congress from 1901 till his death. Recognized as the leading authority in the particular historical field to which he devoted himself, he was honored by membership in the National Institute of Arts and Letters. His writings include: *France under Mazarin* (1887); *France under the Regency* (1892); *France under Louis XV* (1897); *Richelieu* (1900), in the "Heroes of the Nations Series"; *France in the American Revolution* (1911).

PERKINS, JUSTIN (1805-69). An American missionary. He was born at West Springfield, Mass., graduated at Amherst College in 1829, studied theology at Andover, embarked at Boston, 1833, as a missionary of the American Board, and established the Nestorian mission at Urumiah, Persia, in 1834. He was joined by Dr. Asahel Grant (q.v.) in 1835. In 1842 he visited the United States, accompanied by Mar Yohannan, the Nestorian Bishop. Besides a translation of the Bible into modern Syriac (2 vols., 1846-52) and commentaries on Genesis and Daniel (1869), Dr. Perkins published *Eight Years in Persia* (1843); *Missionary Life in Persia* (1861).

PERKINS, THOMAS HANDASYD (1764-1854). An American merchant and philanthropist, born

in Boston. In 1785 he entered into partnership with his brother James in Santo Domingo and was later representative of the firm in the United States. In 1789 he went to Batavia and Canton, to familiarize himself with the Chinese and East Indian trade, and after his return settled in Boston, where he became very successful. He was one of the originators of the Quincy Railroad (the first in the United States), founded the Perkins Asylum for the Blind, contributed liberally towards the erecting of the Bunker Hill Monument, and was one of the chief benefactors of the Boston Athenæum and the Massachusetts General Hospital. Consult T. G. Cary, *Memoirs of Thomas Handasyd Perkins* (Boston, 1856).

PERKIN WARBECK. A pretender to the throne in the reign of Henry VII of England. See WARBECK, PERKIN.

PERKIN WARBECK, THE CHRONICLE HISTORY OF. A tragedy by John Ford (1634), on the career of the pretender of that name. The source was probably Bacon's *Life of Henry VII.*

PERKNITE (from Gk. *περκνός*, *perknos*, dark; connected with Skt. *prāni*, spotted). An igneous rock of granitic texture, composed essentially of augite or hornblende. The term is applied rather to a family of rocks than to an individual species. Perknites are rich in lime and magnesia and low in silica, alumina, and the alkalis. They have generally been included under the family name pyroxenite (q.v.), which has a wider scope of meaning and includes magnesian as well as lime-magnesian rocks.

PERKS, SIR ROBERT WILLIAM (1849-). An English construction engineer, born in Kensington, the son of a prominent Wesleyan minister. He was educated at King's College, London, and from 1878 to 1892 was a railway lawyer. Then, until 1912, he was with Walker & Co., on such construction work as the Manchester Ship Railway, the harbor works and quays at Rio de Janeiro, the Buenos Aires port extension, and the Transandine Railway. He then formed the establishment called Macarthur, Perks, & Co., which built great docks at Havana, and pushed the building of the Georgian Bay Canal. In 1898 he started the Wesleyan Methodist Twentieth Century Million Fund, of which he was treasurer. From 1892 to 1910 he was a Liberal member of Parliament for the Louth Division, Lincolnshire. He was made Baronet in 1908.

PERLES, pēr'lēs, JOSEPH (1835-94). A German rabbi and Orientalist. He was born at Baja in southern Hungary and studied at Breslau, where he took his doctor's degree in 1859, his thesis being *Meletemata Peschiththioniana*. This monograph advanced the theory that the Peshitto version, though preserved only by the Christian Church, is Jewish in tone and influence. In 1862 Perles became rabbi at Posen, whence he went to Munich in 1871. Besides the dissertation already mentioned, Perles published valuable papers on the history of the Jews during the Middle Ages and on Hebrew etymology and philology.

PERLEY, SIR GEORGE HALSEY (1857-). A Canadian statesman. He was born at Lebanon, N. H., and was educated at St. Paul's School (Concord, N. H.) and at Harvard University. Entering business in Canada, he became prominent as a lumber merchant and manufacturer and engaged also in banking and railroad-ing. In 1900 and 1902 he was an unsuccessful

Conservative candidate for the House of Commons, but was elected for Argenteuil in 1904. He was appointed chief whip for the Conservative party in 1911 and actively opposed the Taft-Fielding reciprocity agreement. On the defeat of the Laurier administration in 1911 he became a Minister without portfolio in the administration of Robert Laird Borden (q.v.). After the death of Lord Strathcona and Mount Royal in 1913, Perley was appointed acting High Commissioner for Canada in London. In 1915 he was knighted (K.C.M.G.).

PERLEY, HENRY FULLERTON (1831-97). A Canadian engineer, son of Moses Henry Perley (q.v.). He was born at St. John, New Brunswick, was educated at Fredericton, studied civil engineering, and in 1848-52 made railway surveys for the provincial government. In 1854-56 he was employed in Grand Trunk Railway construction and in 1856-60 was resident engineer for the New Brunswick government in the construction of the St. John and Shediac Railway. After two years as engineer for the Nova Scotia government he went to England in 1865 to take a prominent part in the construction of the Metropolitan Extension Underground Railway in London. In 1870-72 he was again in the New Brunswick government service and in 1872-79 served as Dominion engineer in charge of harbors in the Maritime Provinces. Perley was appointed chief engineer of the Department of Public Works at Ottawa in 1879.

PERLEY, MOSES HENRY (1804-62). A Canadian administrator and scientist, father of Henry Fullerton Perley. He was born at Mau-gerville, New Brunswick, was educated at St. John, and was called to the bar in 1830. He did not practice his profession, but engaged in the milling and lumbering business. His love of exploration and his ability in the natural sciences gradually made him an expert on the physical resources of the various British North American provinces. About 1840 he was appointed Indian Commissioner and Emigration Agent for New Brunswick. In 1848-51 he made valuable reports on the fisheries of New Brunswick, Gulf of St. Lawrence, and the Bay of Fundy. During the negotiations preceding the Reciprocity Treaty of 1854-66 between the United States and Canada (see RECIPROCITY) Perley was foremost in procuring decisive information on the Canadian side, and in 1854-62 he served as Imperial Commissioner to aid in carrying the terms of the treaty into effect. He founded the Natural History Society of New Brunswick and contributed to several English and American literary and scientific journals. Besides his reports on fisheries he published: *Report on the Forest Trees of New Brunswick* (1847); *Catalogue of Fishes of New Brunswick and Nova Scotia* (1851); *Observations on the Geology and Physical Characteristics of Newfoundland* (1862).

PERLITE. See IBON.

PERM, perm. A government of east Russia consisting of 12 districts and bounded by the Government of Volgoda on the north, Tobolsk on the east, Orenburg and Ufa on the south, and Viatka on the west (Map: Russia, J 3). Area, about 127,600 square miles. While politically a government of European Russia, geographically Perm belongs partly to Asia. The centre of the region is occupied by the Ural Mountains (q.v.), which traverse the district from north to south. They hardly exceed 5000 feet in their highest

points. The eastern part of the government is lower than the western. (For geology, see **PERMIAN SYSTEM**.) Perm is watered by the Kama, Petchora, and Sosva, with their tributaries. The largest of these streams are navigable.

The climate is continental and harsh, especially in the mountainous districts of the centre. In regard to its mineral deposits Perm exceeds every other government of European Russia. The chief minerals are gold, silver, iron, copper, platinum, nickel, zinc, coal, and salt. Precious stones, such as sapphires, jacinths, topazes, and many others, are also found in considerable quantities. The mining of iron and copper employs about 200,000 persons. The value of the annual output approximates \$30,000,000. The annual output of gold exceeds \$2,500,000, while the output of coal is still inconsiderable.

Agriculture is carried on all over the district, but only in the black-soil region of the south is production equal to requirements. Stock raising is especially developed among the Bashkirs. Perm has extensive forests, which cover over 80 per cent of the total area. Lumbering and shipbuilding are carried on to some extent. The house industry is favored by the abundance of natural resources. The products of that industry include hardware, pottery, wooden articles, yarns, coarse cloth, ropes, trunks, etc. The manufacturing industries are chiefly in connection with the mineral industries, viz., the manufacturing of steel, iron, etc. The fairs of Irbit (q.v.) are of considerable importance in the trade with the eastern possessions of Russia, but since the construction of the Trans-Siberian Railway the commerce has fallen off to a perceptible extent. Pop., 1913, 3,912,700, including a considerable number of Bashkirs, Permiaks, Tatars, Tcheremisses, and Voguls. The exploitation of the mining resources of the region was begun by the Stroganovs in the sixteenth century. Capital, Perm.

PERM. The capital of the government of the same name in east Russia, on the left bank of the Kama, 300 miles northeast of Kazan (Map: Russia, J 3). It is regularly laid out; the houses are mostly of wood. Its educational institutions comprise two Gymnasias, a Realschule, a museum, a meteorological station, and a number of scientific societies. There are several machine works, tanneries, etc., and the port carries on an extensive transit trade during the navigable season. Pop., 1911, 61,614. The town was founded on the site of a mining settlement in 1781.

PERMANGANIC ACID. See **MANGANIC** AND **PERMANGANIC ACIDS**.

PERMEABILITY. The permeability of various membranes of plants is of great significance in determining the interchanges of materials between these organisms and their environment. The undifferentiated cell walls of plants are very permeable to water and to most solutes dissolved in it. Differentiated walls often behave differently. Dried seed coats are impervious to gases and to liquids like ether and chloroform, while soaked coats allow these substances to pass readily. The coats of some seeds are impervious to water and such seeds can lie in water for years without noticeable swelling. Many seed coats and other plant membranes are highly permeable to water, but prevent the passage of sugar and other organic materials and certain salts dissolved in the water. Such semipermeable

membranes are of great physiological significance in preventing the loss of organic and perhaps often inorganic materials from plant organs in contact with wet soil or water. See **ABSORPTION**; **OSMOSIS**.

PERMEABILITY, MAGNETIC. See **MAGNETISM**.

PERMIAN SYSTEM. A name first applied by Murchison in 1841 to a group of rocks occurring in the Province of Perm, Russia. The strata which he included under this name had up to that time been considered as a division of the Triassic. In Russia the Permian strata occupy an area twice the size of France, and they are also largely developed in Germany and in England. In Germany, where the strata are naturally divided into two great series, the name *Dyas* is commonly applied to the system. In the United States the Permian succeeds the Carboniferous without any notable break in the sedimentary accumulations, so that the division must be made largely upon the evidence afforded by fossils, and some geologists consider it as the uppermost part of the Carboniferous system. The present tendency, however, is to follow the European classification and to give it independent rank as one of the main divisions of the Paleozoic group. The Permian system includes the Upper Barren measures in the Appalachian area, consisting of 1000 feet of sandstones and shales, and various formations in Missouri, Kansas, Nebraska, and Texas, which range up to 5000 feet thick. In Kansas the beds include important deposits of gypsum and rock salt. Consult Williams, "Correlation Papers, Devonian and Carboniferous," in *United States Geological Survey, Bulletin 80* (Washington, 1891). See **CARBONIFEROUS SYSTEM**.

PERMIT' (corruption of *Sp. palometa*). A West Indian fish, the great pompano (*Trachinotus goodii*), also called palometa. See **POMPANO**.

PERMUTATIONS AND COMBINATIONS (Lat. *permutatio*, from *permutare*, to change entirely, from *per*, through + *mutare*, to change, frequentative of *movere*, to move, Skt. *mv*, to push). The different groups of r things which can be selected from a collection of n different things, without reference to their arrangement, are called the *combinations* of n things taken r at a time. For example, the combinations of the four letters a, b, c, d taken 3 at a time are abc, abd, acd, bcd ; taken 2 at a time ab, ac, ad, bc, bd, cd . The different groups of r things which can be selected from n different things, varying the arrangement in every possible manner, are called the *permutations* of n things taken r at a time. For example, the permutations of the letters a, b, c taken 2 at a time are ab, ba, ac, ca, bc, cb . The number of combinations of n things taken r at a time may be indicated by the symbol C_r^n . The number of permutations of n things taken r at a time may be indicated by the symbol P_r^n . The chief properties of permutations and combinations are: 1. The number of permutations of n different things taken r at a time is $n(n-1)(n-2) \dots (n-r+1)$. For example, the number of permutations of the letters of the word "courage" taken three at a time is $7 \cdot 6 \cdot 5 = 210$. 2. The number of permutations of n things taken all together is $n(n-1)(n-2) \dots 3 \cdot 2 \cdot 1 = n!$, or, as it is commonly written in England and America, $n!$. 3. The number of permutations of n different things taken r at a time, when each of the n things may be repeated, is n^r ; e.g., the

number of ways of selecting 3 numbers from 50 on a combination lock, repetitions being allowed, is $50^3 = 125,000$. 4. The number of combinations of n different things taken r at a time is

$$\frac{n(n-1)(n-2)\dots(n-r+1)}{r!},$$

or

$$\frac{n!}{r!(n-r)!}$$

e.g., 3 persons can be selected from a class of 20 in $\frac{20 \cdot 19 \cdot 18}{3!} = 1140$ different ways.

The formulas of permutations and combinations express many relations of both algebra and geometry and possess a peculiar interest in mathematics. For example, the coefficients in the binomial expansion for a positive integral exponent may be expressed by formulas of combinations thus, $(a+b)^n = a^n + C_1^n a^{n-1}b + C_2^n a^{n-2}b^2 + C_3^n a^{n-3}b^3 + \dots$. The maximum number of vertices of a general polygon of n sides is expressed by C_2^n . Also, such problems as those of combination locks, of the number of signals with a given system of signs, and of forming all possible numbers from given digits, are solved with unusual brevity by means of the formulas of permutation and combination. This subject was known to the Hindus, particularly to Bhaskara (born 1114), and is related to the subject of probability (q.v.). Its principles are often explained in textbooks under the title *Choice*. By *cyclic permutation* is meant the interchange of the elements of a function in cyclic order. For example, $(a-b) + (b-c) + (c-a)$ becomes $(b-c) + (c-a) + (a-b)$ by the cyclic interchange of a for b , b for c , and c for a .

PERN. See HONEY BUZZARD.

PERNAMBUCO, pĕr'nám-bŭŭ'kô. An eastern state of Brazil, bounded by Parahyba and Ceará on the north, Piahy on the west, Bahia and Alagoas on the south, and the Atlantic Ocean on the east (Map: Brazil, K 5). The area is 49,473 square miles. The coast region is low, and the interior is occupied by barren plateaus known as sertões, which pass into mountain ranges near the western frontier. A long reef of sandstone extends along the coast and forms a great hindrance to navigation. The rivers are mostly short and flow either eastward into the Atlantic Ocean or southward into the São Francisco River. The climate in general is healthful; it is hot and moist along the coast, hot and dry in the interior, and cool in the more elevated regions. The low strip of coast land is covered with fine forests and is the centre of population as well as of agricultural activity. Pernambuco is the leading state of Brazil in the production of cotton and sugar cane. Coffee, cacao, tobacco, fruits, and cereals are also grown. The chief industries are sugar manufacture and cotton spinning. It exports cotton, sugar, rum, coffee, cacao, and medicinal plants. There are 560 miles of railway, all in the eastern part of the state. A new line is under construction in the north-central portion. The capital and chief seaport is Pernambuco (q.v.). Pop., 1900, 1,178,150; 1913 (est.), 1,375,765.

PERNAMBUCO, or RECIFE. The capital of the State of Pernambuco, Brazil, situated on the Atlantic coast at the easternmost point of the continent (Map: Brazil, L 5). It consists of three parts connected by bridges and causeways: the oldest, or Recife proper, is built on an outlying peninsula, connected with the mainland

by an isthmus, and is the principal commercial section; the central part, called São Antonio, stands on an island between a reef and the mainland, and contains most of the public buildings; the third portion, Boa Vista, is built on the mainland, and is the residential section, with broad streets and beautiful gardens. There are several street-car lines, one of which runs to the suburb of Olinda (q.v.), the former capital of the state. Pernambuco has some of the finest churches and public buildings of the country and numerous charitable and educational institutions, the latter including a celebrated law school and an excellent secondary college. The task of remodeling and sanitation, now in process, will transform it into a modern city. The harbor proper is inclosed by a reef cut by several navigable passages, but the largest ships have to anchor in an open roadstead. Extensive port works are in progress, which will make the inner harbor accessible to all vessels. Pernambuco is the nearest to Europe of the important ports of Brazil. It is on the direct route of the trade to southern South America and is a port of call for numerous steamship lines from Europe. It is the outlet for the products of the state, the chief of which are sugar, cotton, rum, skins, coffee, and cacao. In 1912 its trade amounted to, imports 48,984,026 milreis paper (nominal value of paper milreis 32.4 cents; exchange value stated by United States Treasury Department in October, 1914, as about 25 cents) and exports 13,893,221 milreis paper. It is the seat of a United States consul. The population by the census of 1890 was 111,556, and in 1913 it was estimated at 180,000; including the suburbs, 250,000. Recife was founded in 1504. It was held by the Dutch from 1630 to 1654, but it was then a mere village and did not acquire much importance until it superseded Olinda as capital.

PERNAMBUCO WOOD. See BRAZILWOOD.

PERNAU, pĕr'nou (Russ. *Pernov*). A town in the Government of Livonia, Russia, on both banks of the river Pernau, a short distance from the Gulf of Riga, and 100 miles north by east of Riga (Map: Russia, B 3). It is a well-built town with public gardens, a Gymnasium, and a number of benevolent institutions. The trade in grain is still considerable, but the commercial importance of the port has decreased owing to the competition of the other Baltic ports. The town was founded in 1255 by the Bishop of Oesel and was a flourishing centre in the Middle Ages. It was taken by the Russians in 1710. Its fortifications have since been demolished. Pop., 1897, 12,856; 1910, 16,258.

PERNIO, pĕr'ni-ô. See CHILBLAIN.

PERNTER, pĕr'n'tēr, JOSEF MARIA (1848-1908). An Austrian meteorologist, born at Neumarkt, south Tirol, March 15, 1848. Upon graduating from the University of Innsbruck in 1864 he joined the Society of Jesus, intending to become a priest, but he resigned in 1877 and three years later took his Ph.D. in physics at the University of Vienna. Already he had devoted much attention to meteorology, teaching it in the university, and serving in various capacities at the Vienna Central Meteorological Institute. In 1890 he was appointed extraordinary professor and in 1893 regular professor of cosmical physics at the University of Innsbruck, where he remained until 1897. During this period he founded a model Institute for Cosmical Physics, established regular meteorological ob-

servations, and continued his investigations into the nature of the foehn, the change of the psychrometric constant with pressure, and carried out radiation observations at both high and low levels. At Innsbruck, also, Pernter further developed that interest in meteorological optics which later bore fruit in the form of the most comprehensive and orderly treatise on the subject that had ever appeared. His *Meteorologische Optik* began to issue from the press in 1902; it was completed in 1910, after his death, by one of his younger Vienna associates. While at Innsbruck he also prepared a German translation of Abercromby's *Weather*.

Pernter was appointed professor of terrestrial physics at the University of Vienna in 1897 and at the same time was made director of the Central Institute of Meteorology and Earth Magnetism. During the next 10 years he more than doubled the size and resources of the institute, reorganized its management, added a reading room, a laboratory, and a printing office, and established a free telegraphic weather-warning service throughout Austria during the season April 1 to September 30. He also secured the transfer to the Central Meteorological Institute of the extensive system of seismological stations previously maintained by the Imperial Academy of Sciences. About this time, also, the title of the institute was changed to indicate the increased scope of its functions; it became the Central Institute of Meteorology and Geodynamics. With Trabert, he made an important report to the Conference of Experts at Graz in 1902, completely discrediting weather shooting as a protection against hail. Pernter died after a long illness, at Arco, south Tirol, Dec. 20, 1908. Among his important works, besides *Meteorologische Optik*, are: *Ueber den taglichen und jährlichen Gang des Luftdruckes auf Berggipfeln und in Gebirgstälern* (1881); *Ueber die Häufigkeit, die Dauer und die meteorologischen Eigenschaften des Fohns in Innsbruck* (1895); *Untersuchungen über das Wetterschiessen* (1900). Consult a biographical sketch with portrait and bibliography, in *Meteorologische Zeitschrift* (Brunswick, May, 1909), pp. 193-198.

PÉRONNE, pá'rón'. A fortified town and the capital of an arrondissement in the Department of Somme, France, on the Somme, 94 miles north by east of Paris (Map. France, N., H 3). It has a restored sixteenth-century church, a mediæval castle, and a communal college. It manufactures sugar, oil, and machinery. Charles the Simple and Louis XI were imprisoned here. The town was unsuccessfully besieged by the Imperialists under the Count of Nassau in 1536 and acquired the name of La Pucelle (the impregnable), but in 1815 it surrendered to the English under Wellington. The town was almost destroyed by the Germans, to whom it surrendered, in 1871; it has since been rebuilt. Péronne was captured by the Germans in the European War which began in 1914. See WAR IN EUROPE. Pop., 1901, 4661; 1911, 4691.

PERONOSPORA/CEÆ (Neo-Lat. nom. pl., from *Peronospora*, from Gk. *περόνη*, *peronē*, brooch, pin + *σπόρος*, *sporos*, seed), DOWNY MILDEWS. A family of six or seven genera of fungi belonging to the Phycomyces (q.v.) and parasitic upon higher plants such as tomato, potato, grape, lettuce, etc., which from the abundance of their aerial conidia give an appearance of whitish down on the attacked leaves. Hence the popular name. Their mycelium pene-

trates every part of the host, and warm moist weather favors their growth. The principal genera are represented by potato rot (*Phytophthora*), grape mildew (*Plasmopara*), and mildews of peas, beans, spinach, etc. (*Peronospora*).

PEROSI, pá-rō'zē, LORENZO (1872-). An Italian organist and composer of sacred music, born in Tortona. The greater part of his musical education was obtained at the Milan Conservatory, and in 1894 he attended Haberl's Domchorschule at Regensburg. Meanwhile he had studied for and been admitted to the priesthood. He was appointed maestro di cappella at Imola in 1895 and in 1897 at San Marco in Venice. In 1897 he produced a sacred trilogy, *La passione di Cristo*, which made him famous throughout Italy and secured him the signal honor of appointment to be conductor of the Pontifical Chorus at the Sistine Chapel. Other compositions include: *La trasfigurazione del nostro Signore Gesù Cristo* (1898); *La risurrezione di Lazaro* (1898); *Il natale del Redentore* (1899), *Moses* (1901); *Il giudizio universale* (1903); *Transitus Animæ* (1907); *In Patris Memoriam* (1910); a requiem and about 25 masses; a set of variations for orchestra; and numerous compositions for organ.

PÉROUSE, pá'rōōz', LA. A French navigator. See LAPÉROUSE.

PEROWNE, pe-rōun', JOHN JAMES STEWART (1823-1904). A British prelate and author, born at Burdwan, Bengal, where his father was a missionary of the Church Missionary Society. He was educated at Corpus Christi College, Cambridge, graduated (1848) as Tyrwhitt Hebrew scholar, and in the same year became a priest in the Church of England. He lectured on divinity at King's College, London, and in 1875 was appointed honorary chaplain to the Queen and Hulsean professor of divinity. A member of the Old Testament Revision Committee (1870-84) and Bishop of Worcester (1890-1901), he edited the *Cambridge Bible* (and *Greek Testament*) for Schools and Rogers on the *Thirty-Nine Articles*, and wrote: *The Book of Psalms: A New Translation* (1864); *Immortality* (1868), the Hulsean lectures; and an elementary Arabic grammar, *Al Adjrumiieh*.

PEROXIDASE. See OXIDASE.

PEROXIDE OF HYDROGEN. See HYDROGEN; HYDROGEN DIOXIDE; OXYGEN, IN MEDICINE.

PERPENDICULAR (Lat. *perpendicularis*, vertical, from *perpendiculum*, plumb line, from *per*, through + *pendere*, to hang). A line is said to be perpendicular to another line when it makes a right angle with it. A line is said to be perpendicular to a plane when it makes a right angle with every line in the plane passing through the point of intersection. One plane is said to be perpendicular to another when their dihedral angle (see ANGLE) is a right angle. See NORMAL.

PERPENDICULAR STYLE. The name given to the style of Gothic architecture in England which succeeded the Decorated style. It prevailed from the last quarter of the fourteenth century to the middle of the sixteenth and was thus contemporary with the Flamboyant (q.v.) style in France. While, however, the Flamboyant is distinguished by the flowing lines of its tracery, the Perpendicular is remarkable for the stiff and rectilinear lines from which its name was derived. The vertical lines of the window tracery are multiplied and emphasized,

and the mullions are frequently crossed by horizontal bars. The windows are made as large as possible and usually terminated above with the four-centred arch. The moldings are usually thin and hard and present in their shallow recesses and meagre lines a great contrast to the deep shadows and bold moldings of the earlier styles. Decorative tracery is carried over the wall surfaces, and minute crenelations, treated as pure ornaments, form the favorite parapet decoration and cresting. The art of masonry was well understood during the Perpendicular period, and the vaulting was admirably built. Fan vaulting (q.v.) belongs to this style. Doorways are commonly framed in above by a square inclosure formed by a heavy drip molding, with spandrels containing shields, quatrefoils, etc. There are many well-known buildings of this style, especially among the colleges at Oxford and Cambridge, and in almost every cathedral and church of importance there are some specimens of it. The most notable examples are the chapel of King's College at Cambridge, that of St. George at Windsor, and that of Henry VII at Westminster. Open timber roofs are among the peculiar and beautiful features of the architecture of this period. The roof of Westminster Hall, built by Richard II, was the largest example ever erected. Consult the authorities referred to under EARLY ENGLISH.

PERPET'UA, SAINT. See FELICITAS, SAINT.

PERPETUAL MOTION (Lat. *perpetualis*, permanent, universal, from *perpetuus*, continuous, universal, from *per*, through + *petere*, to seek). Under the name of perpetual motion is understood a mechanism which of and for itself, without outside aid, would continue to operate until it wore out. A water wheel under Niagara is not such a machine, because it is the sun which makes the wheel go by raising the water. Such a machine is incompatible with the principle of the conservation of energy, for some energy would always be converted into heat by friction and this would ultimately stop the machine unless its equivalent were supplied from somewhere. The most varied attempts have been made to disregard this principle and construct such a machine. A large class is that which includes all possible combinations of levers and wheels and worms and pumps, and which invariably reduces to the possibility of a man lifting himself by his boot straps. Many have tried to employ magnetism in some way. The forces of capillarity and gravitation have been harnessed in the most roundabout ways, but whatever means or agents are employed the aspect of the situation cannot be changed. See **ENERGETICS**.

PERPETUITY (Lat. *perpetuitas*, continuity, from *perpetuus*, continuous, universal). In a general and inexact sense such a limitation of property as suspends the full ownership and power of disposition beyond the period allowed by law. Properly the "rule against perpetuities" is a common-law rule forbidding the creation of future interests in real or personal property, subject to such contingencies that they may not become vested within a reasonable limited time, arbitrarily fixed by law. It is, therefore, a rule against remoteness of vesting, designed to prevent indefinite control of property by a present owner, by means of provisions in a will or deed to take effect after his death. However, through a misconception of the original object of the rule, the same name has also been applied to

laws prohibiting the suspension of the absolute power of alienation of property for a prescribed period.

By the early English law a man might create future interests in his property as remainders to take effect upon the termination of one or more precedent estates for life or in fee tail. Such dispositions were not in general objectionable on the ground of remoteness, for the reason that if they followed a present fee tail or if they were contingent they were destructible at the will of the tenant in possession. But the invention of uses (q.v.) of land and the practice which grew up of creating future estates not restricted, as remainders were, by dependence on a precedent estate for life or in tail, rendered it possible to create estates to take effect on a contingency at a remote time in the future, either as a springing or a shifting use or an executory devise, which were not, like contingent remainders, destructible by the tenant in possession. Thus, a person might devise an estate to the first of his descendants who should take holy orders; or to A and his heirs so long as they should bear the name of the testator, the lands to go to a charity if A or his heirs should ever cease to bear such name. Besides making the absolute ownership of land impossible in many cases, the shifting of an estate from one person to another on a contingency that might happen at any time in the future violated the principle that an estate once settled should not be divested after a long period of enjoyment, and accordingly the rule above referred to was gradually molded by the courts to restrict the practice.

The first important case on the point was the Duke of Norfolk's Case, decided in 1685, which held that a future contingent estate not a remainder, which was to vest at the expiration of a life in being, was not objectionable as a perpetuity. The period within which springing or shifting uses or executory devises must take effect was later extended to include a gross term of 21 years, in addition to a life or lives in being. For example, if A devises property to his son B for life, remainder to his grandson C for life, and that the property then go to the eldest son of C when he shall attain the age of 21 years, the devise will be held good if C is born prior to the death of A, the testator, as the will takes effect then, and the estate will finally vest absolutely within the period prescribed by the rule, i.e., lives in being and 21 years. However, if the property is devised to B for life, and after his death to his eldest son when the latter shall marry, assuming that B has no son at the death of A, the devise is bad, because if a son is born to B, he may not marry within 21 years after the death of B, and as B is the only life in being at the time of A's death, the estate must vest within 21 years after B's death. The possibility that B's eldest son may marry within 21 years will not save the devise, as its validity is determined by the possibilities which may happen under its terms, tending to make it bad, and not by the fact that in the course of actual events the estate may become vested within the prescribed period. The same principle applies also to personal property.

The attempt of an English gentleman, Mr. Thellusson, to create an enormous fortune by directing the accumulation of the income of his property during the lives of his children, grandchildren, and great-grandchildren, led to a stat-

ute, known as the Thellusson Act (39 and 40 Geo. III, c. 98), which forbids the accumulation of income for a longer time than the life of the grantor or settler, or for 21 years from the time of his death.

The English common-law rule against perpetuities above stated is still the law there and in most of the United States. However, in several States the common-law rule has been radically altered by statute so as to forbid a suspension of the absolute power of alienation for a longer period than two lives in being and 21 years. In New York the statute fixes the period at two lives in being and a period of a minority, as distinguished from a gross term of 21 years. For a more comprehensive treatment of the subject, see Gray, *Rule against Perpetuities* (2d ed., Boston, 1906); also consult the authorities referred to under REAL PROPERTY.

PERPIGNAN, pār'pènyàn'. The capital of the Department of Pyrénées-Orientales, France, and a fortress of the first rank, on the Têt, 5 miles from the Mediterranean and 35 miles south of Narbonne (Map France, S., G 6). It commands the passage by the eastern Pyrenees from Spain into France and is defended on the south by a citadel and by ramparts flanked with bastions and protected by raised works. Within the walls of the citadel is a thirteenth-century chapel, now used as an arsenal. The houses are of semi-Moresque construction, and there are many evidences of Spanish influence. The Spanish cathedral of St. Jean, a massive building, begun in the thirteenth century, has elaborately decorated altars and a large nave. The belfry of St. Jacques and the Castiller (used as a military prison), on the north side of the town, with its battlements and machicolations, are interesting. The old university building contains a museum with original photographic prints by Daguerre and a city library of 35,000 volumes. Perpignan has a college, a meteorological and seismological observatory, a teachers' institute, a priests' seminary, a girls' industrial school, a botanical garden, and is the see of a bishop. There are vineyards, olive groves, orchards, and gardens in the vicinity; manufactures of woolen cloths, paper, chocolate, corks, bells, and furs are carried on. Pop., 1901, 36,157, 1911, 39,510. Perpignan is first heard of in the tenth century. As capital of the former County of Roussillon, it remained long in the hands of the kings of Aragon and of Spain. The town was taken by the French in 1642 and united to France in 1659.

PERRAUD, pār'rô', JEAN JOSEPH (1819-76). A French sculptor, born at Monay in the Jura. He studied in Lyons and at the Ecole des Beaux-Arts in Paris under Pradier, Ramey, and Dumont and won the Prix de Rome in 1847. His work is carefully executed but thoroughly academic. His sculpture includes "Justice," in the Palais de Justice, Paris; "Lyric Drama," on the façade of the Opera House, Paris; "Day," Avenue de l'Observatoire, Paris, "The Infancy of Bacchus" and the bas-relief "Saying Farewell," both in the Louvre. He was for many years a popular teacher at the Beaux-Arts and was made Officer of the Legion of Honor in 1867.

PERRAULT, pār'rô', CHARLES (1628-1703). A French critic, best known for his *Mother Goose Stories*, the classic nursery tales of France. He was born Jan. 12, 1628, in Paris and was prepared for the bar, but soon turned to letters, winning distinction and an election to the Academy through his verses and the

patronage of Colbert, who made him head of the Royal Bureau of Architecture. He achieved notoriety in 1687 by a poem on *Le siècle de Louis le Grand*, which praised new writers at the expense of the old and so brought on the controversy between the ancients and moderns. Attacked by Boileau-Despréaux (q.v.), he defended himself in a series of dialogues, *Parallèle des anciens et des modernes* (1688-96), of more ingenuity than critical value. Better are his 200 studies of *Les hommes illustres qui ont paru en France pendant ce siècle* (1696-1701). But all these, with his *Mémoires* (1749) and two comedies, are insignificant beside the *Mother Goose Stories* (1697), through which the literary world first learned to know the *Sleeping Beauty*, *Little Red Riding-Hood*, *Blue-Beard*, *Puss in Boots*, *Cinderella*, and *Tom Thumb*, which, with Madame d'Aulnoy's *Goldilocks* and Madame de Beaumont's *Beauty and the Beast* and *Prince Darling*, form an indispensable part of the world's nursery library. Perrault published these stories under the name of his son, Pierre Perrault d'Armancoeur, and called them *Histoires ou contes du temps passé*, with the subtitle *Contes de ma mère l'Oye*. Perrault no more invented his stories outright than the Grimm brothers did theirs, nor did he intend to make a contribution to the knowledge of folklore. He drew on oral tradition, but he treated his matter in French fashion and set off fairly fancies with touches of playful realism.

There are many editions of Perrault's *Contes*. The best is probably that of Andrew Lang, *Popular Tales* (London, 1888), with a careful introduction of 115 pages. Consult also Deulin, *Contes de ma mère l'Oye avant Charles Perrault* (Paris, 1879).

PERRAULT, CLAUDE (1613-88). A French architect, born in Paris. He became a doctor of medicine, but later turned to architecture, designing, among many works, the eastern façade of the Louvre quadrangle, including its famous colonnade (completed, 1674), his design being substituted for that of Bernini (q.v.) after work had been begun upon the latter; the southern façade of the Louvre; the Observatory of Paris; and an arch of triumph at the gate of Saint-Antoine (destroyed in 1716). Perrault wrote: *Deux livres d'architecture de Vitruve, corrigés et traduits nouvellement en français* (1673); *Ordonnance des cinq espèces de colonnes selon la méthode des anciens* (1683; Eng. trans. by John James, *A Treatise of the Five Orders of Columns in Architecture*, 1708).

PERRENOT, pār'nô', ANTOINE, LORD OF GRANVELLE. See GRANVELLE.

PERRENS, pār'ràn', FRANÇOIS TOMMY (1822-1901). A French historian, born at Bordeaux. He received his early education in his native place and was a pupil at the Ecole Normale from 1843 until 1846, when he went to teach at Bourges, then at Lyons (1847) and at Montpellier (1850). From 1853 he was professor at the Bonaparte Lyceum, Paris, and he was inspector of the Academy from 1873 until his retirement in 1891. The thesis *Jérôme Savonarole* (1854), which he wrote for his degree (doctor of letters), was crowned by the Academy, and he published also: *Etienne Marcel et le gouvernement de la bourgeoisie au XIV^{ème} siècle* (1880); *Les mariages espagnols sous le règne de Henri IV* (1869); *La démocratie en France au moyen âge* (1873); *Histoire de Florence jusqu'à la domination des Médicis* (1877-84); *Histoire de Flor-*

ence depuis la domination des Médicis jusqu'à la chute de la république (1888-90); *La civilisation florentine du XIII^e au XVI^e siècle* (1893); *La littérature française au XIX^e siècle* (1899).

PERRERS, pĕr'ĕrz, ALICE (called also DE WINDSOR) (?-1400). The mistress of Edward III of England. She is said to have been the daughter of Sir Richard Perrers of Hertfordshire and probably married William de Windsor in 1376. She acquired her influence over the King during the lifetime of Queen Philippa, to whom she was lady of honor. The King made her valuable presents, but she became engaged in constant disputes with the courts in her endeavors to acquire maintenance and landed property, and she also used her influence politically to overthrow her enemies or uphold her favorites. She was sentenced to banishment by Parliament, but the decree was not enforced. After Edward's death her sentence of banishment was confirmed by Richard II's first Parliament, but was revoked in the following year, and she subsequently regained favor at court. Her quarrels with the abbey of St. Albans led to scurrilous attacks on her character by the monastic chroniclers, but she is praised by the historians Barnes, Carte, and Cotton and has never lacked defenders. See EDWARD III.

PERRET, FRANK ALVORD (1867-). An American volcanologist. He was born at Hartford, Conn., and was educated at the Brooklyn (N. Y.) Polytechnic Institute. In 1886 he became an assistant in Edison's East Side Laboratory and later invented the Perret electric motor. Taking up volcanology in 1904, he became an honorary assistant to Professor Matteucci (q.v.) in the observatory on Mount Vesuvius, Italy, where he witnessed the eruptions of 1906. He was present at the eruption of Stromboli in 1907, visited Messina after the earthquake in 1908, and saw the eruptions of Teneriffe in 1909 and Mount Etna in 1910. In 1911 he directed the expedition of the Massachusetts Institute of Technology to the Hawaiian Islands, where he lived beside the crater of Kilauea during the summer of that year. In 1913 he was burned by lava, though not seriously, while studying the volcano of Sakura-Jima, Japan. His main headquarters after Matteucci's death, as before, was Naples.

PERRIER, (JEAN OCTAVE) EDMOND (1844-). A French zoölogist, born near Tulle (Corrèze). In 1867 he became professor in the Lycée d'Agen, in 1872 maître de conférence at the Ecole Normale in Paris, in 1876 professor of zoölogy at the Museum of Natural History, and later director of the Museum. He became president of the section of natural science in the Ecole Pratique des Hautes-Etudes. In 1892 he was elected to the Académie des Sciences. Perrier suggested certain new nomenclatures in morphology—mérie, zoide, and dème. He published *Les colonies animales et la formation des organismes* (1881; 2d ed., 1898); *Les principaux types des êtres vivants, etc.* (1882); *La philosophie zoölogique avant Darwin* (1884); *Éléments de zoölogie* (1886; 8th ed., 1899); *Traité de zoölogie* (1892-1903); *La vie des animaux illustrée* (1903-06); *La femme dans la nature et l'évolution du sexe féminin* (1908).

PERRIN, BERNADOTTE (1847-). An American classical scholar, born at Goshen, Conn. He graduated at Yale in 1869 and was a student at the universities of Leipzig and Berlin

(1876-79). From 1881 to 1893 he served as professor of Greek in Western Reserve University and then went to Yale to occupy a similar chair. At this institution he held the Lampson professorship of Greek literature and history from 1901 to 1909. In 1896 he was elected president of the American Philological Association. His published works include an edition of *Cæsar's Civil War* (New York, 1882); *Homer's Odyssey* (i-iv, Boston, 1889; v-viii, ib., 1894); *Plutarch's Lives of Themistocles and Aristides*, translated with introduction and commentary (New York, 1901), and of *Plutarch's Lives of Nicias and Alcibiades* (New York, 1912). In 1915 he published the first two volumes of a 10-volume translation of Plutarch in the Loeb Classical Library. He was also joint editor of the "Twentieth Century Series of Text-Books."

PERRIN, FRANÇOIS NICOLAS AUGUSTIN FEYEN-. See FEYEN-PERRIN, F. N. A.

PERRIN, pĕr'ân', JEAN (1870-). A French physicist, born at Lille. He taught at the Ecole Normale Supérieure at Sèvres and became lecturer in physical chemistry in the Faculty of Sciences, Paris. Perrin was visiting French professor at Columbia in 1913 and was awarded the honorary degree of doctor of science. He wrote: *Sur les rayons cathodiques et les rayons X* (1897); *Cours de chimie physique* (1903); *Recherches sur les colloïdes et l'électrisation de contact* (1905); *Recherches sur le mouvement brownien et la détermination des poids absolus des molécules* (1909; Eng. trans. by F. Soddy, *Brownian Movement and Molecular Reality*, London, 1910); *Les atomes* (4th ed., 1914), translated into English and German.

PERRINE, pĕr-rin', CHARLES DILLON (1867-). An American astronomer, born at Steubenville, Ohio. He went to California in 1886, served as secretary (1893-95), assistant astronomer (1895-1905), and astronomer (1905-09) at the Lick Observatory, was a member of eclipse expeditions to Georgia (1900), Spain (1905), and Flint Island (1908), and had charge of the Lick expedition to Sumatra in 1901. In 1909 he became director of the Argentine National Observatory. Perrine is known particularly for his discovery in 1901 of the extraordinary motion in the nebulosity about the New Star in Perseus and also for his discovery of the sixth and seventh satellites of Jupiter and of 13 comets. He received the Lalande prize and gold medal from the French Academy of Sciences in 1897.

PER'IS, GEORGE HERBERT (1866-). An English publicist, born in Liverpool, the son of a clergyman. When 17 he went into journalism and in 1885 became editor of the *Hull Express*. After 10 years on the editorial staff of the *Speaker* (London) he was editor of *Concord* (1898-1906) and foreign editor of the *Tribune* (1906-07) and of the *Daily News* (1908-10). He was a prominent pacifist and a founder of the Anglo-German and Anglo-Russian friendship committees. He wrote: *The Eastern Crisis and British Policy* (1897); *Leo Tolstoy, the Grand Mujik* (1898); *A History of the Peace Conference at The Hague* (1899); *Life and Teaching of Tolstoy* (1901); *Blood and Gold in South Africa* (1902), an answer to Conan Doyle; *Russia in Revolution* (1905); *Short History of War and Peace* (1911); *Germany and the German Emperor* (1912); *The Industrial History of Modern England* (1914); *The Campaign of 1914 in France and Belgium* (1915).

PERRON, pâr'rôn', ANQUETIL DU. See ANQUETIL-DUPERRON.

PERRONE, pâr-rô'nâ, GIOVANNI (1794-1876). An Italian theologian. He was born at Chieri in Piedmont and, after completing his education with the doctor's degree in theology at the University of Turin, he was (in 1815) one of the first to enter the Society of Jesus after its reestablishment. He was professor of dogmatics at Orvieto, and from 1833 to 1848 at the Roman College. At the outbreak of the Revolution in the latter year he took refuge in England, but returned to his professorship when order had been restored, and became rector of the college in 1853. He acquired a reputation for great theological learning, was theologian to several of the Roman congregations, and had an important share in the condemnation of Hermetism (see HERMES, GEORG) and in formulating the doctrine of the Immaculate Conception. His most famous work is *Prælectiones Theologicæ* (9 vols., 1835-42). A compendium in two volumes has been published in 47 editions. Some of the most important of his many works are: *De Immaculato B. V. Mariæ Conceptu* (1847); *Il protestantismo e la regola di fede* (1853); *De Domini Nostri Jesu Christi Divinitate* (1870); *De Romani Pontificis Infallibilitate* (1874).

PERRONET, EDWARD (1721-92). An English hymn writer. He was born at Sundridge, Kent, a son of Vincent Perronet (q.v.). He became an itinerant preacher under the Wesleys in 1749, but the publication of *The Mitre* (1757), a bitter satire on the Church of England, caused a rupture and he joined Lady Huntingdon's connection in 1771. He left it shortly after and became minister of a small independent chapel at Canterbury, where he died. He is remembered as the author of the hymn "All hail the power of Jesus' name," which first appeared anonymously in the *Gospel Magazine* (1780). Collections of his hymns and poems have been published. Consult the article by Grosart in John Julian, *Dictionary of Hymnology* (rev ed., New York, 1907).

PERRONET, pâr-rô'nâ', JEAN RODOLPHE (1708-94). A French engineer and bridge builder, born at Suresnes (Paris). In 1747 he was appointed director of the Ecole des Ponts et Chaussées and he served as inspector general of harbors from 1757 to 1786. With Hippeau, whom he succeeded in 1763 as chief royal engineer, Perronet began the construction of the great bridge at Orléans in 1748. He designed bridges at Nemours, Nantes (1764), Nogent-sur-Seine (1766), and, at Paris, the Pont de Neuilly and the Pont Louis XVI (1786), now the Pont de la Concorde. Consult his *Description des projets de la construction des ponts de Neuilly, de Nantes, d'Orléans, et autres* (3 vols., 1782-80). Perronet had charge also of the construction of the Burgundy Canal and of the great sewerage system of Paris.

PERRONET, VINCENT (1693-1785). An English clergyman. He was born in London, of Swiss-French descent; was educated at a school in the north of England and at Christ College, Oxford, where he graduated in 1718; he took orders in the Church of England and became curate in the Parish of Sundridge, Kent. Nine years later he received the vicarage of Shoreham, which he retained for over half a century. He identified himself with the Methodist movement to such an extent that Charles Wesley

called him "the archbishop of Methodism." Perronet wrote several works in defense of the Methodists, also two in vindication of John Locke.

PERRROT, pâr'rô', GEORGES (1832-1914). A French archaeologist, born in Villeneuve-Saint-Georges (Seine-et-Oise) and educated at the normal school and the French school at Athens. In 1861 he went on an archaeological expedition to Asia Minor, in 1875 became professor of archaeology in the Sorbonne, and in 1889 director of the higher normal school. Later he was chosen permanent secretary of the Academy of Inscriptions. The most important fruit of his first journey in Asia Minor was the reconstruction of the text of the *Monumentum Ancyranum*. The results of his study of inscriptions appeared as *Exploration archéologique de la Galatie et de la Bithynie* (1862-72). With Chipiez he wrote the valuable *Histoire de l'art dans l'antiquité* (1882 et seq.); at the time of his death he was working on volume xi. Alone he wrote, apart from contributions to reviews and especially to the *Revue Archéologique*, of which he became an editor, *Essai sur le droit public et privé de la république athénienne* (1867), *Les peintures du Palatin* (1872); *Mémoires d'archéologie, d'épigraphie et d'histoire* (1875); *Lettres de Grèce* (1908).

PERRROT, SIR JOHN (c.1527-92). An English general, Lord Deputy of Ireland. He was born at Harroldston and was probably a natural son of Henry VIII. He was made a Knight of the Bath by Edward VI, and under Mary was imprisoned for his Protestant sympathies. Elizabeth, in 1570, made him President of Munster, and with much bravery and energy, but little prudence or tact, he attempted to establish the English crown in Munster. In 1584 he was appointed Lord Deputy to carry out the work throughout all Ireland. Under his rule the western province was pacified, but in the north he was quite unsuccessful. In 1588 he was removed from office, charged with treasonable offers to Philip of Spain and with contemptuous speech in regard to the Queen. The first charge was entirely groundless, but on the latter count he was clearly guilty and he was condemned. He died in the Tower before the sentence could be carried out. His natural son, SIR JAMES PERRROT (1571-1637), was a prominent member of the Addled Parliament (q.v.).

PERRY. A city in Dallas Co., Iowa, 34 miles northwest of Des Moines, on the Chicago, Milwaukee, and St. Paul and the Minneapolis and St. Louis railroads (Map: Iowa, C 3). It is situated in a rich agricultural district and has manufactures of washing machines, tiling spades, cement blocks, etc. It is the seat of Jones College and has a Carnegie library. The water works are owned by the municipality. Pop., 1900, 3986; 1910, 4630.

PERRY. A village in Wyoming Co., N. Y., 56 miles by rail southwest of Rochester, on the Buffalo, Rochester, and Pittsburgh Railway (Map New York, B 5). It contains a public library, fine municipal and high school buildings, and a Masonic temple. Among the industrial establishments are knitting mills and a cutlery factory. The water works are owned by the village. Pop., 1900, 2763; 1910, 4388; 1915 (State census), 5009.

PERRY. A city and the county seat of Noble Co., Okla., 30 miles north-northeast of Guthrie, on the Atchison, Topeka, and Santa Fe

and the St. Louis and San Francisco railroads (Map: Oklahoma, D 2). It is important principally as a commercial centre, being the distributing and shipping point for an extensive farming and stock-raising district. It has a large flour mill. There are public parks and a Carnegie library. The water works and electric-light plant are owned by the city. Pop., 1900, 3351; 1910, 3133.

PERRY, ARTHUR LATHAM (1830-1905). An American economist, born at Lyme, N. H. He graduated at Williams College in 1852 and was professor of history and political economy there from 1853 to 1891, when he became professor emeritus. He advocated free trade. Among his publications are: *Political Economy* (1865; 22d ed., 1895); *International Commerce* (1866); *Introduction to Political Economy* (1877; new ed., 1890); *Principles of Political Economy* (1891); *Williamstown and Williams College* (1900). He was the father of Bliss Perry.

PERRY, BLISS (1860-). An American editor, author, and university professor, born at Williamstown, Mass., Nov. 25, 1860. He graduated at Williams College in 1881, was an instructor there for five years, studied in Germany at Berlin and Strassburg, and served as professor of English at Williams (1886-93). From 1893 to 1899 he occupied a similar position at Princeton, and thereafter for 10 years he was editor of the *Atlantic Monthly*. In 1906 he accepted the professorship of belles-lettres at Harvard, a chair formerly filled by Longfellow and Lowell. Professor Perry edited *Selections from Burke*, *Scott's Ivanhoe* and *Woodstock*, and *Little Masterpieces*, 18 volumes. He was, too, the general editor of the Cambridge editions (1905-09) of the poets; and he published several works of fiction, *The Broughton House* (1890), *Salem Kittredge* (1894), *The Plated City* (1895), and *The Powers at Play* (1899); also the chapter on poetry in *Counsel upon the Reading of Books* (1900); *A Study of Prose Fiction* (1902); *The Amateur Spirit* (1904), essays; *Walt Whitman* (1906); *Whittier* (1907); *Park Street Papers* (1908); *The American Mind* (1912); *Thomas Carlyle: How to Know Him* (1915). Professor Perry received honorary degrees from several American colleges and became a member of the American Academy of Arts and Letters. His father was Arthur Latham Perry.

PERRY, EDWARD DELAVAN (1854-). An American Greek scholar, born in Troy, N. Y. He graduated in 1875 at Columbia, to which he returned in 1880 as a member of the faculty, after study at Leipzig and Tübingen. From 1891 to 1895 he was professor of Sanskrit at Columbia, and subsequently Jay professor of Greek, in 1902-09 serving also as dean of the faculty of philosophy. He held the presidency of the New York Society of the Archaeological Institute of America in 1897-1900 and in 1903-10. An authority on the subject of Greek dialects and inscriptions, Professor Perry is known also as the author of a *Sanskrit Primer* (3d ed., 1902) based on Bühler's *Leitfaden*.

PERRY, JOHN (1669-1732). An English engineer, born at Rodborough, Gloucestershire. By 1693 he had become a lieutenant in the Royal Navy on the *Montague*, and later he commanded the fire ship *Cygnet*, for losing which to the French he was court-martialed. He entered the employ of Czar Peter in 1698, engaged in canal construction between the rivers Volga and Don, in 1701 became Comptroller of the Russian Mari-

time Works, and in 1712, after a dispute regarding salary, which ended in Perry's life being threatened by Peter, he returned to England. His greatest engineering feat was the stopping of the breach in the Thames embankment at Dagenham in 1714-19 at a cost of more than £40,000. Perry published: *Regulations for Seamen* (1694); *State of Russia under the Present Czar* (1716); *An Account of the Stopping of the Dagenham Breach* (1721); *Proposals for Draining the Fens in Lincolnshire* (1727). Consult Samuel Smiles, *Lives of the Engineers* (new ed., London, 1904).

PERRY, JOHN (1850-). An English physicist and engineer. He was born in Ulster, Ireland, and was educated at Queen's College, Belfast. He was appointed professor of engineering in the Imperial College, Tokyo, Japan, in 1875, and, two years after his return to England, professor of engineering and mathematics in the Finsbury Technical College. This position he left after 15 years in 1896, and was appointed professor of mechanics and mathematics in South Kensington Royal College of Science. He became a member of the South African University Commission in 1914. Perry wrote: *The Steam Engine* (1874); *Practical Mechanics* (1883); *Spinning Tops* (1890); the Cantor lectures, *Hydraulics* (1892); *Calculus* (1897); *Applied Mechanics* (1897); *Steam* (1899); *Practical Mathematics* (1899); *England's Neglect of Science* (1901); *The Steam Engine and Gas and Oil Engines* (1902; new ed., 1909); *Elementary Practical Mathematics* (1913); besides many contributions to English scientific periodicals.

PERRY, MATTHEW CALBRAITH (1794-1858). An American naval officer, brother of Oliver Hazard Perry (q.v.). He was born at Newport, R. I., entered the navy as a midshipman in 1809, and early in the War of 1812 was one of the officers of the frigate *President*. In 1813 he was transferred to the *United States*, which was blockaded in the harbor of New London until the conclusion of peace. He was then for several years engaged in the merchant service, but, having reentered the navy, he was in 1819 appointed executive officer of the *Cyane*, which convoyed the *Elizabeth* with her band of pioneers to Liberia. Two years later he was again on the African coast as commander of the *Shark*, and recommended the removal of the Liberian colonists from Sherbro to Monrovia. On his return from this voyage, and again in 1822, he took an active part in extirpating piracy in the West Indies. In 1824 he was appointed executive officer of the *North Carolina*, Commodore Rodgers's flagship on the Mediterranean station. He was promoted to the rank of commander in 1826, and in 1832 was again sent to the Mediterranean as captain of the *Concord*. From 1833 to 1843 he was stationed at the Brooklyn Navy Yard. Under his superintendence was built the *Fulton* (the second of the name), a paddle wheel steamer of about 1200 tons, and the first steam vessel with a hull of ordinary type built for the United States navy. When she was completed in 1837 he took command of her, organized her personnel, and so thoroughly demonstrated the practical utility of steam as a motive power for war vessels that he earned the title of Father of the Steam Navy. In this same year he was commissioned captain and in 1839 was sent abroad to study the latest English and French steam warships. In 1841 he was promoted to be commodore and two years later was

assigned to the command of the squadron on the African coast maintained by the United States for the suppression of the slave trade. During the early part of the Mexican War he served under Commodore Conner in the Gulf, but on Conner's recall in 1847 Perry succeeded him in the command of what was then the largest fleet of warships ever assembled under the American flag. In 1852 he was sent by President Fillmore with a squadron of warships to Japan to induce that country to enter into relations with the nations of the West. His flagship, the *Mississippi*, was the first United States steam war vessel to circumnavigate the globe. He arrived in Kurihama, in the Bay of Yeddo, on July 7, 1853, and on the 14th delivered to representatives of the Shogun the letter addressed to the ruler of Japan, which declared the nature of his mission. He then went to China, and returning in February, 1854, concluded a treaty with the Japanese by which they agreed to receive an American consul at one of their ports. This treaty, which was followed by one between Japan and Great Britain, inaugurated a new era in the history of Japan. Perry's report was printed by the government in three volumes, under the title *The Report of Commodore Perry's Expedition to Japan* (1856). He died in New York City in 1858. A monument to his memory was unveiled at Perry Park, Kurihama, Japan, on July 14, 1901. Consult W. E. Griffis, *Matthew Calbraith Perry, a Typical American Naval Officer* (Boston, 1887).

PERRY, NORA (1841-96). An American poet, journalist, and writer of juvenile stories, for some years Boston correspondent of the *Chicago Tribune*. She was born in Dudley, Mass. Her verse is collected in *After the Ball* (1875), *Her Lover's Friend* (1879), *New Songs and Ballads* (1886), *Legends and Lyrics* (1890). Her fiction, chiefly juvenile, includes *The Tragedy of the Unexpected* (1880), stories, *For a Woman* (1885), a novel; *A Book of Love Stories* (1881), *A Flock of Girls and their Friends* (1887); *The New Year's Call* (1903); and many other volumes. These are briskly told and, like her verses, appeal to the sentiment of the broader reading public.

PERRY, OLIVER HAZARD (1785-1819). A distinguished American naval officer. He was born at South Kingston, R. I., Aug. 23, 1785, and received his education partly from his mother and partly in private schools in Newport and elsewhere. He entered the navy as a midshipman in 1799, served in the war against Tripoli, and in 1807 was commissioned lieutenant. In 1811, as commander of the schooner *Revenge*, he had the misfortune to lose his vessel off Watch Hill, R. I., but a court of inquiry, which at his request investigated the circumstances connected with the wreck, reported him guiltless of any neglect of duty. During the first few months of the War of 1812 Perry commanded a flotilla of gunboats in Newport harbor, but was later transferred to Sacketts Harbor, N. Y., and thence was soon ordered to Presque Isle (now Erie) to take charge of the construction of a fleet, with which the Americans hoped to wrest from the British the control of Lake Erie. By great exertions he succeeded by the end of the summer of 1813 in building and manning a squadron of nine vessels, with which, on the 10th of September, he won the celebrated battle of Lake Erie. His dispatch announcing the victory ran: "We have met the enemy and

they are ours. Two ships, two brigs, one schooner, and one sloop." (See *ERIE, BATTLE OF LAKE*) He was then able very materially to assist General Harrison in the operations culminating in the battle of the Thames. As a reward for his brilliant victory Perry received from Congress a vote of thanks, a gold medal, and the rank of captain. By the people he was regarded as one of the chief heroes of the war, and his achievement has remained one of the favorite episodes in American history. Later a bitter controversy arose between Perry and Elliott, the commander of the *Niagara*, one of Perry's vessels, over the question whether Elliott did his duty in supporting the flagship. A court of inquiry, called at Elliott's request, made a somewhat ambiguous report. Subsequently Perry preferred charges, but no action was ever taken by the Navy Department. After the close of the war Perry was placed in command of the frigate *Java* and cruised with Decatur's squadron in the Mediterranean. In 1819 he was sent with a small squadron to the West Indies to protect American commerce against pirates. While performing this duty he was seized with yellow fever and died the same year on his birthday. He was buried with military honors at Port of Spain, Trinidad, but in 1826, by order of Congress, his body was removed in the sloop of war *Lexington* to Newport, where it was reinterred with great honors. The State of Rhode Island later erected a granite monument to his memory, and there are also statues of him at Newport and at Cleveland, Ohio. In 1913 the centennial of the battle of Lake Erie was celebrated in notable style. An elaborate memorial structure was unveiled at Put-in-Bay. In this were reinterred the bones of American and British officers who fell in the fight. Cleveland and Newport had their own celebrations. Books descriptive of these occasions were published. Consult: J. F. Cooper, in *Lives of Distinguished American Naval Officers*, vol. II (New York, 1846), James Barnes, *The Hero of Erie* (ib., 1898); O. H. Lyman, *Commodore O. H. Perry and the War on the Lakes* (ib., 1905); A. S. Mackenzie, *Commodore Oliver Hazard Perry* (Akron, Ohio, 1910).

PERRY, PETER (1793-1851). A Canadian statesman. He was born in Lennox County, Ontario, and in early life was a farmer, later becoming a merchant at Whitby. His sympathy with the agitation for reform led him to enter politics, and he was one of the earliest advocates of responsible government. He was one of the founders of the Reform party of Upper Canada in 1824 and Reform (Liberal) member for the united counties of Lennox and Addington in 1824-36 in the Upper Canada Legislative Assembly. After the union of Upper and Lower Canada in 1841 Perry contended vigorously for responsible government in the new Province of Canada and was elected a Liberal member of the Canada Legislative Assembly. Dissatisfied with the methods of the Reform party then in power, he advocated a more radical platform and was one of the founders of the Clear Grit, or Advanced Reform, party, which included certain principles that the more moderate Reformers rejected. He sympathized to some extent with the annexation movement in 1849, but recognized that it was impracticable.

PERRY, RALPH BARTON (1876-). An American philosophical scholar, born at Poultney, Vt. He was educated at Princeton (A.B.,

1896) and at Harvard (A.M., 1897; Ph.D., 1899), where, after teaching philosophy for three years at Williams and Smith colleges, he was instructor (1902-05), assistant professor (1905-13), and professor of philosophy. A pupil of William James, whose *Essays in Radical Empiricism* he edited (1912), Perry became one of the leaders of the neorealist movement. (See REALISM.) His own writings include: *The Approach to Philosophy* (1905); *The Moral Economy* (1909); *Present Philosophical Tendencies* (1912); *The New Realism* (1912).

PERRY, ROLAND HINTON (1879-). An American sculptor and painter. He was born in New York and studied painting at the Art Students' League in that city and afterward under Gérôme in Paris. He then turned to sculpture, which he studied in Paris under Chapu and Pucch. His early plastic work, such as "Siegfried and the Dragon" and the "Fountain of Neptune," the latter in front of the Congressional Library, Washington, are vigorous and effective, though florid and carelessly executed. His later works show greater finish and skill in composition. Among the best known are: "The Lion in Love," "Circe" (1900); the Langdon doors, Buffalo Historical Society; frieze in the lobby of the New Amsterdam Theatre, New York; "Pennsylvania," on the dome of the capitol at Harrisburg (1904); memorial of New York State at Andersonville, Ga. (1910); equestrian statue of General Castleman, Louisville, Ky.; and General Wadsworth, Gettysburg. His busts, which are handled with breadth and charm, include that of his daughter and one of General Sickles. Perry's painting called "The Death of Sigurd" is in the Detroit Museum.

PERRY, STEPHEN JOSEPH (1833-89). An English astronomer, born in London. He studied theology at Douai and Rome, entered the Society of Jesus in 1853, and studied mathematics at Stonyhurst, at the University of London, and at that of Paris. In 1868 he began a magnetic survey of France. Two years afterward, as fellow of the Royal Society, he was stationed at San Antonio, Cadiz, to observe the total eclipse of that year, in 1874 he directed the observations of the transit of Venus on Kerguelen Island, and in 1882 was sent to southwestern Madagascar with another transit of Venus expedition. Perry died in the Salut Islands, where he caught a severe cold in attempting to photograph the total eclipse of Dec. 22, 1889. His generosity fitted up the Stonyhurst Observatory. Perry was an able and popular lecturer. In 1881 he discovered, independently of Trouvelot, the veiled sun spots. Consult A. L. Cortie, *Father Perry, the Jesuit Astronomer* (London, 1890).

PERRY, THOMAS SERGEANT (1845-). An American educator and literary historian, born in Newport, R. I. He graduated (1866) at Harvard, where, after studying in Berlin and Paris, he taught German (1868-72) and English (1877-81). In the interval he was for two years editor of the *North American Review*. He afterward wrote: *Life and Letters of Francis Lieber* (1883); *English Literature in the Eighteenth Century* (1883); *From Opitz to Lessing* (1884); *The Evolution of the Snob* (1886); *Greek Literature* (1890); *Life of John Fiske* (1906).

PERRY, WILLIAM STEVENS (1832-98). An American Protestant Episcopal bishop and educator. He was born at Providence, R. I., studied at Brown University, but took his degree from

Harvard in 1854. He studied theology at Virginia Seminary and was ordained priest (1858) at St. Paul's, Boston, where he spent the first year of his ministry. His succeeding charges were in Nashua, N. H., Portland, Me., Litchfield, Conn., and Geneva, N. Y. He taught history at Hobart College for several years and served the institution as president from April to September, 1876, when he was consecrated Bishop of Iowa. He did much for the cause of education in his diocese—reopened Griswold College, founded St. Katharine's Hall for girls, Kemper Hall for boys, and Lee Hall for training candidates for orders. He also founded St. Luke's Hospital at Des Moines. Among his writings are: *Documentary History of the Protestant Episcopal Church in the United States of America* (1863-64), with Dr. F. L. Hawks; *Historical Collections of the American Colonial Church* (5 vols., 1871-78); *Historical Notes and Documents Illustrating the Organization of the Protestant Episcopal Church in America* (1874); *Historical Sketch of the Protestant Episcopal Church, 1784-1884* (1884). Consult sketch and bibliography in his *Episcopate in America* (New York, 1895).

PERRYVILLE, BATTLE OF. A battle fought at Perryville, Ky., about 40 miles south of Frankfort, on Oct. 8, 1862, during the Civil War, between a Federal force of about 22,000 men, actually engaged, under General Buell, and a Confederate force of about 17,000 men under General Bragg. The Confederates opened the engagement at about two o'clock in the afternoon by an attack upon the Federal left under McCook, and for a time drove it back, but were finally forced back themselves through the town of Perryville. During the night the Confederates retired from the field. By many the engagement has been considered a drawn battle, though strategically it is generally regarded as a victory for the Federals. General Buell's forces in the vicinity of Perryville numbered about 58,000 men, less than half of whom were actually engaged in the battle. The Confederates lost, in killed, wounded, and missing, 3396; the Federals, 4211. Consult: J. B. Fry, *Operations of the Army under Buell* (New York, 1884); Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. iii (ib., 1887); J. C. Ropes, *The Story of the Civil War*, part II (ib., 1898); M. F. Steele, *American Campaigns* (Washington, 1909).

PER'SÆ (Lat., from Gk. Πέρσαι, Persians). A play of Æschylus, produced at Athens in 472 B.C., with three other dramas, *Phineus*, *Glaucus*, and *Prometheus*. It is notable as being the only extant ancient drama the subject of which is not mythological. Its subject is the defeat of the Persians, with a fine description of the battle of Salamis.

PERSECUTIONS OF THE CHRISTIANS, THE TEN. A phrase that has been in very general use since the fifth century. The number, however, has no basis in fact, and was suggested by the 10 plagues of Egypt and the 10 horns of the beast in the Book of Revelation (xvii. 3 et seq.), interpreted, in accordance with the allegorizing spirit of the time, as types of 10 emperors. There were only two persecutions coterminous with the Roman Empire and directly prompted by Imperial action, that under Decius in 250 and that under Diocletian and his associates, 303-313. On the other hand, if provincial and local persecutions be taken into

account, the number is far too small. So far as known, Claudius (41-54) was the first Roman Emperor to attempt any sort of persecution of the Christians. Suetonius states that he expelled the Jews from Rome. The reason is not altogether clear, but a very plausible interpretation is that, at this early date Christian converts being mainly Jews, the government regarded the former merely as a sect of the latter, and the decree was occasioned by disorders arising in the city because of conflicts between non-Christian and Christian Jews, leading to the expulsion of both. The date is uncertain; it has been placed in 52, but may have been earlier. (Cf. Acts xviii. 2.) The 10 persecutions as commonly given, with the date fixing approximately either the beginning or period of greatest severity, are: that under Nero, 64, under Domitian, 95; under Trajan, 112-113; under Marcus Aurelius, 177; under Septimius Severus, 202, under Maximinus, 235; under Decius, 250, under Valerian, 257; under Aurelian, 274, under Diocletian and his successors, 303-313.

PERSEPHONE. See PROSERPINA.

PERSEPOLIS (Lat., from Gk Περσέπολις, City of the Persians). The Greek name of the capital of the Persian Empire under Darius I and his successors. The actual Persian name of the place in antiquity is uncertain, but the city itself may possibly have been called Stakhra (strong), as Stakhr was its designation in Sassanian times, and Istakhr is still the current name applied to ruined remains north and northwest of the great platform on which stood the palaces of the Achaemenian kings, Darius Hystaspis, Xerxes, and the rest. The site of Persepolis is identified mainly through this splendid palace terrace and by the royal tombs in the vicinity. The platform itself is known by the natives as Takht 1 Jamshid (Throne of Jamshid), the legendary founder of Persepolis, or is called by them Chihal Minar (Forty Columns), the number 40 being simply a round figure to designate the remains of pillars, certain of which are still standing. There is some inscriptional evidence (Xerx Pers., a, 3, 14) to show that the platform may have been known as Pārsa, i.e., Persia par excellence.

The ruins of this past centre of Imperial greatness extend throughout the valley of the Medus above its confluence with the Araxes, or now respectively the Pulvar and Bendemeer (Pers. Pulwār and Band i Amr). They overlook the beautiful mountain-girt and fertile plain of Murghab, known as Mervdasht, north-

west of Lake Tashk or Nargis, and are located about 40 miles northeast of Shiraz, on the road to Ispahan; the small river Pulvar courses through much of the district. The ruins themselves are chiefly Achaemenian, supplemented by later monuments of the Sassanian period. The Achaemenian remains consist of (1) the grand platform of Takht 1 Jamshid, referred to above. It is situated at the south of the entire collection of ruins and adjoins the base of a hilly range in which are hewn in the solid rock three finely sculptured sepulchres, presumably those of the later Achaemenian kings, Artaxerxes II (Mnemon), Artaxerxes III (Ochus), and Darius III (Codomannus), the latter tomb having been left unfinished. (2) At various points north and northwest on the plain are vestiges of the city of Stakhra, the capital itself and abode of the people as opposed to the royal terrace, or capitol. Among the remains of this town, and belonging evidently to the Achaemenian era, are some pilasters, bases of columns, and a small granite staging, about 40 feet square and 8 feet high, which is called the Peacock Throne (Takht 1 Tā'us), or Rustam's Throne (Takht 1 Rustam), lying near the small modern posthouse at the hamlet of Puzah. In the Sassanian period Stakhr was an important metropolis, and Mohammedan writers between the tenth and fourteenth centuries of the Christian era still described it as an emporium, noteworthy for its bazars and for an ancient fire temple which had been converted into a mosque. The place was in ruins, however, when Pietro della Valle visited it in 1621. (3) North again on the plain and across the Pulvar, or at a distance of 5 or 6 miles from the platform, are hewn in the rocky face of a high perpendicular cliff four famous tombs, the sepulchres of the elder kings of the second line of the Achaemenidae, Darius I, Xerxes, Artaxerxes II, and Darius II. This necropolis hill, which has a sharp bend at its eastern end, was spoken of by Ctesias (*Frag.* 46) as a double mountain (δισσὸν ὄρος); but the natives today call it Husain Kuh (Mountain of Husain), or more commonly Naksh 1 Rustam (Rustam's Portrait), from a mistaken notion that the sculptures of historic Sassanian kings on horseback carved at its base represent Rustam and his famous steed. These tombs, which are hewn deep in the rock, have each the form of a Greek cross about 70 feet in height by 60 feet in width, and all four are identical in design. The tomb of Darius I is the second from the eastern end and is identified by a long cuneiform inscription, twice given. The other three tombs bear no inscriptional devices, but can be identified on archaeological grounds as the vaults of Xerxes and his immediate successors. Below the tombs, or along the base of the cliff, are seven carved panels, which date from a later dynasty, as they contain Sassanian bas-reliefs belonging to the third and fourth centuries A.D. These sculptures depict events connected with the reigns of known monarchs of the house of Sasan. Opposite the fourth or last tomb and distant from it about 20 yards is a well-preserved square building of stone dating back to Achaemenian times and wholly analogous in structure to the one in ruins at Pasargadae (q.v.). Local tradition calls this building a shrine of Zoroaster (ka'bah 1 Zardusht), and there are cogent reasons for regarding it as a sanctum designed for keeping the sacred fire, somewhat like the modern Parsi *sagri* that com-

monly adjoins a tower of silence; but some scholars prefer to regard it as an ancient mausoleum. (See PASARGADÆ.) On the western side of the necropolis cliff and near its lower ascent are two fire altars (*âtashgâhs*), hewn out of the living rock and dating from the Achaemenian period; while slightly above them on the slope is a simple low pillar, similarly hewn and belonging to the same era. Still farther up on the bluff are some seven roughly carved spaces, cut in the rock, three of them being particularly well defined; they all are presumed to have served as tables upon which the bodies of the dead were exposed to be devoured by dogs and birds in accordance with the tenets of the ancient Zoroastrian religion. This list of remains, when supplemented by a memorandum as to a sort of carved parapet of stone that is approached by five crudely cut steps at the top of the cliff, comprises all of the remains at Naksh i Rustam.

The other two sets of monuments, which are found on the plain and lie to the east and south-east of Naksh i Rustam, are of Sassanian origin. The first of these remains (4) is a celebrated inscription in Chaldeo-Pahlavi and Sassanian Pahlavi carved on two tablets in a cave near Hajiabad, about 2 miles east of the necropolis hill. This inscription appears to record a remarkable arrow shot by King Shahpur, or Sapor I (241-272 A.D.). The second of the set lies somewhat farther south and consists of a group of three bas-reliefs chiseled in a rocky recess at Naksh i Rajab. The effigy of King Sapor I forms the central figure in each of the three sculptures, and his name appears in Greek as well as in Pahlavi.

As previously indicated, Takht i Jamshid, or the platform proper, is the most important of all the ruins, as it formed the residence of the Great Kings. The spurs of the Mountain of Grace (*Kth i Rahmat*), at whose base it is located, have been partly cut away to furnish building material for this imposing terrace and the edifices that crown it. The vast substructure is over 1500 feet long from north to south (or more exactly northwest to southeast) by about 800 feet from east to west. Its retaining wall, composed of immense blocks of stone carefully masoned, varies in height from 20 to 50 feet above the level of the plain. Although legend points to some earlier occupation of the site as a royal centre, it is certain that the platform itself was erected by Darius I, having been begun about 518 B.C., but having probably required several years for completion. According to Diodorus Siculus (17, 71) it was surrounded by a triple wall of 16, 32, and 60 cubits respectively. Traces of these circumvallations, which must have been made of clay covered with glazed tilings, appear to have been found along the three exposed sides of the area; no protection was needed at the rear because of the natural fortification formed by the eastern hills. On the terrace itself there may likewise have been at certain points inner shielding barriers, because all evidence from the past indicates that the platform was not only a royal seat but also a citadel (*Elamit. halvarraš*, i.e., *OPers. didâ*).

The whole expanse of the terraced height shows three distinct elevations. The lowest, that to the south, presents no traces of ever having been built upon. The middle terrace is the highest, averaging possibly 45 feet above the plain and measuring approximately 800 feet square

It supports the most notable of the ruined edifices, the palace of Darius, a sumptuous audience hall of Xerxes, a palace of that same monarch, a palace of Artaxerxes III, and the impressive ruins of the so-called Hall of a Hundred Columns, together with some other remains of Imperial state. The northern terrace, somewhat lower in level than the middle elevation, is approached by the grand staircase, a magnificent flight of stone stairs running in a double ramp from the plain at the northwestern corner of the platform. The steps of this ascent are nearly 22 feet wide, 4 inches high, and 15 inches in the tread, with a mount so easy that travelers have often ascended them on horseback. Near the top of this stairway, or at some twoscore and more yards eastward on the floor of this terraced elevation, rise the grandiose remains of the Portal of Xerxes, a gateway composed of four massive pylons adorned by figures of colossal winged bulls, with human faces partly preserved, guarding the entrance and closely resembling the Assyrian bulls of Nineveh. Two of these mighty relics in stone look westward towards the plain, two eastward towards the hill; and between them are two fluted columns in situ, the remains of an original four that lent added dignity to the whole. Through this pompous entry the envoys of the subject nations, bearing tribute to their sovereign lord, passed in regal array to do homage to the Great King, Xerxes, at the spring festival of Nau-Ruz, or New Year's Day, as indicated by cuneiform inscriptions on the portal which call it the Porch of All Nations (*OPers. Duvarthi Visadahyu*). Near by are the remains of a ruined tank or cistern hewn in the stone. Passing south across a space of about 50 yards from the propyleum one encounters a long and elaborately carved frieze, adorned with sculptured figures of the tribute-bearing nations with their gifts, and inscribed with cuneiform tablets which serve to identify the work as that of Xerxes. This sculptured front served as a kind of stylobate for the lofty audience hall of this Great King. The popular name, *Chihal Minar* (Forty Columns), is but an Oriental round number, as stated above, for the original 70 pillars that composed the original throne room. Thirteen of these still remain upright. The general arrangement of the building shows that the central hall in Xerxes's time was supported by 36 columns and flanked on either side by rooms with 12 columns each. The average height of these shafts is 60 feet, the circumference 16 feet, and the length from the torus to the capital 44 feet. Each standing column of the set is finely fluted in 52 divisions; at the lower extremity begin a cincture and a torus, the first 2 inches in depth and the latter 1 foot, whence devolves the pedestal, shaped like the cup of a pendent lotus; the capitals, moreover, were probably once surmounted, as in the case of the Achaemenian pillars at Susa, by a double semibull. This great audience hall or throne room (*OPers. apadâna*) is computed to have occupied a rectangle of about 300 by 350 feet and thus to have covered two and one-half acres. The tiled walls of clay, built between the columns so as to form the edifice, have long since disappeared.

About 50 more yards southward and still near the western side of the platform are the clearly preserved remains of the palace of Darius, adorned by his effigy in bas-relief and identified by cuneiform inscriptions. South again of this

PERSEPOLIS

1. PALACE OF DARIUS

2. FIRST OF THE TOMBS OF THE KINGS

famous edifice and lying nearest of all to the edge of the rampart, on the other side of an open court, are found the ruins of the palace of Artaxerxes III (Ochus), which was probably one of the latest of the regal edifices and is known by inscriptions on the stairway. Directly back of it, to the east, stood the palace of Xerxes, noble in design even in its ruins.

Traversing eastward some 50 yards, over uneven ground, one finds a smaller building, known as the Southeast Edifice, the identity of which is not known with certainty, though the structure may have been erected by Artaxerxes II (so Sarre and Herzfeld, *Iranische Felsreliefs*, p. 109). From this point northward and directly in the rear of the palace of Darius is a ruined entrance hall, commonly known as the Portico of Darius, although sometimes called the Central Edifice, adorned by bas-relief sculptures of the Great King and of the vassal nations that supported his throne. Close to it on the right, or directly to the east of the audience hall of Xerxes described above, and of Darius' own palace, stand the remnants of the largest of all the stately pile of buildings. It is known as the Hall of a Hundred Columns and was erected by Darius I, even if his son Xerxes may have shared in completing it. In addition to these palatial structures there are found beneath the surface of the platform remains of several underground channels; but whether they were simply water ducts or else subterranean passages designed for other purposes has not yet been fully determined.

Concerning the stone of which the terrace itself and its edifices were made, it may be noted that the substance is a calcareous limestone hewn from the adjoining hill. Its surface admits of a high polish that causes it to resemble even porphyry or marble, as in the palace of Darius, or it takes on a hue of amber-like white, as in the remaining pillars of the great hall of Xerxes.

In reviewing the history of Persepolis it may be added that this royal metropolis, which owed its foundation to Darius and its development to Xerxes and his successors, passed through various vicissitudes in the course of ages. It fell before the conquering hosts of Alexander the Great, who spent some four months in its midst, early in 330 B.C. before he resumed his pursuit of Darius Codomannus, which resulted in that monarch's death. It is chronicled that before his departure from Persepolis Alexander, acting on the suggestion of the courtesan Thais, destroyed by fire the palaces of Takht i Jamshid. Charred remains of the cedar beams of the royal edifices seem to bear out the truth of this tradition. Still in 316 B.C. (Diodor. Sic., 19, 21-46) Persepolis remained the capital, but it gradually sank into a decline, even though it arose once more into prominence after 200 A.D. under the Sassanids and remained a considerable centre of administrative, religious, and commercial activity. At the time of the Moslem invasion it proved a formidable opponent to the armies of the Sword and the Crescent, but suffered severely; yet, as noted above, it enjoyed a certain prosperity down to the fourteenth century; by the sixteenth century, however, it had passed out of existence.

PERSEUS (Lat., from Gk. Περσεύς). In Grecian legend, the son of Zeus and Danaë (q.v.) and grandson of Acrisius, King of Argos. As Acrisius had been warned that he would perish by the hand of Danaë's son, he inclosed mother and child in a chest and cast them into the sea. They drifted to the island of Seriphos, where they were cared for by Dictys, brother of the King, Polydectes. The latter fell in love with Danaë, and as Perseus, now grown to manhood, interfered with his plans, he sent him to bring the head of Medusa. (See GORGON.) Guided by Athena, he found the Grææ, old women with but one eye and one tooth between them, who directed him to the nymphs, from whom he received winged sandals, a pouch, and the cap of Hades, which, like the Tarnhelm of Teutonic story, made the wearer invisible. Hermes provided him with a semitar, and Athena with a bronze shield, in which as a mirror he could see the face of Medusa without encountering her glance, which turned all living things to stone. After a long journey, which the poets gradually filled with adventures, he reached the distant home of the Gorgons, found them asleep, identified Medusa, cut off her head, and escaped by the aid of his magic helmet. On his return he rescued Andromeda (q.v.), daughter of King Cepheus of Ethiopia (variously localized in this story), and took her with him to Seriphos, where he found his mother and Dictys suppliants at the altar, for Polydectes had resorted to violence. Medusa's head turned Polydectes and his followers to stone, and Perseus sent his magic weapons to the nymphs by Hermes and gave the head to Athena, who placed it on her ægis. Perseus with his wife and mother then returned to Argos and found that Acrisius had fled to Larissa in Thessaly. Perseus followed, and accidentally killed his grandfather while throwing the discus during some games. Returning, he exchanged the rule of Argos for that of Tiryns and later founded Midea and Mycenæ. Perseus is originally the local deity of the spring Perseia by Mycenæ, as Danaë is the ancestor of the Danaans of Argolis. The slaying of Medusa and the rescue of Andromeda were favorite subjects of ancient art and are found on early vases and Pompeian wall paintings as well as in sculpture. They are catalogued and discussed by Knatz, *Quomodo Persei Tabulam Artifices Græci et Romani Tractaverint* (Bonn, 1893). Consult: E. S. Hartland, *The Legend of Perseus: A Study of Tradition in Story, Custom, and Belief* (3 vols., London, 1894-96); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911); and for the story freely told in English, William Morris, "The Doom of King Acrisius," in *The Earthly Paradise* (London, 1868). See PLATE of CELLINI, BENvenuto.

PERSEUS. A northern constellation named

after the hero of Greek mythology. It is situated to the east of Andromeda. Its principal stars are a Persei, or Mirfak (Algenib), of the second magnitude, and the famous variable β Persei, or Algol (q.v.). This constellation has been the scene of the appearance of two *novæ* or temporary stars. (See STAR.) The first of these was detected, long after it had burnt itself out, in 1895 by Mrs. Fleming on plates exposed at the Harvard Observatory in 1887. The other was discovered as a star of the third magnitude on Feb. 22, 1901, by Dr. Anderson, of Edinburgh, and after a brief and spectacular increase of brilliancy faded to its present condition of a faint telescopic star. Near χ Persei is situated the radiant of the swarm of August meteors known as the Perseids. There is a remarkable double cluster about 8° northwest of a Persei.

PERSEUS (c.212 B.C.-?). The last King of Macedonia, the eldest son of Philip V. He was born about 212 B.C. He was from his earliest years trained to a military life, and, having compassed through intrigue the death of his brother Demetrius, who was a favorite both with the Macedonians and with the Romans, and whom he for that reason regarded as a dangerous rival, he ascended the throne on the death of his father in 179 B.C. A struggle with Rome was inevitable, and Perseus was well prepared for it. His treasury and magazines were full, his army amounted to over 40,000 trained men, his alliances were strong, and he was himself popular with his subjects and neighbors. He sought, however, to postpone the inevitable as long as possible, but matters came to an open rupture in 171. In that year the consul Publius Licinius Crassus was sent against him. A blunder of the Romans saved Perseus. Crassus was defeated at Callinicus in Thessaly. But Perseus failed to follow up his victory, and the war was continued without decisive result for a number of years. Finally, in the month of March, 168, Lucius Æmilius Paulus arrived in Greece to take command of the Roman forces, and on June 22 of the same year the Macedonian army was utterly defeated in the battle of Pydna. Perseus fled, but afterward fell with all his treasures into the hands of the Romans. After gracing the triumph of the consul at Rome, he was held in captivity several years at Alba Fucens, in Italy, where he at length died. Freeman, *History of Federal Government* (2d ed., New York, 1893).

PERSHORE, pēr'shōr. A market town in Worcestershire, England, on the Avon, 7 miles southeast of Worcester (Map: England, D 4). It is noted for the church of the Holy Cross, the only remaining portion of the famous abbey founded in 970. Vegetable and fruit gardening is largely carried on, and there are manufactures of stockings and agricultural machinery. Pop., 1901, 3348; 1911, 4103.

PERSIA, pēr'shā or pēr'zhā (Lat. *Persia*, *Persis*, from Gk. Περσία, from OPers. *Pārsa*, Pers. *Pārs*, Ar. *Fārs*, Persia). A native state, largely under British and Russian spheres of influence, of southwest Asia, called by the inhabitants Iran, the name Persia (Farsistan) being applied only to a small province. It extends from lat. 25° N. (Ras Farsa, near the Baluchistan frontier) almost to lat. 40° N. (Aras River on the border of Transcaucasia) and from long.

44° E. (Armenia) to long. 63° E. (Baluchistan). A line extending northwest and southeast, nearly bisecting the country, is 1400 miles long. Its greatest north and south extent, from Ras el Kuh on the Strait of Ormuz to its most northern point on the frontier of Russian Turkestan, is 875 miles. The country is bounded on the north by Transcaucasia, the Caspian Sea, and Russian Turkestan, on the south by the Indian Ocean and Persian Gulf, on the east by Russian Turkestan, Afghanistan, and Baluchistan, and on the west by Asiatic Turkey and the Persian Gulf. It is over one-fifth as large as the United States, excluding Alaska, having an area of about 628,000 square miles.

Topography. Persia is an elevated tableland, the western half of the great Iranian plateau, from 3000 to 5000 feet in general altitude, sinking to the Caspian Sea and the plain of Turkestan along its northern frontier and to the Persian Gulf and the Mesopotamian plain at its south and west border. To reach the plateau great mountain barriers must be crossed on all sides excepting in the east, where the tableland and mountains merge imperceptibly with those of Afghanistan and Baluchistan. On the other three sides great mountain ranges stretch between the interior plateau and the narrow plains which slope to the Caspian Sea on the north and the Persian Gulf on the south and merge with the plains of Asiatic Turkey on the west. The plain of the Caspian presents a wonderful contrast to the colorless, waterless, and treeless expanse of the plateau to the south, from which it is separated by the Elburz Mountains. It comprises the maritime provinces of Mazanderan and Gilan with a rainfall of 56 inches, so that the mountain slopes are heavily forested, and in the deep alluvial soils brought down by the torrential streams there are dense swamp jungles down to the Caspian, where the salt and sand choke the vegetation. Furthermore, it possesses a degree of atmospheric humidity that is seldom found outside of the tropics. Most of the towns are among the forests on the lower slopes of the mountains. For purposes of agriculture and fruit raising this is the most favored part of Persia. Many large and small plantations have been cleared in the forests, and all the cultivated crops of south Europe, including the mulberry for silk manufacture, attain high perfection. This luxuriance of vegetable life is due to the vapor-charged clouds of the Caspian, which are brought south by the prevailing winds, the northeast trades, and, impinging upon the north slopes of the Elburz, descend in mist and rain to the lowlands.

Along the southern maritime border the mountains, low in elevation and extending east and west, often closely approach the sea, and the narrow plains between them and the ocean, situated in the rain shadow of the northeast trades, are dry and barren excepting in certain districts where the rainfall, supplemented by irrigation, suffices for agriculture. Nearly all the mountains of Persia are bleakly sterile in aspect. The most imposing of the mountain ranges is the Elburz, which, continued eastward by the Kuren Dagh, Kopet Dagh, Ala Dagh, and Binalud Kuh, stretches like a mighty mountain wall along the entire north border. The Elburz, from 10 to 30 miles south of the Caspian, may be crossed by a few passes or defiles, some of them at an elevation of over 8000 feet.

Its upland valleys, with an average elevation of about 4000 feet, are dominated by peaks rising from 8000 to 11,000 feet above the sea, and towering above them all is Demavend, an extinct volcano, 18,600 feet high, the culminating point of Persia. On the flanks of this volcano there are hot springs and fissures which emit steam, but there is neither record nor tradition of its eruption. Its crater, visited by Sven Hedin in 1890, was reported as snow-covered. In the western part of the Elburz is the peak Savalan, 15,792 feet. The wide mountain lands of west Persia extend in many parallel ranges throughout the whole of that part of the country overlooking the valley of the Tigris and the Persian Gulf. Their trend is from northwest to southeast. They form the mountain barrier between Persia and Turkey and are known as the Zagros Mountains in the north and the Pushti Kuh in the south. Some of the peaks are snow-crowned most of the year, and Mount Alijuk, south of Ispahan, is 14,000 feet in elevation. But the highest continuous range of these highlands is the Kuh Dinar, extending north of Shiraz, whose highest summit, the Kuh i Dena, is over 14,000 feet in elevation. Islands along the east coast of the Persian Gulf are merely the partly submerged fragments of the coast ranges.

The table-land of the interior, thus walled in by mountains, is itself intersected by numerous ranges and detached masses of mountains, excepting in eastern Persia, where great plains and deserts are the main topographic feature. Between these ranges, also extending northwest and southeast, are wide plains and narrow valleys. These plains and valleys would be utterly sterile were it not for the mountains near them, which fortunately receive most of the precipitation in the winter in the form of snow which is easily stored against the summer. The valleys are more easily irrigated and are thus more fertile than the plains, which are here and there brightened by a patch of green oasis, but for the most part are sandy and barren. The general aspect of the plateau is that of a cheerless and monotonous waste stretching to the base of mountains that are equally bleak and uninviting and reaching the acme of desolation in the two deserts of the east, the Dasht i Kavir or Great Salt Desert, extending between lat. 33° and 36° N. and from long. 52° to 57° E., and the more southerly Dasht i Lut or Great Sand Desert, extending between lat. 29° and 32° N. and between long. 57° and 60° E. Their combined length is over 500 miles from northwest to southeast, but they are separated between the thirty-second and thirty-fourth parallels by a hilly region through which passes one of the main caravan routes between central Persia and Meshhed in the northern mountains. The origin of the Great Salt Desert is not yet clearly determined. One theory is that it is due to the drainage of intermittent saline streams from the surrounding higher lands and the consequent deposition of a white crust or efflorescence; the other theory is that it is the bed of an ancient salt lake. Geologists now incline to the latter explanation. In 1891 a solid bed of rock salt estimated at over 600 square miles in area and several feet in thickness was discovered in this remarkable region. Lieutenant Vaughn and C. E. Biddulph, who brought to light this sea of solid rock salt, which is probably unrivaled in the world, found it so hard that with

iron tent pegs they were able to detach only a few chips.

The Dasht i Lut or Great Sand Desert, which separates the Province of Khorassan from that of Kirman, has salt also as one of its chief ingredients, but it is rarely overlaid like the more northern desert with saline incrustations or briny swamps. It gives life to a few poor shrubs, while nothing grows in the other desert. Sand is its prevailing feature. It is much lower in altitude than the Great Salt Desert, its average elevation being less than 2000 feet, while in places it sinks to only 500 feet above sea level. All these topographic aspects have a marked effect upon the distribution of the population. The lines of villages and cities follow the trend of the mountains from east to west across north Persia and from northwest to southeast across west and central Persia, because only in the neighborhood of the mountains can water be obtained to supply the towns and nourish the gardens and fields. Where the ranges spread far apart and in east Persia, where there are few high elevations, there is only a sprinkling of human inhabitants. Desolation reigns over vast expanses.

Hydrography. The waters of four-fifths of Persia do not reach the ocean, but are lost in inland seas, swamps, or lakes or disappear in the sands. Few rivers are worthy of special mention. Among them is the Karun, which drains a large part of the mountainous provinces of Luristan and Khuzistan, empties into the Persian Gulf, and is nearly 4 feet deep throughout the year. A small steamer, subsidized by the British government, is now making regular trips 150 miles up the river to Ahwaz, where rapids and ledges obstruct navigation. No other river is navigable. The Sefid Rud, Atrek, and Gurgan, draining the northern slopes of the Elburz and its prolongations, are the only considerable streams entering the Caspian. The streams flowing to the inland basins are much inferior in volume to those emptying into the sea. The Helmand, the upper part in Afghanistan, forms just east of the Great Sand Desert the Lake of Seistan, surrounded by great swampy tracts covered with wiry grass or great reeds. Only two other lakes are of importance. Lake Urumiah lies in the extreme northwest, and from its surface the snowy top of Mount Ararat may be seen. It is heavily charged with salt. Its wooded shores and islets give a pleasing impression, but the average depth is only about 15 feet, and, though it covers an area of about 1600 square miles, its volume is six or seven times inferior to that of Lake Geneva in Switzerland. The great salt lake of south Persia is Niriz, much smaller than Urumiah and with a greatly indented and fantastic outline.

Climate. The winter cold is intense on the high table-land. The summers are very warm, but there is little humidity, and the dry, clear heat is easier to bear than that of north India. On the other hand, the air is damp and relaxing in the forest-covered lowlands of the Caspian, and the southern maritime tracts are very dry and hot at most seasons. Spring and autumn are the most enjoyable parts of the year. The average annual rainfall perhaps does not exceed 10 inches in any part of the country excepting along the Caspian, where the lowland Caspian provinces have a rainfall about five times greater than that of the highlands. The soils, composed of a mixture of sandstone,

limestone, and volcanic debris washed down from the mountain slopes, are very productive.

Flora. As Persia is a land of transition between eastern Asia and the Western World, its flora partakes of the character of the surrounding lands. The zones of vegetation succeed one another quite abruptly. Polar species, e.g., are found on the higher summits of the north, while wheat is cultivated at heights of 9000 feet, and rice and the fruits of southern Europe thrive on the neighboring lowlands. Except on the Caspian seaboard, the Persian flora is poor in varieties. Over most of the plateau the konar tree, cyprus, dwarf oak, walnut, and mulberry are almost the only timber encountered. But the rich humid valleys of the Caspian belt and the lower slopes of the Elburz produce timbers of great variety, including the oak, ash, beech, elm, alder, birch, sycamore, cherry, and thorn. In the same region the fruits of Europe and of Asia meet and are grown in great variety. Among the medicinal products are gum tragacanth, gum arabic, asafoetida, and several others; indigo, henna, madder root, saffron, gallnuts, and other dyestuffs are also valuable products. The rose is preëminent among flowers, and attar of roses is among the famous productions.

Fauna. The animals of Persia differ little from those of the neighboring lands. In the forests of the Caspian plain are the hare, fox, wolf, hyena, jackal, leopard, tiger, lynx, and wild boar. On the mountains are seen the ibex, mountain sheep, wild goat, antelope, and bear. The maneless lion sometimes attacks human beings, but preys chiefly on the wild boar. Although the Persian fauna is poor in number of species, the reptiles, especially lizards, are represented by many varieties. Owing to the general aridity of the land, snails and other land mollusks are nowhere found. The domestic animals include fine horses and mules, single-hump camels, sheep of the fat-tailed species yielding a fine quality of wool, dogs, and several species of falcons that are trained for the chase. In the Seistan region great flocks of ducks and geese may be found. Pelicans, swans, and snipe are also common.

Geology and Mineral Resources. Most of the table-land and mountains are of sedimentary formation, largely sandstone, Tertiary limestone, chalks, and Cretaceous nummulitic rocks. But interspersed among these sedimentary rocks are mountains built up of eruptive rocks and volcanic ash such as Mounts Demavend, Savalan, and many others. The deserts are composed mainly of saline and sand accumulations. The mineral resources are enormous, but are largely undeveloped. Roughly speaking, there are six mineral-producing zones: (1) the Province of Azerbaijan, in the northwest, where tin, iron, copper, lead, and coal are found; (2) the north and south slopes of the main Elburz Range, where iron and coal occur near each other, Teheran deriving its coal supply from this region; (3) Khorassan, the rich northeastern province, which contains the famous turquoise mines of Nishapur, which have been worked from an early age and in which are obtained considerable quantities of copper, coal, and salt; (4) the Province of Kirman, with copper, lead, borax, manganese ore, and fine marble; (5) the highly mineralized districts in the central mountains, with iron, antimony, nickel, cobalt, copper, lead, sulphur, and asbestos; and (6) the Persian

Gulf littoral, with naphtha, rock salt, iron, ochre, gypsum, nitrates, and sulphur. While Persia abounds in remarkable mineral resources, their commercial value is chiefly dependent on the cost of transportation to the coast or nearest markets. In the absence of good roads the minerals of large parts of Persia must long remain almost untouched. The total revenues to the government under the head of royalties and rents from mines are less than \$80,000 per year.

Agriculture. Tillage in Persia depends upon the water supply. The detritus swept down by the streams or torrents deposits a layer of soil upon the sand, which is subsequently fertilized by the same agency that brought it. A large amount of cultivable land is not yet utilized. Cereals, chiefly wheat, barley, and rice, are grown throughout the country. Also generally produced are peas, beans, lentils, grain, and millet. Sugar cane is sparsely cultivated, and coarse sugar is made, but large imports from Russia and France are necessary. Cotton, short in staple, thrives to an elevation of 5000 feet above the sea, and over 100,000 bales are annually exported to the mills of Bombay and Marseilles. Silk is produced in the Caspian provinces to the amount of 500,000 pounds a year, most of it going to Yezd, Kashan, and Ispahan, the centres of the manufacturing trade; and large quantities of cocoons are sent to Europe. Persian tobacco is known throughout western Asia for its superior quality. The home consumption is enormous, and the exports to other Asiatic countries and Egypt though large are smaller than formerly. The production is roughly estimated at over 50,000 tons a year. The poppy has been widely cultivated since 1864, chiefly in the central and southern provinces, with an average production of over 6000 chests of opium. The purest quality is sent to London for the extraction of morphine and is in part reexported to America. Indigo grown in the southwest is used in the dyeing of cotton. Nearly every house has its vegetable and tangled but beautiful flower garden. The fruits include the grape, plum, raspberry, apple, pear, peach, and apricot; and Persia is said to produce the finest melons in the world. Dates are grown along the Persian Gulf and are sold abroad. The implements of tillage are extremely primitive.

Live stock is not so great a source of wealth as formerly, and exports have declined. The sturdy Persian horse is excellent for cavalry or ordinary purposes, and the mule, though small, has extraordinary strength and endurance. The best camels of Khorassan carry 600 pounds at the rate of 20 miles a day. Skins and hides are exported to Bagdad and Russia. Persian lamb skins are famous. Sheep's wool is exported and is also used in the domestic manufacture of cloths and shawls. The shores of the Caspian and the rivers emptying into it are richly stocked with fish.

Manufactures. The chief manufactures are silk, woolen, and cotton tissues and artistic fabrications. Broadly speaking, there are no factories, the output being the work of private shops or the production of special, localized schools of industry. Almost every large town has its own special manufactures which cannot be procured elsewhere. The most important and best known of the textile fabrics is Persian carpet, of which there are about 30 different kinds, all hand-made and the design varying with each

carpet. Each kind has its own characteristics, so that it is easy to distinguish between the products of different districts. Carpets are sent to Europe and America. The woolen shawls of Kirman made of goats' hair are also famous. Cotton fabrics, chintzes, velvets, silks, and embroideries are produced in considerable quantity, though the cheaper fabrics of European looms have injured all the home textile industries including that of carpets. For illustration, see Colored Plate under Rugs.

The earthenware and falience of old Persia were its most famous artistic products. The ceramic arts, however, have now largely disappeared. Enameling in gold, silver, and copper is the best surviving relic of the ancient metal work. Native artisans still excel in copper, glass, and filigree work, and carvings. The lack of good means of transportation, the neglect of the government, the apathy of the people, and the invasion of foreign products are responsible for the undoubted decline of Persia in the manufacturing arts.

Commerce. The Russian frontier is within 80 miles of Tabriz, the commercial capital of Persia, and Russian steamers unload cargoes within 160 miles of Teheran. The result is that in northern Persia Russia is the predominant commercial factor. In southern Persia Great Britain, controlling the Persian Gulf, has been able, since the opening of the Suez Canal, firmly to establish its supremacy in trade. The great inland centres of commerce are Tabriz, Teheran, Ispahan, and Meshhed, connected by caravan routes to which smaller routes extending to most parts of the country are tributary. The imports are determined by the fact that the country is deficient in many products which constitute the necessities of civilized life. Iron is worked only in the rudest fashion, little sugar is made, domestic fabrics are in limited supply, and yet Persia consumes enormous quantities of sugar, hardware, textiles, and many other manufactures. Cotton textiles are the largest imports. Great Britain supplies most of the bleached and unbleached cottons. Reported imports and exports in the year 1910-11, 484,508,000 and 375,427,000 krans respectively (the kran is worth about 9 cents); in 1912-13, 567,576,000 and 436,333,000. Values of the leading imports and exports as reported for the latter year are shown below, in thousands of krans:

IMPORTS	1000 kr.	Exports	1000 kr.
Cotton goods	186,190	Cotton	93,843
Sugar....	138,978	Fruits	47,457
Tea....	40,978	Rice	42,309
Flour....	22,475	Opium	34,916
Yarn....	13,580	Spices	27,428
Woolen goods	15,815	Gums	13,902
Gold....	11,558	Skins	12,675
Petroleum	10,841	Cocoons	11,788
Haberdashery	10,100	Hides	11,359

Imports from and exports to Russia in 1912-13, 328,980 and 300,878 thousand krans respectively; United Kingdom, 86,382 and 34,328; British India, 66,799 and 22,270; Turkey, 23,389 and 37,927; Germany, 21,388 and 2928; France, 11,031 and 4829.

The principal ports are Bushire, Bender Abbas, and Linga, on the Persian Gulf, and Enzeli and Meshhed i Ser (the port of Balfarush) on the Caspian. Trebizond, a port of Asiatic Turkey

on the Black Sea, is still an important outlet for the trade of Tabriz. In February, 1903, the new tariff agreement between Russia and Persia, by which the ad valorem duties of 5 per cent on both exports and imports were changed to a specific tariff, went into effect. All the other foreign Powers are included in this agreement on the "most favored nation" basis.

Transportation and Communication. The roads are very poor, the caravan routes being merely mule paths. An excellent highway 217 miles long, extending from Resht on the Caspian Sea to Teheran, built by the Russian government, was completed in 1899. Another improved road built by British capital was completed in 1900 between Ispahan and Ahwaz, the head of navigation on the Karun River. Regular steamship lines connect the ports of the Caspian Sea with Russian ports, and the ports of the Persian Gulf with Great Britain and India. The only railroad extends from Teheran to one of the suburbs—6 miles. The telegraph system extends north and south across the country and east and west across northern Persia, with about 6500 miles of line. There are reported 218 post offices.

Banking. The Imperial Bank of Persia, established in 1889 under a concession granted to Baron Reuter, has an authorized capital of £4,000,000 sterling, which, however, has been considerably reduced owing to the fall in silver. The bank has the exclusive right to issue notes, which must not exceed £800,000 unless authorized by the Persian government. The issue of notes is on the basis of the silver kran, the coin in reserve now being 33 per cent. The head office is at Teheran, and there are branches at Tabriz, Resht, Meshhed, Ispahan, Yezd, Shiraz, Bushire, and Bombay. The Russian Banque d'Escompte, which is connected with the Russian State Bank, is also established in Teheran.

Government. The government till late in 1906 was an absolute monarchy in the hands of the Shah. In that year a national council (Mejliss) was introduced. (See *History*, below.) The Shah is assisted by a ministry consisting of a premier and of ministers of Foreign Affairs, Interior, Finance, War, Education, Posts and Telegraphs, Justice, and Commerce. The rule of the Shah is restrained in that it must accord with the "divine law" of the Mohammedan religion. Furthermore, the Imâm-Juma, not the Shah, stands at the head of the Shiah religious system, which prevails in Persia. The country is divided into provinces of varying size and importance, administered by governors-general directly responsible to the central government. The provinces are divided into subprovinces, districts, subdistricts, parishes, cities, towns, and villages. These minor divisions are administered by lieutenant governors, mayors, etc., who are appointed by the Governor and are directly responsible to him. Justice is administered both by the Shah and by the clergy, according to the laws of the Koran, and is often satisfied, even in connection with the worst crimes, by payment of money to the government. The Persians, however, have been notorious for the cruelty of their punishments and their disregard of human life. Teheran is the capital.

Finance. The revenues and business of the country suffer from the great fluctuation in value of the silver medium of exchange. Owing to

the rise in the price of silver, the value of the revenue rose in 1890-91 to £1,775,000, but the subsequent decline in the price of silver reduced the value of the revenue for 1904-05 (estimated at about £1,450,000); for 1913-14 the revenue amounted to £1,480,778. The revenue is derived from assessments upon towns, villages, and districts, and from the customs, post office, telegraphs, fisheries, mines, and some other concessions. Expenditure for 1911-12 was reported at £1,608,600. Public debt: Russian loan of 1900, 22,500,000 rubles; Russian loan of 1902, 10,000,000 rubles; British loan of 1911, £1,250,000 (these three loans at 5 per cent); floating debt, 104,870,000 krans; annuities, 14,000,000 krans.

Weights, Measures, and Money. The kran, a silver coin, is the monetary unit. Its value, subject to great fluctuations, is about 9 cents. The copper coinage has been entirely replaced by large quantities of nickel 5 and 10 centime pieces coined at Brussels and put into circulation in 1900. There are six gold coins—the toman (nominally 10 krans) and subdivisions and multiples thereof. Very little gold is in circulation. The unit of weight is the miskal (71 grains), but most articles are bought and sold by a weight called batman or man, which varies in avoirdupois, one of the most commonly used being the man-i-Tabriz, which equals 640 miskals or 6.49 pounds. The unit of measure in Persia is the zar or gez, of which several standards are in use, the most common measuring 40.95 inches.

Population. The inhabitants are estimated to number about 9,500,000, the largest part of whom live in the cities and towns. Large areas are uninhabited. The estimated population of the principal cities is: Teheran, 280,000; Tabriz, 200,000; Ispahan, 80,000; Meshhed, 60,000; Kirman, about 60,000; Yezd, 45,000; Balfrush and Shiraz, 50,000 each. The inhabitants are divided into two distinct classes, the dwellers in towns or villages and the dwellers in tents. Many of the richer dwellers in the towns leave for the mountains during the hot summer months. The nomads, which include Arabs (260,000), Kurds (675,000), Turks (720,000), Luris (234,000), and Baluchis and Gypsies (20,700), move from place to place according as their animals need pasturage or their other interests dictate.

Religion. Upwards of 90 per cent of the people belong to the Shiite sect of Islam. Some 800,000, principally Kurds in the northwest, are Sunnites. Wide tolerance is exercised towards the followers of other religions in places where Europeans reside, but elsewhere they are sometimes oppressed by the lower classes of the population. It is supposed that Christians in Persia number about 80,000, Jews, 36,000, and Parsis, 9000.

Education. All wealthy families employ private tutors for their children, and many colleges supported at public expense instruct students in religion, Persian and Arabic literature, and some scientific branches. There are also many schools for children, but most of the instruction is limited to the reading of the Koran. Western languages and science have been introduced to some extent into Persia by the polytechnic school which was opened in Teheran in 1849. It has several European professors. There are military colleges at Teheran and Tabriz, and a number of schools with improved methods of

teaching supported by subscription and small tuition fees are in several of the larger towns.

Army. Owing to an irregular and inefficient military system the recruitment by territorial district, province, and tribe is usually less than that anticipated. From time to time attempts have been made to utilize the services of trained European officers, especially Russian and Swedish, but these attempts have so far met with little success. The theory of military liability includes a contingent of one or more battalions from districts, provinces, and tribes. Christians and Jews pay a military tax, but do not serve in the army. The land forces, on paper, consist of (1) a regular army (*nizam*) of 79 battalions of infantry, 23 batteries of field artillery, a battalion of engineers, and a Cossack brigade, under Russian officers, stationed at the capital—in all, about 50,000 men; (2) an irregular force, poorly armed, mostly cavalry, about 50,000 men; (3) a military police, under 36 Swedish and 120 native officers, consisting of about 6000 men, of whom about 2000 are mounted. This police force is armed with Mauser rifles and machine guns and has a battery of mountain guns attached. It covers the roads connecting the principal cities and towns, with headquarters at Teheran, Kazrin, and Hamadan. See ARMIES.

Ethnology. The Persians, ancient and modern, are the most numerous and the most important historically of the Iranian group of Aryan peoples. The great plateau of Iran has been occupied since the earliest historical times by peoples of Aryan stock, Medes, proto-Medes, and ancient Persians, who played a great rôle in the development of western Asia, produced monuments of lasting grandeur, imposed a court and a language upon nations from the Mediterranean to the Bay of Bengal, and through their literature profoundly influenced both the Orient and the Occident. They are also said to have had more or less to do with the rise of strict monotheism among the Hebrews after the captivity. The culture of the modern Persians covers a wide range, from the civilization or semicivilization of the cities and towns to the nomadism and pastoralism of a very primitive sort prevalent in the mountainous districts. The civilization of the Persians is often spoken of as only "skin-deep," the barbarian and the savage sleeping but lightly in the garb of culture. Physically the mass of the Persians belong to the Aryan type, although much intermixture (as the modern Persian type shows) has taken place. The pure Iranian is to be found among the Farsis about Persepolis, and among the Loris (Luris) or mountaineers, somewhat farther to the west. Of the "ideal Persian type" there are three subvarieties: 1. A darker population towards the southwest, along the line of contact with the Arabs; a Semitic strain pointing towards Africa. 2. The great mass of the Persian population—the Hajemis and Tajiks of the east and northeast—the result of a Turkoman-Tatar cross with the pure Iranian. Here belong also the Azerbaijani Tatars, Turkish in speech, but distinctly Iranian in race. 3. The Susians about the mouth of the Persian Gulf in the southeast, where a strain of Negroid blood is apparent and relationship with the hill tribes of India is suggested. Some authorities, however, do not attribute so much importance to the Negroid traits of the Susians, since they may be due to slave intermixture. With the

Hajemis, whose habitat is chiefly between Teheran and Ispahan, belong the Talych, Mazanderani, and other tribes of the Caspian littoral, to whom are closely related, both dialectically and otherwise, the Tat and Guran of the extreme west, who are agriculturists. The Tajiks are the settled agricultural population of the greater part of Persia, as well as the stock from which many of its mercantile classes come. The same name is applied to their kindred between the Caspian, China, and India. The Tajiks are brachycephalic and above the average in height, while the Hajemis and in part the Farsis are dolichocephalic and of average stature. The Persians of the Persepolitan country are fair-skinned, slender, finely formed, and blonds by comparison with their darker neighbors. The Loris or Luris are taller, much darker, and dolichocephalic. Besides its Aryan population Persia contains a considerable number of Turks and some few Arabs. In the extreme west Kurds (Aryans) are also to be found; likewise some Armenians, also Aryans. See *PLATE OF ASIA, YELLOW RACES OF*.

History. Although the legendary history of Persia begins some thousands of years before the Christian era, our earliest trustworthy information is derived from the Greek writers. Herodotus, Ctesias, and Xenophon are our chief authorities, but their accounts are very conflicting. The northwestern part of Iran, anciently called Media (q.v.), was, when it was first known to the Greeks, a part of the Assyrian Empire; but the Medes revolted and under Deioces established an empire which subdued both Assyria and their own kindred Persia. Herodotus states that the Persians were brought under complete subjection, but Xenophon's account implies that they were entirely independent, or at most that they recognized only a nominal allegiance to the ruling power.

The history of the Persian Empire proper begins with the revolt under Cyrus the Great about the middle of the sixth century B.C. With the defeat of Astyages, King of the Medes, the Persians gained their independence and subdued their former masters, who from this time became amalgamated with them. Cyrus continued his career of conquest and soon succeeded in establishing a mighty empire, which extended from the Oxus and Indus to the shores of the Mediterranean. (See *CYRUS THE GREAT*.) His son, Cambyses II, a cruel tyrant (529-522 B.C.), subdued Tyre, Cyprus, and Egypt. After the brief rule of the usurper Smerdis (522-521), Darius I, surnamed Hystaspis (521-486), mounted the throne. He firmly established his dynasty, added Thrace and Macedonia to his empire, and suppressed a revolt of the Greek cities of Ionia; but his two attempts to subdue Greece were completely foiled—the first by the Thracians, and the second by the Athenians at Marathon (490). One important service which he performed for the Empire was the organization of the satrap system of administration. The whole Empire was divided into provinces, and over each was placed a governor, or satrap, who was directly responsible to the Great King. Some uniformity in the government was thus secured, and the Empire, as a whole, was very much strengthened. Darius' son, Xerxes I (486-466), raised the largest army that the world had ever seen for the subjugation of Greece. His military force was seconded by a great fleet. The King himself led the expedition in 480. He at

first advanced successfully, but his fleet was utterly defeated at Salamis, and in 479 his army was overwhelmed at Plataea, while his fleet sustained another great defeat at Mycale, on the coast of Asia Minor. He was now forced to act on the defensive and thereby, despite his energy, exhausted the resources of his kingdom. (See *GREECE, Ancient History*.) His son, Artaxerxes I (466-425), surnamed Longimanus, was unable to stay the decadence of Persia, which had now commenced. He, however, crushed a formidable rebellion in Egypt, though his wars with the Greeks and the Ionians were unsuccessful. The Empire became racked by internal strife, which continued during the reigns of his successors, Xerxes II Sogdianus, Darius II, Artaxerxes II, and Artaxerxes III. Darius III Codomannus (336-330), the last of the dynasty, was compelled to yield his throne to Alexander the Great (q.v.), who conquered all the former provinces of Persia and founded a vast empire, which after his death, in 323, was divided into four parts, Persia along with Syria passing to the Seleucidæ (q.v.), and its old dependency, Egypt, to the Ptolemies.

The Seleucidæ soon lost Bactria, which became independent under a series of Greek sovereigns; and about 246 B.C. Parthia (q.v.) also rebelled under Arsaces I, who founded the dynasty of the Arsacidæ (q.v.), by whom the greater part of Persia was wrested from the Greeks and defended alike against the Greeks and the Romans. The Greek Empire of Bactria, which included part of north Hindustan, was overthrown by nomads from Turkestan. The Parthians drove these invaders out and added Bactria to their Empire. The dynasty of the Arsacidæ was brought to an end about 226 A.D. by a Persian named Ardashir (q.v.), the founder of the dynasty of the Sassanidæ (q.v.).

The Sassanian kings raised Persia to a great height of power and prosperity and more than once imperiled the Byzantine Empire. The greatest of these monarchs were Shapur (Sapor, Shahpuhr) I (241-272), the patron of the heresiarch Mani (q.v.); Shapur II (310-379), the opponent of Constantius and Julian and a bitter foe of the Christians; Khosru (Chosroes) I Nushirvan (531-579); and Khosru II Parviz (590-628). Soon after the death of Khosru II the Persian monarchy was engulfed in the tide of Saracen conquest. The victories of Cadesia (c.636) and of Nehavend (c.642) made the Arabs masters of the Kingdom. During the reigns of Omar (the first of the Arab rulers of Persia), Othman, Ali, and the Omniads (to 750), Persia was ruled by deputy governors; but on the accession of the Abbassides (750) Bagdad became their capital and Khorassan their favorite province, and Persia consequently was regarded as the centre of the caliphate. But their rule soon became a nominal one, and ambitious governors established independent principalities in various parts of the country. Many of these dynasties were short-lived, but others lasted for a considerable period and represented powerful empires. The chief in west Persia were the Tahirites (820-873) in Khorassan; the Saffarides (c.867-900) in Seistan, Fars, and Kerman; their successors, the Samani (q.v.) (900-1229), who became the rulers of Transoxiana, Khorassan, and Seistan; the Ziyarides (928-1042)—Kabus, the hero of the *Kabus Namah*, was one of them—in Tabaristan and Isfahan; and the shahs of Dilem, Buy-

ides or Buwayhides (932-1035). In east Persia the Ghaznevides (q.v.) (962-1186) carried their conquests to India under the famous Mahmud (1005-30). This period (end of the tenth and beginning of the eleventh centuries) was illustrated by the great names of Firdausi, Biruni, and Avicenna (q.v.). See PERSIAN LITERATURE.

This series of dynasties was ended by the Seljuks (q.v.), whose dominion extended from the Hellespont to Afghanistan. The unity of their empire was, however, soon destroyed. The sultans of Khwarezm, e.g., gradually acquired the greater part of Persia, driving out the Ghaznevides and their successors the Ghurides (see GHURI; KHIVA); but, together with the petty dynasties which had established themselves in the southwestern provinces, they were swept away by the Mongols under Genghis Khan (q.v.) and his grandson Hulagu Khan, the latter the founder of a new dynasty, the Perso-Mongol or Ilkhan (1251-1335). It was followed by several petty dynasties of Ilkhans, i.e., provincial khans as distinguished from the sovereign Khan, or Khakan, of China. Persia was freed from their misrule by Timur (q.v.), one of the world's greatest conquerors. Shortly after the death of Timur's son and successor, Shah Rukh (died 1447), the Turkomans, led by Uzun Hasan, took possession of the western part of the country, while the eastern portion was divided among Timur's descendants, until at the close of the fifteenth century the Uzbeks (q.v.) added all eastern Persia to their new Khannate of Khiva.

In 1500 a new dynasty arose in western Persia. Ismail, the first Prince of this line, became the leader of a number of Turkish tribes, overthrew the Turkomans and seized Azerbaijan, which was the seat of their power. He quickly subdued the western provinces and in 1511 took Khorassan and Balkh from the Uzbeks, but in 1514 he had to encounter a much more formidable enemy in Selim I (q.v.), the Sultan of Turkey. The Persians were totally defeated in a battle on the frontiers, but after his retreat Ismail attacked and subdued Georgia. His son Tamasp (1523-76), a prudent and spirited ruler, repeatedly drove out the Uzbeks from Khorassan, defeated the Turks, and assisted Humayun, the son of Baber, to regain the throne of Delhi. After a period of upheaval, during which the Turks and Uzbeks attacked the Empire, Shah Abbas I the Great (1585-1628) ascended the throne, restored tranquillity, and repelled the invaders. In 1605 he inflicted on the Turks a defeat which enabled him to recover the whole of Kurdistan, Mosul, and Diarbekir, which had for a long time been separated from Persia; while in the east Kandahar was taken from the Great Mogul. The government of Abbas was strict but just. He constructed at immense expense roads, bridges, caravansaries, and other conveniences for trade, and, with a tolerance unusual in a Mohammedan, he encouraged the Armenian Christians to settle in the country, knowing that their industry would help to advance the prosperity of his kingdom. His successors, Shah Sufi (1628-41), Shah Abbas II (1641-66), and Shah Sulaiman (1666-94), were undistinguished by any remarkable talents, although the two former were sensible and judicious rulers and advanced the prosperity of their subjects. During the reign of Sultan Hussein (1694-1722) priests and slaves were elevated to the most important offices of the

Empire and religious persecution ran riot. The consequence was a general discontent, of which the Afghans took advantage by declaring their independence and seizing Kandahar (1709). Their leader, Mir Vais, died in 1715, but one of his successors, Mahmud, invaded Persia (1722), defeated Hussein's armies, and besieged the Sultan in Ispahan. Hussein then abdicated the throne in favor of Mahmud, who on his accession immediately devoted his energies to gaining the confidence of his new subjects. He became insane and was deposed in 1725 by his brother Ashraf (1725-29), but the latter's tyranny was ended by Nadir Shah (q.v.), who raised first Tamasp (1729-32), and then his son, Abbas II (1732-36), of the Sefavid race, to the throne. Not content with the nominal rule, Nadir Shah found a pretext to depose Abbas and seized the sceptre (1736-47). On his death anarchy reigned; the country was devastated by the rival claimants for the throne; Afghanistan and Baluchistan finally separated from Persia, and the country was divided into a number of small independent states till 1755, when a Kurd named Kerimkhan (1755-79) reestablished unity in western Persia and by his wisdom, justice, and valor gained the esteem of his subjects and the respect of neighboring states. After a period of anarchy Lutf Ali ascended the throne in 1780, but was attacked by Agha Mohammed, a eunuch of the Kadgar race, who had set up an independent principality in Mazanderan. Agha Mohammed triumphed in 1795, becoming the founder of the present dynasty. On his accession he announced his intention of regaining what had been lost since the reign of Kerimkhan and accordingly invaded Khorassan and Georgia, subduing the former country almost without effort. The Georgians, however, besought the aid of Russia, but Agha Mohammed at once marched his army into the country and devastated it with fire and sword; his conquest was, however, hardly completed when he was assassinated, May 14, 1797. His nephew, Futteh Ali (1797-1834), succeeded him and after a period of conflict succeeded in fully establishing his authority. He completely subdued the rebellious tribes in Khorassan, but was involved in a war with Russia soon after his accession and by a treaty concluded in 1797 was forced to surrender Derbend and several districts on the Kur.

In 1801 Georgia was declared to be a Russian province. War with Russia was recommenced by Persia at the instigation of France, and after two years of disaster Futteh Ali by the Treaty of Gulistan (Oct. 12, 1813) ceded to Russia Daghestan, Shirvan, Baku, etc., and granted her the right of navigation in the Caspian Sea. In 1826 a third Russian war broke out, equally unfortunate for Persia, which in the Treaty of Turkmanchai (1828) had to surrender the bulk of Persian Armenia and pay a war indemnity of 18,000,000 rubles. The severe taxation necessary to pay this sum so exasperated the people that they rose in insurrection (Oct. 12, 1829) and murdered the Russian Ambassador, his wife, and almost all the Russian Legation. The most humiliating concessions and the mutilation of 1500 of the rioters alone averted war. The death of the Crown Prince, Abbas Mirza, in 1833, seemed to give the final blow to the declining fortunes of Persia, for he was the only man who seriously attempted to raise his country from its abasement. By the

assistance of Russia and Great Britain Mohammed Shah (1834-48), the son of Abbas Mirza, obtained the crown. He resolved to extend the Persian dominions to the Afghan, Baluch, and Khivan boundaries, but an attempt which he made to reannex Herat was resisted by England. The war was terminated in 1838 by the landing of a small Sepoy force on the shores of the Persian Gulf.

Nasr ed Din succeeded to the throne on his father's death in 1848, and the new government announced energetic reforms, but failed completely in carrying them out. Following his father's example, the new Shah resolved to reassert his claims in Afghanistan and Baluchistan. The ruler of Herat having recognized the claims of Persia, the English government remonstrated with the Shah, and he was compelled to sign an agreement on Jan 25, 1853, by which he bound himself not to interfere further in the internal affairs of Herat. In October, 1856, however, on the pretext that Dost Mohammed, the Ameer of Kabul, was about to invade Herat, the Persians again took the city of Herat. In consequence of this violation of the terms of the treaty with Great Britain, war was declared against Persia, and a British army was landed on the coast of the Persian Gulf, which, under Generals Outram and Havelock, repeatedly defeated the Persians and compelled them to restore Herat (July, 1857). In 1868 the Persians occupied Seistan, a province claimed by the Afghans, and extended their jurisdiction over the western third of Baluchistan. To put an end to this incessant strife, the Persians at length agreed with the Ameer of Afghanistan and the Khan of Khelat to refer the questions in dispute to an English commissioner. Sir Frederick Goldsmid accordingly visited the eastern frontier of Persia and in 1872 delivered his award. It carried the Baluch frontier from long. 58° to 63° E., so as to include in Persia the inland town of Jalk, and Guadar on the Indian Ocean. In 1870 the Russians granted the extension of the jurisdiction of Persia over the whole basin of the Atrek. In 1873 Nasr ed Din visited several of the European courts, in 1878 he visited Russia, and in 1889 he again made a tour of Europe. As a ruler he was energetic and severe. His policy was largely under the influence of the Russian court, though for a time, after the failure of his attempt to restore the Persian dominion over Herat, he maintained a somewhat friendly attitude towards Great Britain. He sternly repressed revolts and conspiracies, but, through the sale of the tobacco monopoly to English speculators, he offended many of his subjects, and his unpopularity was increased by the scarcity of food in several of the provinces in subsequent years. In 1896 a mullah, an adherent of a seditious sect, who had been banished from Persia in 1891, shot and killed the Shah while the latter was entering a shrine near Teheran. His son, Muzaffar ed Din, was proclaimed Shah in the following month. He died in 1907 and was succeeded by his eldest son, Mohammed Ali Mirza.

The two outstanding events in the history of Persia during the twentieth century were the establishment of parliamentary government and the economic partition of the country by Great Britain and Russia. In 1906 there was so much dissatisfaction with the corruption and incompetence of the government that over 15,000

people, mainly merchants, left Teheran, declaring that they would not return unless the Shah granted a constitution. The Shah yielded and issued a call for a national *Mejlis*, or Parliament, to be chosen by the princes, clergy, Kadgars (the royal tribe), nobles, and merchants. This body assembled in Teheran on Oct. 7, 1906, under the presidency of Sanieh ed Dowleh. Shortly afterward the Shah abdicated, and the Crown Prince, Mohammed Ali, governed as Regent; on the death of his father he was crowned Shah.

The new constitution of Persia gave to Parliament the control of the finances of the Kingdom. This was a most important provision, especially so for Persia, because the foreign nations could no longer control the country by giving money to the Shah, who was inclined to be a spendthrift. For this reason the latter was bitterly opposed to Parliament. Quarrels soon arose between the Shah and Parliament concerning the latter's powers. A powerful party appeared, composed of the mullahs or priests who favored absolute government by the Shah on the ground that a parliamentary régime violated the ancient customs and religion of the Persian people. Riots took place between the Absolutists and the Constitutionalists or Nationalists, which brought the country to a state of anarchy and civil war. In 1909 the Shah executed a coup d'état. The cabinet was forced to resign, and the Prime Minister was exiled. Martial law was proclaimed, and Parliament was dissolved by a body of Cossacks sent by Russia to aid the Shah, as the Persian army remained loyal to Parliament. This was followed by a civil war in which the Nationalists were generally successful. Ispahan, Tabriz, and the entire northern part of the Kingdom fell into their hands. The capital, Teheran, was finally captured, and the Shah fled for safety to the Russian Legation. Parliament was then recalled, and the Shah was deposed. On July 17, 1909, his son, Ahmed Mirza, a child of 11, was proclaimed Shah with Azod ul Mulk, a prominent Nationalist, as Regent. The ex-Shah was given a pension and exiled.

On Aug. 31, 1907, a convention was signed by Great Britain and Russia in reference to Persia. A line, starting with Kasr i Shirm, passing through Ispahan and Yezd and ending at the Russian-Afghan frontier, was drawn; above this line was to be Russia's "sphere of influence," below it England's. In order to discredit the new government these two Powers fomented internal disorder, they encouraged the semiwild tribesmen to make raids and supported the rebellious partisans of the deposed Shah.

A new Parliament was elected, which met on Nov. 15, 1909, and, finding the finances of the Kingdom in a very bad way, began to negotiate for loans in Great Britain and Russia. In the following year Great Britain protested that the Southern trade routes were being disturbed by brigands and that unless order was restored within three months a local police would be organized under British officers at the expense of the Persian revenue customs. The reply of Parliament was that the disorders were due to the presence of Russian troops and to the encouragement given by foreigners to the ex-Shah, who was constantly invading the country.

A most important event in the history of Persia was the appointment as Treasurer Gen-

eral of the Kingdom of W. Morgan Shuster, who was recommended by President Taft of the United States. To Mr. Shuster were given very large powers. He had full financial control, could supervise all expenses, and make important administrative changes; but his efforts met the constant opposition of Great Britain and Russia. One of the greatest problems was the collection of taxes, which were levied unscientifically and collected fitfully. The new Treasurer General organized a special force, the "treasury gendarmes," to enforce the payment of taxes. This aroused the bitter hostility of the wealthy Persians who had long escaped such burdens and of the officials and politicians who saw in such an administration the end of bribery and corruption. Foreign interference now became more active than ever, and a demand was made to dismiss the treasury gendarmes on the charge that they had insulted Russian officials. Parliament stood by Mr. Shuster, who declared that a restoration of the finances meant the restoration of order and denounced the efforts of the Powers to checkmate his efforts for reform.

On Nov. 29, 1911, an ultimatum was sent to the Persian government by Russia demanding the dismissal of Mr. Shuster and the employment of a new Treasurer General to be selected by Russia and England. Parliament refused the Russian demand, and a body of Russian troops were dispatched to enforce the ultimatum. Persia was in a critical situation. She was not in a condition to resist and was finally compelled to yield. Mr. Shuster was dismissed, and a Belgian, M. Mornard, was appointed his successor.

In 1912 Great Britain and Russia each agreed to loan Persia £100,000 in return for the recognition by the Persian government of the Russian-English Convention of 1907. This was done, and Persia can no longer be considered as an independent sovereign nation, for she is really partitioned between these two Powers. Great Britain had now entered into an alliance with Russia, her ancient diplomatic enemy in the East, in order to bring about a great *entente* between France, Russia, and herself in regard to Germany. The partition of Persia may be rightly regarded as one of the important steps leading to the Great European War of 1914. See WAR IN EUROPE.

The dismissal of Mr. Shuster was followed by disorders and uprising. The barbarous tribesmen began making raids, and insurrections were started by Salar ed Dowleh, the ex-Shah's half brother, who was a pretender to the throne. The latter was gotten rid of by an agreement to pay him \$9000 a year on condition that he live in Switzerland. On July 21, 1914, young Ahmed Mirza, now 16 years old, was proclaimed Shah, and the regency was abolished.

The Belgian, M. Mornard, was compelled to resign his position as Treasurer General, owing to the pressure of Russia. It seems to be the determination of the Czar's government to annex northern Persia outright, as large numbers of Russian peasants are pouring into this region and a Russian army is maintained there to protect Russian interests.

PERSIAN (pēr'shan or pēr'zhan) **ART**. The history of Persian art, including in its broadest sense architecture, sculpture, and other branches, falls into two main divisions—that dating from ancient times down to the Mohammedan conquest in the seventh century A.D. and that following this event. Several periods of development may be distinguished: 1. Prehistoric and Early Iranian, or before the eighth century B.C.; 2. Median (700-550 B.C.); 3. Old Persian, or Achæmenian (550-330 B.C.), followed by an interregnum after Alexander's invasion; 4. Parthian, or Arsacid (250 B.C.-226 A.D.); 5. Sassanian (226-650 A.D.); 6. Mohammedan, after the Moslem conquest of Persia (650 A.D. to the present).

Prehistoric and Early Iranian. Little if anything is known regarding art conditions during the archaic period of Iran's development before the rise of the Medes and Persians. Such little evidence as can be adduced is based largely on inferences drawn from scanty and crude vestiges that are supposed to date back to a high antiquity; or it is deduced from incidental allusions in the Avesta, or Zoroastrian Scriptures, if the passages containing them actually reflect conditions so old.

Median Period. The earliest achievements of the Medes, in architectural art especially, may be judged from references in literature, like the description of the magnificent battlements that surrounded the hill at Ecbatana (modern Hamadan) and were crowned by the palace of Deioeces, the first Median monarch, as recorded by Herodotus (1, 98-99). According to the account of Polybius (10, 27), who wrote in the second century B.C., the palace itself and the temple of the goddess Aena or Anais, corresponding to Anaitis (q.v.), were edifices built of wood overlaid with platings of gold and silver (offset by costly tiles), the precious metal of which still furnished priceless treasure for the ravaging armies of Alexander and his successors to carry away. The style of the structures must have formed a brilliant and light contrast to the heavy brick architecture of the Babylonians, even though influenced by the same. Median architecture must likewise have shown traits borrowed from Assyria and also from Asia Minor. Support is given to this view by certain stylistic elements in the very few remains of Median rock-cut tombs which antedate those of the great Persian kings. Beyond these there are only sporadic traces of

Median art surviving, such as some specimens of pottery, modeling, and carving, which are supposed to belong to that era.

Great Persian Period. The ruins at Pasargadæ, Persepolis, and Bahistan, or Behistun, furnish ever enduring monuments of art under the Achæmenian kings. The conquests of Cyrus and his successors seem to have led to certain modifications of style, even though the Persian touch made the artistic product one of its own. Architectural features, sculptural and decorative methods or designs, were adopted from Lydia and even from Egypt; stone replaced the earlier wood adorned by metal. Sculpture and glazed tiles, copied again from Assyro-Babylonian types both in style and subject, found wider vogue, especially in the beautiful enameled brick remains discovered at Susa, while additional traits of archaic Ionian Greek art found their way farther into Persia, as is presumed. Amid all these transformations, however, the Persians adhered to their open-air architecture, to their large light palace halls, as shown by the remains at Pasargadæ and particularly at Persepolis (q.v.).

A most original compound, the keynote to the Achæmenian architectural style, is what is termed the Persepolitan column, found also in great perfection at Susa. It is extremely slender, has numerous channelings, and stands on an elaborate bell-shaped base. Its capital is the most complicated of all ancient types, being usually in three superposed parts—the lower bell-shaped, the middle a fair-faced group of vertical volutes, the upper two bulls back to back. These columns appear to have supported wooden beams and were much more widely spaced than either the Greek or Egyptian columns. The most important remains are those of the terrace, gateways, and pillared throne halls of Darius and Xerxes at Persepolis and of Artaxerxes at Susa. Enameled and molded bricks of cement, forming relief pictures in brilliant colors, were a feature of the palace at Susa. The remnants of a ruined temple at Kangavar, near Kermanshah, consecrated probably to the Persian river goddess Anaitis (q.v.), show signs of Greek influence in its columns and masonry and may date towards the end of the Achæmenian era, even if some authorities are inclined to assign its construction to a still later period, falling under the Parthian sway which followed Alexander's invasion. The size and magnificence of the monuments increased with the expansion of the Empire, but, after culminating under Darius (see PERSEPOLIS), had been waning for over a century when Alexander conquered Persia.

Parthians and Sassanians. In vain the Hellenistic art of the period succeeding Alexander sought under the Seleucids to impose its yoke on these provinces. There is almost a blank until national existence was revived under the Parthian dynasty of the Arsacids. Even then art did not rise above mediocrity, for the dominant race was not artistic. The palace of Hatra, attributed to them, shows the heavy walls, small chambers and vaults of Assyro-Babylonian art, but the material is stone, and the ornamentation shows Greek influence. Some scholars, moreover (like Herzfeld, "Hatra," in *Zeitschrift der deutschen morgenländischen Gesellschaft*, vol. lxviii), urge the presence of Arab influence upon the structure.

Under the Sassanian Empire a real artistic

renaissance, almost thoroughly Oriental, took place, which lasted until the Arab conquest in the seventh century A.D. Earliest of all come the domed palaces of Pars and Sarvistan; then that of Firuzabad, and finally those of Ctesiphon and Mashita, with characteristic Iranian elliptic domes and partial return to Babylonian brickwork in place of Hellenic stone. Finally, as a transition to Byzantine art, already heralded at Mashita, with its wealth of decoration, come the palaces of Rabbath-Ammon and Eivan. This Sassanian art had many forms that are now destroyed. Its hangings and its rugs, with designs inherited from the earliest times, were doubtless models for mediæval workmen. Of its goldsmith work the silver cup of Khosru in Paris is a magnificent example, with clear lines and crisp details, influenced by the barbaric Greek school of the Black Sea and the Bosphorus. Coins and medals, seals, ivories, and cut gems, all show this mixture of influences. Allusions to the art of the sculptor, which was quenched by Moslem iconoclasm, will be found below.

Mohammedan Persia. All the earlier Mohammedan monuments of Persia, of the period of her domination of the Caliphate of Bagdad, were destroyed by the Mongols under Genghis Khan (c.1200). But Persian art revived in the fourteenth century and developed a new architecture which reached the highest splendor under the Sufi Shahs (1499-1694); an architecture of brick vaults and walls, brilliant tile facings, bulbous domes, huge portal niches, and round minarets. It was the parent of the Mogul style in India and of the Seljuk style in Iconium and in Turkestan. The Persian was the only Mohammedan school consistently to allow the use of the human figure in design—in wall paintings and illuminations, in metal sculpture and textiles. This school radiated into India and influenced all other Islamic schools, such as the Syrian, Spanish, and even, though slightly, the Egyptian. Even in modern times Persian art has retained its character and influence, its beauty of color and design, while other Eastern schools have to a greater or less extent died out, and it has not been without effect in raising the standard of taste in Europe and America, especially by its rugs and hangings.

Sculptural Art before the Mohammedan Conquest. Among the early arts of Persia, outside of the grand achievements in architecture, may be noted certain beginnings made in the line of sculpture, although the development of this artistic branch was lopped off by the Mohammedan conquest in the seventh century A.D. In archaic Iran there seem to be indirect traces of images or idols going back possibly to very remote times, as indicated by references in the Avesta and later Zoroastrian texts (e.g., *Av. Yasht*, 5, 126-129; *Vend.*, 19, 20-25; cf. *Strabo*, 15, 114), although the sin of idol worship was an abomination accursed by true followers of the faith of Zoroaster, as shown by references in Pahlavi literature (collected by Jackson, in the *Memorial Volume of Sir Jamsetjee Medressa*, Bombay, 1915). The stone lion at Hamadan (ancient Ecbatana) is notable as carved in the round in ancient times, possibly Median, whilst the bas-relief sculptures at Pasargadæ, Bahistan, and Persepolis have been alluded to above. An old Parthian sculpture of King Gotarzes (46-51 A.D.), chiseled in low relief near the base of the famous Bahistan

Rock, was almost obliterated in the eighteenth century of our era by a modern inscription incised at that time, but leaves traces of what the sculptor's art may then have been. Important remains of rock bas-reliefs made by Sassanian kings at Naksh i Rostam and Naksh i Rajab, near Persepolis (q.v.), have been alluded to above, as well as at Tak i Bustan, near Kirmanshah, and likewise on the Plain of Dilman in northwestern Persia, in addition to those in the south at Shapur and elsewhere.

Miniatures and Illuminated Manuscripts. The artistic creativeness of Persia reached one of its highest achievements, six or seven centuries ago, in Mohammedan times, in the production of miniature painted illustrations and decorative illuminations found in manuscript copies of the works of classic Persian authors. In their special line these miniatures are unrivaled in the history of art, whilst the scribes of the highly embellished texts themselves were unmatched in calligraphy, because the art of beautiful penmanship has always been regarded among the Persians as one of the most refined of all accomplishments. It is true that the earliest existing manuscripts of the old Avesta, though characterized by handsome handwriting, are relatively of too late a date to show what may have been the scribe's art in bygone days. Fragments, however, of Manichean manuscripts dating from between 600 and 900 A.D., or directly after the Sassanian era, have been found by Grünwedel, Le Coq, Stein, and others, at Turfan in eastern Turkestan, which are exquisitely written and adorned by a few small miniatures. These, combined with other testimony, furnished documentary evidence of Persian art in this line during the first Christian millennium, and comprise an admixture of the Oriental antique with Chinese style. Such fragments well entitle Mani, the founder of the religious sect of the Manichæans in the third century A.D., who was an artist as well, to his title "the Painter," besides his theological fame as an attempted reformer of Zoroastrianism in his day.

After the Mohammedan conquest there are evidences of the development of painting under the Fatimid caliphs, Abbasids, and the successive dynasties of the Safarids, Samanids, and Ghaznavids, down to the thirteenth century. The Timurid school, or line of artists developed after the time of the great conqueror, Tamerlane (Timur Lang), at Samarkand, Herat, Bokhara, and elsewhere, made notable advances in miniature painting and illumination during the fourteenth and fifteenth centuries, as is proved by specimens still existing.

The most famous of all the Persian miniature painters, and one whose brush illustrated pages in manuscripts now priceless, was Bahzad (Pers Bahzād or Bihzād), who lived at the Safarid court as royal artist (between 1460 and 1525). His name is signed so minutely and delicately in these exquisite paintings that it requires a microscope to decipher the signature. Among his greatest pupils and successors was Mirak (c.1475-1545 A.D.) of the Bokhara school, though he came from Ispahan and began his work at Herat in Bahzad's later years. Still later in the list of Persian miniaturists, who derived their skill from Bahzad, was the artist Sultan Mohammed at the court of Shah Tahmasp in the first half of the sixteenth century; he was not only deft with the brush, but remarkable also for his artistic productivity.

Among other artists in this realm was Riza Abbasi (Pers. Rida 'Abbasi), who flourished about 1640 and remains celebrated for all time by the consummate skill with which he outlined figures of personages by a few masterly sketched strokes.

The influence of Persian miniature painting came into striking prominence in India under the Mogul emperors in the seventeenth century and still survives there to-day. Turkey even earlier felt the Persian artistic touch which penetrated through Italy to Europe at that period. Viewed in the broadest light, it may be said that the specimens of Persian miniature paintings, which illustrate their best-known poets and are embellished by richly decorated frontispieces, sectional headbands, and artistic designs in the use of the original script, together with the use of the finest paper and sumptuous bindings in leather and particularly later, in India, in lacquer, furnish standards of the highest excellence in their own peculiar field. Other examples of the painter's art in Persia vary from portraits and designs, like those which adorned the palace of Shah Abbas at Ispahan, in the early seventeenth century, down to the most modern times. Important collections of Persian manuscripts with miniatures are to be found at London, Paris, Vienna, St. Petersburg, and Berlin, as well as in New York and Boston. See GLASS.

PERSIAN GULF. An arm of the Arabian Sea, between the southwest coast of Persia and the Arabian peninsula (Map: Asia, Central, D 9). It is entered from the Gulf of Oman, a northwestern arm of the Arabian Sea, through the Strait of Ormuz, 30 to 60 miles wide, and stretches from southeast to northwest, with a length of 520 miles and a breadth of 150 to 200 miles. Its area is about 90,000 square miles, including 1400 square miles of islands, which are generally barren and desolate. The most important islands are Ormuz, Kishm, and the Bahrein Islands (qq.v.), the last being noted for important pearl fisheries. The coasts, which are mostly of limestone formation, are high and steep on the Persian, but low and sandy on the Arabian side. The gulf is, as a whole, shallow, with an average depth of 200 feet, having shoals and banks in many places. The only

considerable river entering the gulf is the Shat el Arab—the combined waters of the Euphrates and the Tigris.

PERSIAN INSECT POWDER. See INSECT POWDER.

PERSIAN LAMB. The skin of young lambs of Caracal or black sheep, used for fur garments and trimming and characterized by a pronounced tight curl covering the skin uniformly. Traditionally the pelts are taken from still-born lambs, but in actual practice they are mostly from lambs killed before they are a week old, as the curl of the wool becomes less pronounced as the lambs get older. The pelts vary considerably in quality and are rigidly graded by the market according to the closeness and particular character of the curl and the lustre of the fur, skins selling in New York at all the way from \$1 to \$15 apiece. The coarser grades are sometimes classed as astrakhan. The skins are dyed to give them more uniform color and improve the lustre. They are almost entirely imported, being produced in Bokhara, but in 1915 attempts were being made to introduce the sheep and breed the lambs in the United States.

PERSIAN LANGUAGE. The modern Iranian language of Persia. The earliest authentic specimens are found in the fragments of Handhala of Badghis in the first half of the ninth century and of Abbas of Merv (809 A.D.). Closely connected with the Middle Persian or Pahlavi (q.v.) and with Old Persian (q.v.), modern Persian has undergone scarcely any change from the time of Abbas and Firdausi (q.v.) to the present day. In structure the language is analytic, like English. It is indeed possible to trace a certain analogy between the development of the two tongues. As English has become an analytic language as compared with Anglo-Saxon, so Persian is analytic, while Old Persian is highly inflected. Again, as English received through the Norman conquest the Romance and Latin elements, Persian was enriched with a large vocabulary of Arabic loan words by the Mohammedan invasions. On the other hand, it is considered inelegant in English to overload one's style with Latinisms, while in Persian stylistic charm is in direct proportion to the Arabisms employed. The phonological deviations of modern from ancient Persian are comparatively few. The principal ones are as follows: OPers. *ai* becomes NPers. *ē*, *i*, as OPers. *Haraiva*, NPers. *Harē*, *Hart*, Herat; OPers. *au* becomes NPers. *ō*, *ū*, as OPers. *raučah*, NPers. *rōz*, *rūz*, day; initial OPers. *y* becomes NPers. *j*, as OPers. *yauviyā*, NPers. *jōi*, *jō*, *jū*, canal; initial OPers. *v* becomes NPers. *b* before *a*, *ā*, *e*, *i*, *iy*, but *g* before *u*, as OPers. *vasiy*, NPers. *bas*, much, but OPers. *viyatarayāma*, we crossed, NPers. *guš aštan*, to pass over; OPers. *f*, *d*, *θ*, sometimes become NPers. *h*, as OPers. *kaufa*, NPers. *kōh*, *kāh*, hill, OPers. *dadātuv*, let him give, NPers. *dāham*, I give, OPers. *gābu*, NPers. *gāh*, place; but initial Iranian *s*, which sometimes appears as *θ* in Old Persian, is retained as *s* in New Persian, as OPers. *θuora*, Av. *suora*, NPers. *surā*, red; Old Persian surds between vowels and after *r* or *n* become sonants in New Persian, as OPers. *asapan*, NPers. *šab*, night, OPers. *pitar*, NPers. *pidar*, *pidar*, father, OPers. *Varkāna*, Hyrcania, NPers. *gurg*, wolf. The accent in modern Persian falls in general on the last syllable of the word. The preterit tense of the verb, except

in the third person singular, however, keeps the accent of the stem, as *āfaridam*, I created. In the New Persian noun there is neither gender nor, properly speaking, case. The plural, however, distinguishes to some extent between animate and inanimate, as *gāvdn*, cattle, but *jāmāh*, clothes. The plural ending *-ān*, which is now usurped in colloquial speech by *-hā*, is the old genitive plural, as Av. *āfāfnām*, of the nights, NPers. *šābān*, nights. The genitive and adjective relations are denoted by *i* (called by the Arabic term *izāfat*, annexation), placed between the governing word and the following genitive and between the noun and the following adjective, as *raftan-i laškar*, departure of the army, *āb-i pāk*, pure water. This *i* is derived from the similar use of *hya* in Old Persian and *yač* in Avesta, as OPers *kāra hya manā*, my army (lit., army that of me), *kāra hya Bābiruvīya*, Babylonian army (lit., army that Babylonian), Av. *āšahe yač vahūtāhe*, of best righteousness (lit., of righteousness that the best). The dative, especially in the older poetry, is frequently expressed by an appended *rā*, as *pidar-rā guftam*, I said to the father. This *rā* is the survival of the same use of *rādiy*, for the sake of, in Old Persian, as *avahya rādiy*, on account of this. Adjectives are compared by adding *-tar* for the comparative and *-tarin* for the superlative, as *buzurg*, high, *buzurgtar*, *buzurgtarin*. The verb in Persian is extremely simple. It has three persons, two numbers, an indicative, imperative, and (rarely) a precativ, an infinitive, a present (active) and past (passive) participle, and a gerundive. The tenses of the indicative are the preterit, corresponding in force to the Greek aorist; imperfect (formed by prefixing *mi* or *hami* to the preterit), corresponding to the Greek imperfect; aorist, corresponding to the Latin indefinite present; present (formed by prefixing *mi* or *hami* to the aorist); and future (formed by prefixing *bi* to the aorist). The passive is formed by the past participle with auxiliary *šudan*, to be, as *pursidāh šudan*, to be asked, while active periphrastic tenses are formed by the participles and the infinitive with the verbs *ast*, etc., he is, *būdar*, to be, *avāstan*, to wish.

The dialects of Persian are both numerous and, especially from a linguistic point of view, important. They are divided into three groups, the Pamir, Caspian, and Central. The Pamir dialects are Wakhi, Shighni, Sarikoli, Roshani, Tajiki, Sanglici, Minjani or Mungi, Yidghah, and Yaghnobi. The Caspian group includes Samnani, Mazandarani, Lahijani, Gilaki, Talishi, and Tat or Judæo-Persian. The Central dialects embrace Gabri, Shirazi, Bahbahani, Sivandi, Yazdi, Zafrahi, Kashahi, Vonishuni, Kuhludi, Nayini, Natanzi, and Kashani. But few of these dialects have as yet received any literary culture.

PERSIAN LILAC. See CHINA TREE; LILAC; MELIACEÆ; SYRINGA.

PERSIAN LITERATURE. The literature of Persia is, strictly speaking, divided into three great periods—old, middle, and new. In view, however, of the wide distinctions in chronology, language, and spirit, the Old Iranian literature, including the Avesta (q.v.) and the Old Persian inscriptions (see OLD PERSIAN), as well as the Middle Persian or Pahlavi (q.v.), may best be treated separately. The newer, or Modern Persian, literature, which began shortly after the Mohammedan conquest of Persia, is that which is usually implied by the term Persian literature. It is for the most part in verse, although prose is by no means lacking. The genius of the poetry of Persia lies in the ability to say old things in a new way. Perfection of form and euphony of phraseology are the marks of the Persian poet rather than lofty thought and sincere inspiration, while originality of theme is supplanted by fertility of conceits. The poetry is, consequently, so essentially different from that of the Occident that it is somewhat difficult for a Western reader to become interested in Persian verse unless he can habituate himself to the somewhat artificial poetic atmosphere to which he is transported. This artificiality, which to the Occidental mind is a defect, is to the Oriental a proof of genius. Nor is this view unreasonable. The freedom of the West has never existed in Persia. Crushed by a despotism, hampered by Mohammedanism, and circumscribed by social conditions, only a small range of subjects has been left open for the Persian poet. Striving to make the best of his material, he has been driven to elaboration rather than creation. The monotony which wearies the Westerner, whose meagre vocabulary cannot match the luxuriousness of synonyms and rhymes found in Persian, does not exist in the original. There the music of the verse and the dexterity of the turns of thought conceal the poverty of idea and give a pleasure which is real and justifiable.

The first Persian poetry of which any extensive remains have survived was epic, with the

general metrical scheme, read from right to left, $\text{—} \cup \text{—} \text{—} \cup \text{—} \text{—} \cup \text{—} \text{—} \cup \text{—} \text{—}$. Here belong the fragments of a translation by Rudagi (tenth century) of Bidpai (q.v.). To judge from these fragments, his style was simple and free from trivial conceits. The Persian literary historians term him the sultan of bards and regard him as the first classical poet. About this period flourished Kisa'i, Khabbaz, Abu'l Abbas, Khusrawani, and Umara. When the Samanid dynasty fell before the attack of Mahmud of Ghazni (died 1030 A.D.), the conqueror gathered at his court the poets and philosophers of the time. Of them the laureate was Unsuri, the author of an epic entitled *Wāmik u 'Adhrā*, of which a few verses are preserved in Asadi's rhyming dictionary, and the composer of a long series of eulogies on his patron. Greater than he, however, was his rival, Farrukhi, a master of description, although artificial and Arabized, who bent his energies, like Anvari, Khakani, and others, to eulogies of Mahmud. To this period also belongs Daqiqi, who began the task of composing an epic on the legends of ancient Iran. The work of Daqiqi, amounting, according to tradition, to about 1000 couplets, was incorporated after his death into the greatest of all Persian epics and one of the masterpieces of world literature, the *Shāhnāmāh*, or Book of Kings of Firdausi (q.v.). Of the epic poets who immediately followed Firdausi but two names have survived. The first of these is Ali ibn Ahmad al Asadi at Tusi, of the eleventh century (generally, but perhaps erroneously, supposed to be the same as the lexicographer Asadi), the author of the *Garšāspnāmāh*, wherein he recounts in between 9000 and 10,000 couplets the deeds of Garshasp (a mutilation of the Avesta name *Keresāspa*), the grandfather, according to some traditions, of the legendary Iranian hero Rustam. The second is the *Shahryār-nāmāh* of Muhtari (died 1149 or 1159), who wrote of the adventures of Shahryar, the great-uncle of Rustam. Of this poem, the scene of which is in great part laid in India, only a few fragments remain. The other epics of this legendary cycle are anonymous. Of these probably the most important is the *Sām-nāmāh*, which almost equals in length the *Shāhnāmāh* itself, and contains the adventures of Sam, according to the Avesta the grandfather of Keresaspa; and still longer is the *Barzān-nāmāh*, which, like the comparatively short *Jahāngirnāmāh*, the *Farāmurnāmāh*, and the *Bānū Gušāspnāmāh*, also forms a part of the Rustam cycle. The legendary epic yielded, however, to the historical. Here it was the story of Alexander the Great, augmented by myths, which gave the first impulse. The poets Nizami, Amir Khusru, and Jami, from the twelfth to the fifteenth century, each wrote an *Iskandar-nāmāh*. This series was followed by a long line of epics, in many instances hardly more than rhymed chronicles, of comparatively little poetic worth. It will be sufficient here to name as the most important Ahmad Tabrizi's *Shāhanšāhnāmāh* on Genghis Khan and his successors until 1338, Abdullah Hatifi's (died 1521) *Timūr-nāmāh* on Tamerlane, and the long *Jārjnāmāh*, or Book of George, by Mulla Firuz ibn Ka'us, celebrating the English conquest of India up to the fall of Poona in 1817. Side by side with the legendary and historical epic the romantic epos was developed. Firdausi himself had set the example in his *Yūsuf u Zalikhā*, based on the story of

Joseph and Potiphar's wife. The type of the romantic epic is conventional. The lovers become enamored of each other through a dream or a description, and the interest then centres about their constancy and their trials. The hero and heroine are either Iranian, as in the 21 epics on the loves of the Sassanian Khusru, his wife, the fair Armenian Shirin, and her lover, Ferhad, the sculptor, and the 10 versions of Behram Gor's 7 (or 8) love adventures; or they are borrowed from the Arabs, as the 14 poems on Joseph and Zalikhā, the 7 on Wamik and Adhra, and the 18 on Laila and Majnun. After Firdausi the first great poet in this genre whose work survives was Fakhr ed Din of Gurgan (born about 1048). His poem, the *Wis u Rāmin*, in about 9000 couplets, relates the love of Wis, the young wife of the aged King Mobad of Merv, for his brother Ramin. The point of the epic, which has many old Iranian elements, lies in the repeated deception of the doting monarch, and it is marked by a humor which is piquant even if unethical. A far greater romantic epic poet than Fakhr ed Din was Nizami (died c.1203), who wrote poems on three of the favorite themes already noted, the loves of Laila and Majnun, of Khusru and Shirin, and of Behram Gor. These works, together with his historical epic, the *Iskandarnāmāh*, and his mystical poem, the *Makhzan-ul-asrār* (Treasury of Mysteries), made a *khamseh*, or pentade, which was imitated by many poets. (See NIZAMI.) Nizami thus became the model for the romantic epos in Persia. Of his successors the most important was Jami (1414–92) (q.v.), whose *Yūsuf u Zalikhā* and *Laila u Majnun* are not inferior to the corresponding poems of Firdausi and Nizami. Khwaja Kirmani (1281–1352) returned to the legendary epic in his *Humāi u Humāyūn*, which describes the love of Humai, son of the mythical Iranian hero Hushang (the Haoshaungia of the Avesta), for Humayun, Princess of China, and a similar story is told in the same poet's *Gul u Naurūz*, on the wooing of Gul, the Princess of Rome (i.e., Byzantium), by Nauruz, Prince of Khorassan. On the other hand, Amir Khusru, of Delhi (1253–1325), wrote a romantic epic of his own time, entitled *Duvalrānī Khidrkhān*, on the tragic loves of the Persian Prince Khidrkhān and Duvalrānī, Princess of Gujarat. The multitude of minor poets in this genre may be passed over. A noteworthy modification of the romantic epic, however, deserves mention. This is the mystical romance. Katibi (died about 1434) in his *Majma' al-Bahrain* (Union of the Two Seas), also called *Nāzir u Manzār* (Seer and Seen), set forth in Sufistic diction (see SUFISM) the mutual love of God and man, while Jami treated the same theme in his poem on the loves of Salaman and Absal. Here too belong, together with many others, the *Gūi u Caugān* (Ball and Mallet), also called *Hābnāmāh* (Book of Ecstasy), of Arifi (1438), and the *Shāh u Gadā* (King and Dervish), of Hilali (died 1532).

From the epic and romantic epos one turns to the lyric poetry. Here the verse schemes are for the most part borrowed from the Arabs, although the *rubā'i*, or quatrain (see RUBAIYAT) is distinctly Persian in origin. The principal lyric forms are five in number and are as follows: (1) The *kassida* (Persian *qasidah*, from Arabic, signifying a 'fragment' of a poem) is employed chiefly in eulogies. It consists of at

least 12 and at most 99 couplets (*bait*), the second lines of which must rhyme with the first two lines (*matla'*), thus giving the rhyme scheme *aa, ba, ca, da*, etc. The thought in each *bait* must be complete in itself, but need not be inseparably connected either with the preceding or following couplet. To employ the Persian figure, the rhyme is the thread on which the pearls of the *bait*s are strung. The frequent change of order of distichs which is found in Persian manuscripts of lyric poetry thus becomes easily explicable. (2) The *ghazal* (from Arabic *ghazala*, to be abundant) is identical in form with the *kassida*, but can have no more than 12 couplets, the last of which must contain the name of the poet. This verse is devoted especially to poems on love and wine. (3) The *kit'a* (from Arabic *qata'a*, to cut off) is the same as the *kassida*, excepting that the *matla* is lacking. Its rhyme scheme is accordingly *ab, cb, db, eb*, etc. (4) The *mathnawi* (from Arabic *thanaya*, to fold) is a long poem of epic, mystic, or didactic content, with each *bait* or couplet rhyming, *aa, bb, cc, dd*, etc. (5) The *rubai*, or quatrain (from Arabic *rub'a'a*, 'four'), is preëminently the Persian form of epigram. Its metrical scheme, read from right to left, is:

and its rhyme is either *aana*, or *aaba*.

In general the Persian lyric differs from the epic only in those restrictions which the external form lays upon it. The spirit is practically the same. It is, of course, natural that the personal element should enter into the lyric far more than into the epic, and that we should find in its briefer compass a sublimation, as it were, of the conceits and mannerisms which are more scattered in the epic. The lyric poetry of Persia may be divided into the lyric proper, the religious and didactic, and the court poetry. In the first division love is the predominating *motif*, and the theme of next importance is wine. Into the purely subjective lyric, such as is familiar in modern Occidental poetry, the Persian does not enter. The love which is celebrated is either happy or, in the great majority of verses, blighted by the cruelty of, or separation from, the beloved. The poet rings countless changes on this single theme. He sighs for the curl and the mole, the sugar lip and the cypress form of the object of his devotion. In nearly every instance the love set forth is, at least superficially and exteriorly considered, sensuous. Of romantic devotion there is scarcely a trace in Persian literature, even in the greatest epics of the Joseph and Zalikha cycle. It is furthermore a characteristic of Persian erotic verse that the beloved is represented as a boy, as is shown, e.g., by the constant allusions to the skinker or *saqi*. This usage, strange and easy of misinterpretation to the Western reader, is borrowed from Arabic poetic usage. The explanation seems to lie, not in an assumption of low morality, but in the Arabo-Persian view that it is indelicate to refer openly to a woman. As the seclusion of women is universal throughout Mohammedan countries, the sole refuge left to the poet was to change in his verse the sex of his love. The incessant praise of wine was due to the fact that it is a forbidden drink.

Strict Mohammedan orthodoxy condemns the winebibber to hell on the authority of the Koran. The Persians, however, being Shiites in creed, are opposed on principle to the orthodox Sunnis, and as the old Iranians in pre-Islamic times were inclined to the use of wine, their descendants sing the praises of the grape in tones too real to be mistaken. Besides this exoteric reading of love and wine there is, however, an esoteric interpretation. The beloved is God, the curl is the transient charm which partially hides His face, the mole is the centre of His divine unity, and the wine is the ecstasy which fills man, the lover, at the thought of reunion with the Beloved, absent for a time and seemingly cruel. The literal interpretation too common in the West, which disregards or denies the mystic element in this poetry, may with some good reason be regarded as inadequate. It is self-evident, on the other hand, that a solely Sufistic view of these poems is equally misleading. The truth seems to be that there is no clear line of demarcation between the esoteric and the exoteric. Both were in many cases simultaneously present in the poet's mind.

In the Persian lyric by far the greatest names are those of Hafiz (q.v.) (fourteenth century), whose *ghazals* are his most famous poems, and of Omar Khayyam (q.v.) (died 1123), whose quatrains are the Persian poems best known to the Occident. Hafiz had been preceded by several poets, of whom Kamal ud din Isfahani (died 1237), Ibn Yamin (died 1344-45), and Salman of Sava (died 1376 or 1377) were the most noteworthy. After him came a long line of imitators of more or less ingenuity. Among them mention may be made of Jami, more famous as a didactic poet, and Amir Shahi (died 1453). Jami also had his lyric imitators, of whom the most noteworthy was Baba Fighani of Shiraz (died 1516 or 1519), who was called the minor Hafiz. With Jami, however, the lyric poetry of Persia reached its climax, even though minor poets wrote, and though Akbar sought to rekindle the dying flame by his royal patronage. Closely connected with the lyric proper is parody. Here belongs especially the name of Abu Ishak (died 1427), who devoted himself in his *Divan* to the glorification of gastronomy, sparing in his parodies neither Hafiz, Sadi, nor even Firdausi. A half century after Abu Ishak came Mahmud Kari, who sang the praises of clothes instead of food, and modeled a clothes state, which reminds one somewhat of Carlyle's *Sartor Resartus*, with burlesque substituted for philosophy. Besides the parody there is the lower vein of ribald verse, to which Orientals are somewhat inclined. Enough to mention the names of Sozeni (died 1173-74), Azraki (died 1132), and the greatest of them all, Ubaid Zakani (died 1370-71), beside whose verses even Martial loses piquancy. Here, too, is a Persian counterpart of Marguerite of Navarre, Mahisti, the favorite of the Sultan Sanjar (died 1157), who could write extremely spicy poems without forfeiting esteem. As is implied by the renown of Mahisti, Persian poetesses are not unknown. In the harem much fugitive verse was composed, chiefly, of course, of an erotic nature, but comparatively little has been preserved. As other subordinate forms of the lyric in Persia, the riddle and the *tarikh*, or chronogram, must be mentioned. The riddles do not differ essentially from those in other literatures. The chrono-

gram is, however, comparatively rare outside of Arabic and Persian. It is formed by the construction of an appropriate sentence, the sum of the numerical values of whose letters equals the year in which the event alluded to by the sentence occurred. It is stated by Kazwini, e.g., with regard to the entrance of Haasan ibn Sabbah, the notorious leader of the Assassins (q.v.), into the fortress of Alamut, which had anciently been called Alah Amut, that "by a strange chance the sum total of the letters *Al(a)h Amut* in the Arabic chronogram was the year of his entry into the castle." Adding the numerical values of the letters of this name, $a = 1, l = 30, h = 5, a = 1, m = 40, u = 6, t = 400$, we have the date of the event, 483 A.H. (= 1090 A.D.).

Closely connected with the lyric poetry of Persia, especially by the bond of mysticism, is the didactic and religious. So closely are the two related that it is sometimes impossible to decide to which class a poet belongs, because he in reality belongs to both.

The mystic and didactic poetry of Persia is entirely Sufistic in character. The greatest of all who wrote in this genre was Jalāl-ud-Dīn Rūmī (q.v.) (1207-1273), whose *Divān* and *Mathnawī* are among our most important sources for the study of Sufism. The first mystic poets, however, were probably Bayazid Bistami (died c. 874) and Abu Saïd ibn Abul Khair (968-1049), of whose works a number of quatrains have survived. In the eleventh century the *Rūšanā'nāmah* of Nasir i Khusru deserves mention. The earliest great predecessor of Jalal ud Din, however, was Farīd-ud-Dīn 'Attār (q.v.) (died 1299), whose *Mantiq ut-Tair* (Bird Parliament) is a remarkably beautiful allegory of the struggle of the soul to attain to the infinite. Here belongs also another of the greatest names of all Persian literature, Sadi (q.v.) (c. 1190-1291). His *Gulistan* (Rose Garden) and *Bāstān* (Garden) are among the greatest didactic productions of the East. The last important mystic poet was Mahmud Shabistari (died 1317), the author of the *Gulshān-i-Rāz* (Rose Garden of Mystery), which may serve as a textbook of Sufistic philosophy.

The court poetry, the third division of the lyric, is the least interesting of all from a literary point of view. The favor shown to poets from the earliest period of Islamic rule in Persia naturally encouraged the production of eulogies, which, with the luxuriance of Oriental imagination, are so fulsome as to cloy the Occidental reader. The metrical intricacy keeps pace with the increasing artificiality of the court poets. Such rhymes as *aaaaaaxxxxx, bbbbbbxxxx*, and so on, and a series of ghazals, united by *misra's*, or rhyming couplets at regular intervals, are common. Within the poems themselves there are conceits and obscure allusions which in many cases baffle even the ingenuity of an Oriental reader and give rise to commentary after commentary. From the long series of poets of this type the names of Watwat (1088-1182), Muizzi (died 1147), Khakani (died about 1199), and the greatest of them all, Anvari (q.v.) (died about 1190), may be mentioned.

The drama of Persia, apart from the miracle play of *Hasan and Husain* (q.v.), is of late development and little importance. The prose literature, as has been intimated, is also of small extent and value as compared with the poetry.

While it is true that Sadi in the works already mentioned intermingled prose and verse, and that his example was followed by Nakhshabi (died 1330) in his *Sindbādnāmah* (Book of Sindbad), it seems, nevertheless, strange that so few of the great Persian writers should have availed themselves of prose. There is, however, a mass of novels, tales, fables, legends, and anecdotes, as well as of history, encyclopedias, and the like. The oldest specimens of Persian prose are Muwaffak's book on pharmacology and Balamis' translation of Tabari, both dating from the tenth century. As authors of notes and travel we may mention Abu Tahir, whose numerous romances are concerned chiefly with old Iranian legends, as in his *Dāstān* or *Qahramānnāmah* (dealing with the legend of Hushang) and his *Darābnāmah* (on the story of Darius and Alexander), the anonymous writers of the *Sikandarnāmah* (on the Alexander legend), the *Qisṣah-i Hatīm Ta'i* (on Hatim Tai, proverbial for his generosity and nobility), and the modern Mohammed Takī (seventeenth century), the author of a huge romance in 15 volumes, entitled *Bāstān-i Xayāl*. There is besides a multitude of novelettes and of tales in the style of the *Arabian Nights* (q.v.). Here the most important are the *Baṭṭyār-nāmah* (Book of the Ten Viziers); the *Qisṣah-i ṣāḥār darvīsh* (Story of the Four Dervishes), perhaps by Amir Khusru (died 1325); the *Tutīnāmah* (Book of the Parrot), based on the Sanskrit *śukasaptatī*, and the *Bahār-i dāmī* (Spring Garden of Wisdom), by Inayat-ullah Kanbu (died 1671). The best known of all the prose fiction in Persian is Waiz Kashifi's (died 1504-05) *Anrār-i Suhaili* (Lights of Canopus), based on the *Kalīla wa Dimnah*, and so ultimately on the Sanskrit *Pancatantra* (q.v.), although the *Latā'if ut-tawā'if* (Witty and Amusing Stories) by Safi, the son of Waiz Kashifi, also deserves mention. As a proof that literary productivity, not only in prose but also in poetry, goes on in Persia in recent times, since the proclamation of the constitution in 1906, may be cited contributions from Persian newspapers, as shown in a volume by Prof. E. G. Browne, *The Press and Poetry of Modern Persia* (New York, 1914).

PERSIAN MUSIC. See ARABIAN MUSIC.

PERSIAN MYTHOLOGY. Only scanty traces of the mythology of ancient Persia have survived. The reform supposedly instituted by Zoroaster (q.v.) seems to have swept away the older nature worship which prevailed in Iran as in India. It is evident, however, that this reform was not absolutely thorough, and that under the orthodoxy which was forced on the people by Vishtaspa, the royal patron of Zoroaster, according to the rather doubtful Parai traditions, there lurked many old beliefs and myths which were heritages of the Indo-Iranian religion. When the first enthusiasm of this Zoroastrian Protestantism died out, the ancient faith revived in some measure, and in the Yashts, a part of the Avesta (q.v.) late in form but almost certainly old in content, many mythological allusions may be found. In some of the Pahlavi texts (see PAHLAVI LITERATURE), especially in the Bundahish, there survive numerous traces of the primitive faith, despite the Zoroastrian orthodoxy to which they theoretically conform. The six Amshaspands, who in Zoroastrianism represent the cardinal virtues of Good Mind, Best Righteousness, Desirable Kingdom, Holy Concord, Health, and Immortality, were originally deities protecting respectively cattle, fire, metals, earth, water, and plants, being therefore nature divinities, although some scholars are inclined to regard the spiritual side of these deified concepts as the more original. Ormazd, who in the Zoroastrian reform became the chief and really the only god, was originally a sky deity, whose son was the fire and who was also the father of the Good Mind, or, in the early evaluation of this godling, of cattle. His daughter was Holy Concord, the earth, who from many allusions in the Yashts was a goddess of fertility. The demons, who play a subordinate part in the orthodox texts, find a more prominent place in the Yashts. Important here is the serpent Azhi Dahaka, who was probably the sky serpent, corresponding to the Vedic Vritra slain by Indra (q.v.), especially as the Bundahish describes him as falling from heaven. The Yashts emphasize the nature worship of the pre-Zoroastrian religion in the chapters devoted to the sun, the moon, the planet Tishtrya, who, mounted on a black horse (perhaps the storm cloud), defeats the demon Apaosha (drought), and to the waters, Anahita, who is the Anaitis (q.v.) of the classical writers. To all these not only heroes, but even Ormazd himself, offer sacrifices, clearly pointing to an earlier period when one god was dependent on another for aid. Ghost worship also (see GHOSTS) is represented by the cult of the Fravashis, who seem to have originally represented the spirits of the beneficent dead. The cosmogonic mythology (see COSMOGONY) seems possibly to be largely derived from Semitic sources, for the antithesis of Ormazd, the god of the sky and light, to Ahriman (q.v.), the god of darkness, and their conflict at the creation of the world, is precisely analogous to the battle of the Babylonian solar deity Marduk with Tiamat, the demon of chaos. About trees and animals myths clustered. In the white Hōm tree, which will give man immortality at the day of resurrection,

there is possibly a pre-Zoroastrian reflex of the Semitic tree of life, while the human-headed bulls of Assyrian sculptures are represented by Gopatshah, a being half bull and half man, who pours holy water into the sea. The myth of the combat between Tishtrya, as bringer of rain, and Apaosha, the demon of drought, which is vividly portrayed in the Avesta (Yasht, 8), seems, like numerous others, to have been lost to later Persian tradition. In fact, with the downfall of the Iranian religion before Mohammedanism, the old myths vanished almost entirely, so that the mythology of modern Persia is practically Islamic. However, the *pairika*, a female demon of Iran, is preserved as the beneficent *peri* of modern Persian folklore, and the *simurgh*, a bird of magic properties, has become the *roo* of the *Arabian Nights*. Consult Georg Hüsing, *Iranische Mythologie* (Leipzig, 1905); id., *Die iranische Ueberlieferung und das arische System* (ib., 1909); Carnoy, *Iranian Mythology* (Boston, 1915).

PERSIAN POWDER. See INSECT POWDER

PERSIAN RITE. See LITURGY.

PERSIGNY, pār'sé'nyé', JEAN GILBERT VICTOR FIALIN, DUKE DE (1808-72). A French politician, born at Saint-Germain-Lespinasse in the Department of Loire. He joined the hussars in 1828, but after the revolution of July, 1830, owing to doubts as to his loyalty, he was expelled from the army on a charge of insubordination. He now became a journalist in Paris, formed the most intimate relations with Louis Napoleon, and commenced a career of Bonapartist propagandism throughout France and Germany in which he displayed extraordinary energy, pertinacity, and fertility of resource. Articles from his pen had already appeared in *Le Temps*, and in 1834 he founded *L'Occident Français* as a Bonapartist organ. He had the chief hand in the affair of Strassburg (See NAPOLEON III.) He also took part in the expedition to Boulogne, where he was captured and condemned to 20 years' imprisonment. His confinement, however, became almost nominal, and he passed his time in writing a voluminous and singular work on the *Utilité des pyramides d'Egypte* (1844). On the breaking out of the revolution in 1848 Persigny hurried to Paris and set himself, with his accustomed vigor and swiftness, to organize the Bonapartists. He was appointed aid-de-camp to the President, Louis Napoleon, and major general of the Parisian National Guard. In 1849 he was chosen a member of the Legislative Assembly. He was sent to Berlin as Ambassador at the close of the same year. As was to be expected, Persigny took a prominent part in the coup d'état of Dec. 2, 1851. In January, 1852, he succeeded Morny as Minister of the Interior. From 1855 to 1858 and again from 1859 to 1860 Persigny was the French Ambassador to Great Britain. He was recalled to France, however, in 1860, to resume the office of Minister of the Interior. This office he resigned in June, 1863, when the elections of Paris and other large towns showed dissatisfaction with his policy. In the autumn of the same year he was created Duke. He did not long survive the overthrow of the Second Empire, his death occurring at Nice, Jan. 13, 1872. Consult: Joseph Delaroâ, *Le duc de Persigny et les doctrines de l'empire* (Paris, 1865); Taxile Delard, *Histoire du Second Empire* (6 vols., ib., 1868-75); also references under NAPOLEON III.

PERSIMMON (from the Virginia Indian name), or **DATE PLUM**, *Diospyros* (family Ebenaceæ). A tree and its fruit, including several species growing wild and cultivated to some extent. The Japanese persimmon or kaki (*Diospyros kaki*) is the principal native fruit of Japan. It is found also in Korea, eastern and southern China, and parts of the East Indies. It is grown to a limited extent in southern Europe and was introduced into the United States about 1875. It finds a congenial climate in California and in the Gulf and South Atlantic States as far north as Virginia. The cultivated trees grow 8 to 12 feet high and bear a very attractive yellow, thin-skinned globose fruit often attaining the size of a medium orange. When ripe the fruits contain a soft sweetish pulp. A number of varieties are in cultivation, and these vary much in size, color, the number of seeds they contain, period of ripening, etc. The American persimmon (*Diospyros virginiana*) is native from Connecticut and Kansas south to central Florida and eastern

AMERICAN PERSIMMON (*Diospyros virginiana*).

Texas. Wild trees sometimes reach a height of 60 feet in the forest and are valuable as cabinet woods. In the open the trees seldom exceed 20 to 30 feet in height. Another American species, *Diospyros texana*, is grown in Texas. The fruits of the American persimmon are much smaller than those of the Japanese varieties, are very soft when ripe, and on this account are seldom marketed.

Persimmons are propagated from seed. Varieties seldom reproduce themselves, and so budding and grafting are resorted to. Seed sown in the fall is allowed to grow the following season. The second spring the seedlings are either budded or crown-grafted. Grafting gives the better results. Native trees may be successfully top-grafted with improved varieties. In transplanting to the orchard trees one to two years from the graft are preferred. Persimmons thrive on nearly all soils. Like other orchard fruits, they respond generously to cultivation. Trees come into bearing within four years after setting in the orchard. Top-worked trees produce fruit within three years from the graft. Some Japanese varieties are inclined to overbear and should therefore be thinned. Other varieties require male or staminate trees in the orchard to insure proper pollination. Such seedless varieties as *Tanenashi* and *Tamopan* appear to set fruit well without pollination. The green fruit of all varieties of persimmons is extremely astringent and maintains this condition until fully ripe. The ripening period of

the different varieties varies from August until December. Some native persimmons ripen before frost, which greatly improves others. The Japanese sorts should be gathered before frost and stored in a cool, well-ventilated, moist room until fully ripe. In Japan the fruit is packed in newly emptied sake or beer casks, the heads immediately replaced, and the packages made air-tight. In from 5 to 15 days, according to the prevailing temperature, the fruit may be removed in a firm, sound condition, with the astringency gone, and ready to ship long distances. F. E. Lloyd and H. C. Gore both found in 1911 that fruit for local distribution may be successfully processed with carbon dioxide. The fruit is usually consumed fresh as a dessert or out of hand. Some varieties may be dried or preserved. Consult: Hadley and Troop, "The American Persimmon," in *Indiana Agricultural Experimental Station, Bulletin No. 60* (Indianapolis, 1896); Lloyd, "The Artificial Ripening of Persimmons," in *Alabama State Department of Agriculture, Bulletin No. 42* (Montgomery, 1911); Gore and Fairchild, "Experiments on the Processing of Persimmons to Render them Non-Astringent," in *United States Bureau of Chemistry, Bulletin No. 141* (Washington, 1911); H. C. Gore, "Large Scale Experiments on the Processing of Japanese Persimmons, with Notes on the Preparation of Dried Persimmons," in *United States Bureau of Chemistry, Bulletin No. 155* (ib., 1912); Watts, "Persimmons," in *Tennessee Agricultural Experimental Station, Bulletin No. 11* (Nashville, 1899). In the latter bulletin both native and Japanese persimmons are considered. See Plate of PAPAW AND PERSIMMON.

PERSIMMON INSECTS. The persimmon does not suffer greatly from the attacks of insects. Several caterpillars may occasionally defoliate individual trees, especially the larvæ of *Spilosoma virginica*, *Orygia leucographa*, *Tolype vellela*, and *Ademasia concinna*. The little leaf miner (*Aspidusca diospyrella*) forms a minute blotch mine in the leaves of this tree and eventually cuts out a case in which it pupates. One of the plant lice (*Aphis diospyri*) seems to be specifically attached to this tree, but does little damage, and the same may be said of one of the flea lice (*Psylla diospyri*). One of the weevils of the family Otorhynchidae, viz., *Brachystylus acutus*, is found only on the persimmon, but does comparatively little damage.

PERSISTENCE IN TIME. See DURATION.

PERSISTENCE OF VISION. See VISION, *Duration of Visual Sensations*.

PERSIUS (AULUS PERSIUS FLACCUS) (34-62 A.D.). One of the most famous Roman satirists. He was born at Volaterræ (now Volterra) in Etruria, 34 A.D. He was of a distinguished equestrian family, was educated under the care of the Stoic philosopher Cornutus, and lived on terms of intimacy with the most distinguished personages of his time in Rome. The principal authority for the life of Persius is an abridgment of a "commentary" by one Probus Valerius. Modest and gentle in his manners, virtuous and pure in his whole conduct and relations, he stands out conspicuously from the mass of corrupt and profligate persons who formed the Roman "society" of his age, and vindicated for himself the right to be severe by leading a blameless and exemplary life. His six satires were greatly admired, not only in

Persius' own day, but all through the Middle Ages; but the estimate which modern critics have formed of his writings from a literary point of view is not so high. He is remarkable for the sternness with which he censures the corruption of morals then prevalent at Rome, contrasting it with the old Roman austerity and with the Stoic ideal of virtue. His language is terse, homely, and sometimes obscure, from the nature of the allusions and the expressions used, but the dialogues are the most dramatic in the Latin tongue. The *editio princeps* appeared at Rome in 1470; later editions are those of Isaac Casaubon (Paris, 1605); Passow (Leipzig, 1809); Jahn (ib., 1843); Gildersleeve (1875); Hermann (Leipzig, 1881); Conington (with an English translation and commentary, revised by Nettleship, Oxford, 1893); Bücheler (Berlin, 1893); and Van Wageningen (1911). Persius has been frequently translated, the two best English translations are those by Dryden and Conington. Consult: H. E. Butler, *Post-Augustan Poetry* (Oxford, 1909); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part ii (3d ed., Munich, 1913); also M. H. Morgan, *Bibliography of Persius* (Cambridge, Mass., 1909).

PERSON (OF. *persone*, Fr. *personne*, from Lat. *persona*, person, actor's mask, from *personare*, to sound through, from *per*, through + *sonare*, to sound, from *sonus*, sound; connected with Skt. *svana*, sound, from *svan*, to sound). In theology the word "person" is applied to the distinctions in the divine Trinity in a modified sense. Sabellius applied the Greek word *prosopon* (face) to the Father, Son, and Spirit, on the supposition that they were three separate appearances, or faces, of the one divine nature. In the Trinitarian controversy culminating at Constantinople (381), the orthodox party accepted the term, but affirmed that the "faces" were eternal faces, or were manifestations of eternally existing distinctions. The natural tendency of the word, when "person" had come to mean a separate individuality, was to emphasize the separateness of the Trinitarian hypostases, and in that respect it had a bad influence.

PERSON. In law, a term descriptive of all those who may have legal rights or obligations. It comprehends living men, women, and children, including *en ventre sa mere*, all of whom are called natural persons, and corporations, which are known as artificial persons. The legal capacity of persons, which varies greatly according to age, sex, and status, is commonly dealt with under the head of the law of persons. See CAPACITY, INCAPACITY; ALIEN; HUSBAND AND WIFE; MARRIAGE; INFANCY; BASTARD; DOMESTIC RELATIONS.

PERSON, SECURITY OF. See SECURITY OF PERSON.

PERSONA GRATA (Lat., acceptable person). A term applied to a diplomatic agent, indicating that he is acceptable to the sovereign to whom he is accredited. See DIPLOMATIC AGENTS.

PERSONAL ACTION. In the early history of common-law procedure in England, an action against a person for damages for an injury committed by him as distinguished from an action to recover a specific thing, such as land, of which the plaintiff had been wrongfully deprived, and which was accordingly known as a real (Lat., *res*, thing) action. Hence the kind of property specifically recoverable by such an

action came to be known as real property. Real actions were instituted by writs whose form was determined sometimes by the nature of the wrong which they were aimed to remedy, sometimes by the position of the plaintiff (as disseisee or heir of the disseisee), sometimes by the nature of the remedy sought (as in the case of the writ of right). The action of ejectment never took its place as a real action. The most comprehensive of the personal actions was trespass, to which were afterward added detinue, trover, and case. Later, under the developed common-law system of pleading, the term "personal action" was employed to denote any action available to enforce rights or redress wrongs, including actions to recover possession of personal property, but excluding actions to recover possession of, or involving rights in, real property.

Under the reformed system of procedure, which has come to prevail in England and many of the United States, the distinction between personal and real actions has lost its importance. See ACTION, FORMS OF ACTION; PLEADING.

PERSONAL EQUATION. See EQUATION, PERSONAL.

PERSONALITY. See INDIVIDUALITY, MENTAL CONSTITUTION, SELF.

PERSONALITY, DOUBLE OR MULTIPLE. See DOUBLE CONSCIOUSNESS.

PERSONAL PROPERTY; PERSONALTY.

In the common-law classification of property rights, those that, upon the death of the owner intestate, pass by operation of law to his personal representative, and not, as in the case of real property, to his heir. This classification of property as real and personal, though based fundamentally on the natural distinction between movables and immovables, is essentially artificial in character, having been developed under the pressure of social necessity. Thus, freehold interests in land, as the basis of the feudal system, passed at the death of the holder or "tenant" either to his lord, of whom the land was held, or to his heir, as the person presumably best fitted to discharge the obligations which land tenure involved. Leasehold estates, however, which developed later and which for social reasons were originally not held by free-men, were not based on tenure but on contract (covenant) and never secured recognition as feudal estates. Accordingly, on the death of such a tenant the unexpired term passed not to his heir but, as a "chattel real," to his personal representative. Certain other rights in land, such as the rights of merchant creditors under early statutes in the hand of their debtors, as well as the estate of a mortgagee in mortgaged land, have also been placed in the category of personal property. Generally, however, the term comprehends all, or nearly all, movable things—chattels, such as cattle, goods, wares, and merchandise, moneys, stock, bonds, and other securities, and certain forms of "incorporeal" property, such as patent rights, copyrights, the good will of a business, trade-marks, etc. As personal property is more easily transferable than real property and can more promptly and conveniently be subjected to levy and attachment in the interest of creditors, commercial considerations have in modern times determined the classification of various forms of property as personal which formerly would doubtless have been considered real. Indeed,

in some instances the classification of property, as shares of stock in railroad or in turnpike corporations, has been changed by judicial decision or by statute from real to personal. Property that is personal in its nature may become real by becoming affixed to real property, and in the same way real property may be converted into personal property by severance from the realty.

Title to personal property may be acquired in three ways: (1) by original acquisition, (2) by transfer by operation of law, (3) by transfer by act of the parties.

(1) Property acquired by original acquisition may be acquired: (a) by *occupancy* when one appropriates to his own use a thing which was not then subject to ownership, as in the finding and appropriation of lost property or the capture of wild animals; (b) by *accession*, which is the right which a person has to all the property which his own property produces, as the young of animals, and the right to all property which is annexed naturally or artificially to his own property; (c) by *confusion*, which is the inextricable commingling of other property with one's own property; (d) by *intellectual labor*, which is the source of the property right of authors and inventors in their writings and inventions.

(2) The transfer of the title to personal property by operation of law may be by forfeiture, by sale under execution, by operation of bankruptcy or insolvency laws, by exercise of the right of eminent domain, by marriage, by death of the owner, or by escheat.

(3) Transfer of title to personal property may be accomplished by act of the parties. At common law all that is necessary to transfer an interest in personal property from one to another is intent or mutual meeting of the minds of the parties without writing or other formality. (See CONTRACT; SALE; GIFT.) Modern statutes have made formalities requisite under some circumstances in order to protect the rights of the transferee from the claims of third persons.

For further information as to the various kinds of personal property, the methods of acquisition, and transfer of title thereto, the remedies for injury to personal property, etc., consult such subjects as ADMINISTRATION; CHATTEL; CHOSE IN ACTION; CRIME; DESCENT; EMBLEMENTS; ESTRAY; FERRE NATURE; FIXTURES; FRAUDS; STATUTE OF; LITERARY PROPERTY; MORTGAGE; PATENT; TORT; ETC.

Consult: Pollock and Wright, *Possession*; Schouler, *The Law of Personal Property* (3d ed., Boston, 1896); Brantley, *Principles of the Law of Personal Property* (San Francisco, 1890); Goodeve, *Modern Law of Personal Property* (4th ed., London, 1904); Williams, *Principles of the Law of Personal Property for the Use of Students in Conveyancing* (15th ed., London, 1900).

PERSONAL REPRESENTATIVE. In English and American law, the person who, as executor or administrator, administers the personal estate of a decedent. The term is sometimes employed in a more general sense to denote those who represent others in conducting transactions, as one acting under a power of attorney to vote stock, and also those who succeed to property by assignment, as the assignee of a lessee for years, and sometimes in wills to those who are technically called next of kin

(q.v.), according to the statute of distribution, and, in its broadest use, to all persons who stand in the place of another and represent his interests respecting his property, whether transferred to them by his act or by operation of law.

Primarily and usually, however, the term is used to designate only those persons in whom the personal estate of a decedent vests for the purpose of administering it. More nearly than the heir, upon whom the real estate of an intestate descends, the personal representative (executor or administrator) occupies the position of the Roman *heres*, and it is from the Roman, through the medium of the canon, law as administered in the ecclesiastical courts of England, that the conception of the personal representative in our legal system is derived. He was so called because he represented the *persona*, or individuality, of the deceased, whom by a kind of personification he represented for the purpose of discharging his obligations and carrying out his wishes with respect to his personal estate. However, unlike the *heres* in the earlier civil law, the personal representative was never held liable for any debts of the decedent, except to the extent of the assets received by him. Formerly he was entitled to any surplus of the estate that might remain in his hands after the payment of the debts and legacies, but this has long ceased to be the case, and he must now account for it to those entitled under the statutes of distribution. However, he is still something more than a mere official administrator, as the actual legal title to the personal estate vests in him and remains in him until he has paid it over to those who show themselves to be entitled thereto under the law. His duties and the method and form of his administration are usually particularly prescribed by statute. See ADMINISTRATION; DISTRIBUTION; EXECUTOR; ETC. Cf. HEIR; KIN, NEXT OF.

PERSONIFICATION (from Lat. *persona*, person + *facere*, to make). A figure of rhetoric by which inanimate objects or mere abstract conceptions are invested with the forms and attributes of conscious life. See METAPHOR; RHETORIC, FIGURES OF.

PERSONS, ROBERT. See PARSONS, ROBERT.

PERSEON, pār'sōn, CHRISTIAN HENDRIK (1755-1837). A Dutch physician and botanist, born at the Cape of Good Hope, Africa. He was educated in Holland and practiced his profession for a number of years in Germany. He went to Paris about 1802, where he published several interesting works on cryptogamic plants, also a *Synopsis of Plants* in two volumes. The titles of his principal works are: *Observationes Mycologicae* (1796); *Synopsis Methodica Fungorum* (1801); *Icones Pictæ Specierum Rariorum Fungorum* (1803-08); *Synopsis Plantarum* (2 vols., 1805-07). The Australasian genus *Perseonia* (Proteaceae) is named in his honor. It embraces about 60 species, some of which are valuable timber trees.

PERSPECTIVE (Fr. *perspective*, from Lat. *perspectus*, p.p. of *perspicere*, to see through, from *per*, through + *specere*, to see). The art of representing natural objects upon a plane surface in such manner that the representation shall affect the eye in the same way as the objects themselves. The distance and position of objects affect both their distinctness and apparent form, giving rise to a subdivision of perspective into linear and aerial perspective. The former is strictly scientific and a branch

of applied geometry and, as its name denotes, it considers exclusively the effect produced by the position and distance of the observer upon the apparent form and grouping of objects. Aerial perspective confines itself to the distinctness of objects as modified by distance and light, and belongs to the nonscientific sphere of pictorial representation.

Linear perspective in a picture is obtained as follows: after the scope (i.e., the number of objects to be introduced and the distance at which they are to be viewed) of the picture has been determined, and before the design is commenced, it is necessary to draw upon perspective plan three lines: (1) the base line or ground line, which limits the sketch towards the operator, and may be considered as the base line of an imaginary vertical plane called the picture plane. (2) The horizon line which represents the ordinary position of the sensible horizon. The height of the horizon line is about one-third of the height of the picture, when the sketcher is placed at or a little above the level of the horizon; but it may rise in a degree corresponding to his increase of elevation till it reaches near to the top of the perspective plan. The general rule is to have a high horizon line when the view is taken, or supposed to be taken, from an eminence, but when the station is on a

Fig. 1

Illustrating the more important points and lines. P.V.R. is the principal visual ray; P.D., point of distance; H.L., horizon line, B.L., base line, P.S., point of sight.

level, either actual or assumed, the horizontal line must be low. The horizon line in nearly all cases is supposed to be level with the spectator's eye. (3) The vertical line which is drawn from the supposed position of the sketcher, perpendicular to the ground and horizon lines, meeting the latter in a point which is called the point of sight or centre of the picture. The vertical line has no representative in nature

the picture; but we very frequently find it on the right or left side, though always, of course, on the horizontal line. All lines which in nature are perpendicular to the picture plane raised upon B.L. as a base, meet in the point of sight, which is thus their vanishing point. (See the line of the tops and bottoms of the pillars in Fig. 1.) The points of distance are two points in the horizontal line on each side of the point of sight, and in a direct sketch are at a distance from it equal to the horizontal distance of the sketcher's eye from the ground line. The equality of distance of these points from the point of sight is not, however, necessary, as it occurs only in those cases where the lines, of which the points of distance are the vanishing points, are inclined (in nature) at an angle of 45° to the base line, but in all cases the two points of distance are about twice as far apart as the eye is from the picture. One important use of the points of distance is to define the distance of objects in a row (Fig. 1) from each other. For this purpose two points of distance are not necessary, as, when the position of one pillar is found, that of the opposite is at once obtained by drawing a line parallel to the base or ground line.

There are many other groups of parallel lines in a picture which have different situations and therefore different vanishing points. Such lines with their vanishing points (called, for distinction's sake, accidental points) are represented in Fig. 2. If the accidental point is above the horizontal line, it is called the accidental point aerial; if below, the accidental point terrestrial; and a little consideration makes it evident that these points may or may not be situated within the plane of the picture. Such are the points and lines necessary for the construction of a plan in true perspective; and from the above explanation we may deduce the two general principles. (1) that all parallel straight lines in nature are no longer parallel when projected on the perspective plane, but meet in a point which is called

Fig. 2.

The lines OO_1 converge to the accidental point aerial and PP to the accidental point terrestrial. VP is the vanishing point; HL , horizon line, GL , ground or base line; PVR , principal visual ray.

and is merely a mechanical adjunct to the construction of the picture, all vertical lines in nature being parallel to it in the picture. The point of sight, being the point directly opposite to the observer, is often placed in the centre of

the vanishing point and is some one of the three above described, unless these lines happen to be also parallel to the ground line or the vertical line, in which case they remain parallel when transferred to the picture; and (2) that since the bodies drawn below the horizontal line are seen as if from above, those above as if from below, and those to the right and left of the point of sight as if observed from the left and right, it follows that straight lines which in the picture are above the horizontal line lower themselves, and those below raise themselves to it; those to the left, following the same law, direct themselves to the right and vice versa.

Besides the more usual angular perspective

there is the bird's-eye perspective, when the eye is taken up to an imaginary high level; curvilinear or panoramic perspective, in which the surface of projection is a concave cylinder; spherical perspective, in which the picture plane is replaced by a portion of a concave sphere and all the lines are arcs of great circles or meridians of the sphere, whose respective poles are the vanishing points; and oblique perspective, with its triple horizons and vanishing points.

Aërial perspective consists in a modulation of the brightness and colors of objects in accordance with the state of the atmosphere, the depth of the body in the perspective plane (i.e., distance in nature from the ground line), and other accidents of place and time. As the distance of objects increases their illuminated parts are made less brilliant and their shaded parts more feeble. The bluish tint imparted by a large mass of the atmosphere to the bodies seen through it is frequently imitated by the mixing of a slight tint of blue with the colors to be applied; a yellow object thus assumes a greenish tint, a red one a violet tint, etc. The air, when charged with vapor, is represented by a diminution of the brightness of colors and by the grayish tint imparted to them.

Sculptural perspective refers to the appearance of statuary and reliefs in elevated or distant positions, as in the pediments or metopes of temples, on the façades or spires of churches. The Greeks were consummate masters of this art which was not unknown to the Gothic stone masons, especially in France. Among Renaissance sculptors Donatello was the first to rediscover the art.

Architectural perspective is simply the application of linear perspective to architectural drawing and is a specialized branch of descriptive geometry. The plans, elevations, and sections by which buildings are represented in the working drawings are orthographic projections, which give the correct geometric and dimensional relations of the various parts of the building shown, but present in each case only two dimensions and do not exhibit the natural aspect of the structure as it appears to the eye from any given point of view. This deficiency is supplied by the perspectives, which show its appearance as seen from one or another point of view, all three dimensions being represented, but with the foreshortenings and angular distortions of its actual appearance from the given point. It is customary to make perspectives not merely of the exterior of a projected or executed building, but also of the more important interior portions. See **DRAWING**; **ISOMETRIC PERSPECTIVE**.

History. Knowledge of perspective in all its branches is comparatively modern. Oriental art knew nothing of any branch. A glance at Egyptian and Assyrian reliefs shows that the most elementary principles were ignored. Buildings and trees were laid flat on the ground or stood up in front view; the figures were placed one on top of the other instead of on different planes.

The Greeks first studied and solved some of the mysteries of linear perspective, but it is doubtful whether they ever got beyond the architectural form into the plastic and pictorial forms. This step was reserved for the more realistic art of the Alexandrian and especially the Roman age. The frescoes at Pompeii often exhibit an elaborate attempt to draw buildings

in perspective with varying degrees of unsuccess.

Renaissance art, however, attacked almost immediately the question of linear perspective in all its branches. The architect Brunelleschi laid the foundations of the science, and his theories were further developed in the writing of Leon Battista Alberti. Their maxims were applied to painting, particularly by the realists, Paolo Uccello and his associates. Piero della Francesca excelled in both the theory and practice of perspective and was the first in Italy to master aërial perspective. Consummate masters also were Melozzo da Forlì, Andrea Mantegna, and especially Correggio. See **FORESHORTENING**.

The problem of aërial perspective was first solved by the Netherlands of the early fifteenth century and it appears complete in the landscape backgrounds of the Van Eycks, from whom it passed as a heritage to the school. It was not mastered until 50 years later in Italy. Aërial perspective is particularly important in landscape painting. It was thoroughly understood by the classical as well as the naturalistic schools. (See **LANDSCAPE**.) Among modern painters Theodore Rousseau stands preëminent as a master of perspective.

Bibliography. Of the early treatises the most important are Leon Battista degli Alberti, *De Pictura Libri tres*, edited by H. Janitschek (Vienna, 1877), and Piero della Francesca, *De prospectiva pingendi* (Strassburg, 1899), both of which were first published in the latter part of the fifteenth century. The subject is very fully treated in W. R. Ware, *Modern Perspective* (rev. ed., New York, 1905). Consult also J. A. R. Maillard de la Gournerie, *Traité de perspective linéaire* (Paris, 1898). Gustav Seeberger, *Principien der Perspektive* (7th ed., Munich, 1900); U. Checa, *La perspective* (Paris, 1900); Robert Pratt, *Perspective, Including the Projection of Shadows and Reflections* (New York, 1901); W. H. Lawrence, *Principles of Architectural Perspective* (2d ed., Boston, 1904); G. A. Storey, *The Theory and Practice of Perspective* (Oxford, 1910); Louis Cloquet, *Traité de perspective pittoresque* (3 vols., Paris, 1913). B. J. Lubschez, *Perspective: An Elementary Textbook* (New York, 1913). See **DRAWING**, *Perspective Drawing*.

PERSPECTIVE. In mathematics, a term applied to figures, one of which is formed from another by a single central projection. Thus, if from a point S , exterior to two planes P and P' , a pencil of rays pass through the vertices of a triangle ABC situated in plane P , these rays meet P' in the vertices of a triangle $A'B'C'$ in perspective with the triangle ABC . In general, P cuts P' , and the line of intersection is called the axis of perspective, the point S being called the centre of perspective. If the planes P and P' are brought into coincidence, the triangles, or other figures similarly related, are still said to be in perspective. In two perspective figures a point or line of one corresponds to a unique point or line of the other, hence a curve and its projection are of the same order and the same class (see **CURVE**), e.g., a conic section is always projective, or in perspective with a conic section, although the species may not be the same. Many properties of perspective figures are demonstrated by means of the fundamental proposition: the anharmonic ratio (q.v.) of perspective ranges is constant. See **PROJECTION**.

PERTAB SINGH, pĕr-tăb' sîng, SĪR (1844-). An Indian soldier and statesman, grandson and successor of Maharaja Man Singh of Mahdauna. He was Chief Minister of Jodhpur in 1878-79, accompanied the British mission to Afghanistan in 1880, visited England in 1887, served in the Tirah and Momand expeditions in 1897-98, and was promoted to colonel. In 1900 he was a member of the relief force that marched to Peking. Pertab Singh became Maharajah of the State of Idar in 1901, but in 1911 abdicated to assume the regency of Jodhpur. When the European War broke out in 1914 he accompanied the Indian troops to France to join the British expeditionary army. He was knighted by Queen Victoria and received an LL.D. from Cambridge.

PERTH, pĕrth. The capital of Western Australia, situated on the north bank of the Swan River, 12 miles northeast of Fremantle, on the Eastern Railway. It is flanked on the east by the Darling Range and surrounded by picturesque scenery (Map: Western Australia, B 10). It is the see of Anglican and Roman Catholic bishops. The most notable public buildings are the Houses of Parliament, the Observatory, the Supreme Court House, the Royal Mint, the Stock Exchange, the administration offices, the Police, Civil, and Bankruptcy Court Houses, the Police Barracks, the Governor's residence, Government House, the Town Hall, the Gothic Anglican cathedral, Presbyterian, Wesleyan, and Congregational churches, the Post Office, the Hebrew synagogue and Mohammedan mosque, the Hospital, the Museum, the Victoria Jubilee Public Library, the Theatre Royal, the Bishop's palace, the Roman Catholic cathedral, the High School, the Alexander Scots' College, and the Queen's Hall. Among its several well-kept pleasure grounds the largest is Perth Park. A feature of the approach to the city from the southwestern seaport of Fremantle is the beautiful lakelike reach, the Perth Water. Perth has electric trams, the Queen's Gardens, the King's Park, Zoological Gardens, an Ascot race course, and a fine water supply. Pop. (est.), 1910, 55,000.

PERTH. The capital of Perthshire, Scotland, a city, royal and parliamentary burgh, on the Tay, 48 miles north-northwest of Edinburgh (Map: Scotland, E 3). The charming scenery of the immediate vicinity, the Tay, sweeping southward along its eastern side, and the superb background of the Grampians, on the north, render the site of the Fair City exceedingly beautiful; while the important rôle it has played as capital of the Scottish kings gives it high rank among the cities of Scotland. The river is spanned by two handsome bridges, and there are two beautiful public parks, called the North Inch and South Inch. Among the most interesting public buildings are the church of St. John (whence St. Johnstown, or St. John's Town, the old name of the city); the Episcopal cathedral of St. Ninian's; the county building; the town house, part of which was built in 1210; King James VI's Hospital; the infirmary;

and the city prison. At the head of the South Inch stands the General Prison of Scotland, where all criminals sentenced to imprisonment for long periods are confined. The town also contains a statue of Albert, Prince Consort, a public library, the museum of the Antiquarian Society, a natural-history museum, public seminaries, and other educational institutions. It manufactures linen, winceys, rope, cordage, chemicals, dyestuffs, and ink, and has shipbuilding yards, distilleries, and extensive bleaching fields. It is a good cattle and produce market, and the salmon fisheries on the Tay are very valuable. The total quaysage of Perth harbor is 1225 feet, and vessels of 200 tons can be accommodated. Perth has a charter as a royal burgh from King William the Lion (1165-1214). It was the scene of the murder of the Earl of Cornwall, by his brother Edward III, in 1336; of a combat between two Highland clans (1396), described in Scott's *Fair Maid of Perth*; of the assassination of James I in 1437, notwithstanding the heroic action of Catharine Douglas, who died to prevent the entry of the murderers by making her arm serve in place of the missing bar on the door; and of Knox's Reformation sermon. Pop., 1901, 32,872; 1911, 35,854. Consult Samuel Cowan, *The Ancient Capital of Scotland* (New York, 1904).

PERTH. The county seat of Lanark Co., Ontario, Canada, on the Tay River and the Canadian Pacific Railway, 48 miles southwest (direct) of Ottawa. It has a collegiate institute, municipal buildings, a public library, and athletic park. The industrial establishments include foundries and machine-shops and manufacturing of sashes and doors, aërated waters, felt, carpets, boots and shoes, and knit goods. Pop., 1901, 3588; 1911, 3588.

PERTH, FIVE ARTICLES OF. Articles forced upon the Church of Scotland by King James VI (James I of England) in his attempt to crush Scottish Presbyterianism. At the General Assembly at Perth, Aug. 25, 1618, the Bishop of St. Andrews presided, without election as moderator, dominated the assembly by the men at arms and threats of the King's displeasure, and forced, against great opposition, the acceptance of the five articles. These enjoined (1) kneeling at communion, (2) five holy days—Christmas, Good Friday, Easter, Ascension Day, and Whitsunday, (3) episcopal confirmation, (4) private baptism, (5) private communion. The King tried to enforce the articles, but the majority of the people revolted both from the prelatical customs and from the way they had been carried in assembly. In 1638 the King, alarmed at the spread of the Covenanters, forbade the enforcement of the articles, and the General Assembly in November of that year, meeting in Glasgow, abolished them, along with the Book of Canons, the Liturgy, and the Book of Ordination, as introduced without warrant of either civil or ecclesiastical authority. Consult: W. M. Hetherington, *History of the Church of Scotland* (Edinburgh, 1842); David Calderwood, *History of the Kirk of Scotland*, edited by Thomas Thomson, vol. vii (ib., 1845); P. H. Brown, *History of Scotland*, vol. ii (Cambridge, 1902).

PERTH AMBOY, ăm'boi or ăm'boi'. A city and port of entry in Middlesex Co., N. J., 15 miles south by west of Newark, on Raritan Bay, at the mouth of the Raritan River, and on the

Lehigh Valley, the Central of New Jersey, the Pennsylvania, and the Staten Island Rapid Transit railroads (Map: New Jersey, D 2). It has a fine harbor, which is now (1915) being improved with transportation facilities by water, and controls important shipping interests, particularly in coal. In 1913 Perth Amboy imported \$7,800,000 worth of merchandise, while its exports amounted to \$3,000,000. The manufactures, which are extensive, include terra cotta, bricks, chemicals, oil, cork, copper, iron, steel, and lumber, the first two named being developed from the valuable deposits of fire clay found in the vicinity. There are also two large smelting and refining plants and important shipbuilding interests. According to the thirteenth census, Perth Amboy produces annually \$73,000,000 worth of goods, representing an invested capital of \$25,000,000 and giving employment to about 6600 persons. The city-hall park, Carnegie library, city hospital, Washington's statue, and the bridge of the New Jersey Central Railroad are among the features of Perth Amboy. The government is administered, under a charter of 1871, by a mayor, elected every two years, and a council which has powers of election and confirmation in important administrative offices. The water works are owned and operated by the municipality. Pop., 1890, 9512; 1900, 17,699; 1910, 32,121; 1914 (U. S. est.), 38,265.

Perth Amboy was settled in 1683 and was expected soon to outstrip its neighbors and become the London of America. It was named Perth, after James, Earl of Perth, but Amboy, the original Indian name for the place, was soon added. It was the capital of the province from 1684 almost continuously up to the time of the Revolution. William Franklin, the last royal Governor, was captured here in 1776. Perth Amboy was incorporated as a city in 1718. Consult W. A. Whitehead, *Contributions to the Early History of Perth Amboy* (New York, 1856).

PERTHES, pâr'tás, FRIEDRICH CHRISTOPH (1772-1843). A German publisher and patriot. He was born at Rudolstadt. In his fifteenth year he was apprenticed to a Leipzig bookseller, with whom he remained six years. In 1793 he was employed by Hoffman, the Hamburg bookseller, and in 1796 started business on his own account and developed an important publishing business. The rule of the French in northern Germany, and the prohibition of intercourse with England, nearly ruined trade, yet Perthes found ways and means to extend his business. He endeavored to enlist the intellect of Germany on the side of patriotism, and in 1810 started the National Museum. Its success was far beyond Perthes's expectations, and encouraged him to continue his patriotic activity, till Hamburg was formally incorporated with the French Empire. He subsequently took a prominent part in the movement that forced the French garrison to evacuate Hamburg, March 12, 1813; and on its reoccupation by the French he was one of the 10 citizens who were specially excepted from pardon. In 1822 Perthes removed to Gotha, where he devoted himself to the publication of historical and theological works. He was the prime mover in the organization of the German book trade and in the foundation of a museum connected therewith. His correspondence with literary, political, and theological notables is extremely interesting and throws light upon the inner life of Germany early in the nine-

teenth century. Consult C. T. Perthes, *Life and Times of Friedrich Christoph Perthes* (Eng. trans., London, 1858).

PERTHITE. A red flesh-colored feldspar, consisting of interlaminated orthoclase and albite, that is found in Perth, Canada. It often affords bright aventurine reflections, and consequently is in some demand as a gem. See ORTHOCLASE.

PERTH'SHIRE. An east midland county of Scotland, bounded north by Inverness and Aberdeen, east by Forfar, Fife, and Kinross, south by Stirling and Clackmannan, and west by Argyll and Dumbarton (Map: Scotland, D and E 3). Area, 2493 square miles, largely highlands. The Grampian Mountains here reach altitudes of 3843 and 3984 feet respectively in Ben More and Ben Lawers. The lakes are numerous and include Lochs Tay, Erich, Katrine, and Achray. The entire region has been immortalized as the country of Scott's *Lady of the Lake*. The principal rivers are the Forth and the Tay. Old red sandstone, granite, and slate abound; in the lowland districts the soil is composed mostly of a rich loam, in which crops of all kinds are brought to perfection; only about one-fifth of the total area, however, is under cultivation. The highland districts are devoted chiefly to sheep pasturage and extensive deer forests. Stock raising is largely carried on. The chief industries are the manufacture of textiles, bleaching, and dyeing. Capital, Perth. Pop., 1901, 123,283; 1911, 124,342.

PERTINAX, PUBLIUS HELVIUS. Emperor of Rome. He was born, according to Dio Cassius, at Alba Pompeia, a Roman colony of Liguria, 126 A.D. He received a good education and, entering the military service, rose through the various grades till he obtained the command of the First Legion, at the head of which he signalized himself in Rhætia and Noricum against the native tribes. In 179 or, according to other authorities, in 172, he was chosen consul, aided in repressing the revolt of Avitus in Syria, and was governor successively of the provinces of Mœsia, Dacia, and Syria. He was sent by the Emperor Commodus to take the command of the turbulent legions in Britain, and these troops, against his will, proclaimed him Emperor; on which he solicited a recall, and was appointed proconsul of Africa, prefect of Rome, and consul (a second time) in 192. On the death of Commodus his assassins almost forced Pertinax to accept the purple, which with great hesitation he did (Jan. 1, 193), but, in spite of his promise of a large donation, he was unable to gain over the Prætorian Guard. His accession was, however, hailed with delight by the Senate and the people, who were rejoiced to have as ruler an able captain instead of a ferocious debauchee; and Pertinax, encouraged by this favorable reception, announced his intention of carrying out an extensive series of reforms, having reference chiefly to the army, in which he hoped to reestablish the ancient Roman discipline. Unfortunately, he was attacked by a band of the rebellious prætorians, about three months after his accession, and, disdaining to flee, was slain (March 28, 193). His head was carried about the streets of Rome in triumph.

PERTURBATIONS (Lat. *perturbatio*, confusion, from *perturbare*, to confuse, from *per*, through + *turbare*, to disturb, from *turba*, throng, tumult). In astronomy, a term used to

describe disturbances in the orbital motion of the planets or other celestial bodies. The simplest kind of motion imaginable under the law of gravitation would be that of a small material particle revolving about a larger central attracting body. If this particle is so small that its mass may be neglected altogether, as being inappreciable in comparison with that of the central body, then the particle will describe an elliptic orbit having the larger body in one of its foci. If, however, both bodies have masses so large that neither is negligible, then each body will describe an elliptic orbit having the common centre of gravity of the two bodies in the common focus, and its distance from either body will be inversely proportional to that body's mass. Thus the larger body will describe proportionally the smaller orbit. The problem of determining mathematically all the circumstances of motion in such a system is called the problem of two bodies, and its complete solution is possible. When the number of bodies in a system is increased to three we have the famous problem of three bodies, the complete mathematical solution of which has never been effected. It is not even certain whether our inability to solve this problem completely is due to the lack of sufficient power in the known methods of mathematical analysis or to the fact that the problem is actually insoluble. Fortunately, astronomers have been able to obtain an approximate solution of the problem as it actually exists in the solar system, and this approximate solution is sufficiently exact for all practical purposes of predicting planetary phenomena. This solution is made by taking advantage of the fact that all the planets in the solar system are very small in comparison with the central body, the sun. The effect of this is to make such planet describe an orbit very nearly the same as the elliptic curve in which it would move if that planet and the sun were the only bodies in the system. Consequently, astronomers can predict planetary phenomena on the assumption that the orbit is a true ellipse, and then calculate the small disturbances or perturbations produced by the gravitational attraction of the other planets in the system. The continuing action of perturbative attraction may in time produce certain changes in the size, shape, and position of an orbit.

The principal planetary perturbations are of several kinds: some change a planet's position on the sky alternately forward and backward every few years (periodic perturbations); others require a longer cycle to act forward and backward (long inequalities); and lastly there are the secular inequalities, whose effects are so slow that hundreds of thousands of years are included in their cyclic action. The planetary periodic perturbations may displace the planets as seen from the sun by 15" in the case of Mercury, 30" for Venus, 60" for the earth, and 120" for Mars. The most important long inequality is that existing between Jupiter and Saturn. It may displace the former planet 28' and the latter as much as 48'. The long-period secular inequalities do not alter either the mean distances of the planets from the sun or their periods of revolution. But the nodes (see NODE) and perihelia of the orbits move continuously. The perihelia of all the planets except Venus are gradually increasing their celestial longitudes, and all the nodes are moving in the opposite direction on the ecliptic. At

the same time the inclinations of the planetary orbits to the ecliptic plane are oscillating through narrow limits in very long periods of time and the eccentricities are similarly affected. But, on the whole, the mathematical researches so far made indicate that the continued effect of gravitational perturbative action will not end in the disruption of our solar system. But its permanent existence might be jeopardized by other than gravitational forces, or by forces operating from outside the system. In the case of the moon perturbations are more complex and larger than they are in the planetary orbits. The moon is so near us that the slightest error in her predicted position is observed with ease and certainty, and therefore her motion offers a much severer test to mathematical calculations than do the planetary phenomena. Consult F. F. Tisserand, *Traité de mécanique céleste* (4 vols., Paris, 1889-96). See MOON.

PERTUS/SIS. See WHOOPING COUGH.

PERTY, pâr'tê, JOSEPH ANTON MAXIMILIAN (1804-84). A German zoölogist and philosophical writer, born at Ohrbau in Middle Franconia. He studied medicine and natural history at Landshut and Munich, in 1833 became a professor in the University of Bern, and subsequently was made rector. His principal works are: *Allgemeine Naturgeschichte als Philosophische und Humanitätswissenschaft* (1837-44); *Die mystischen Erscheinungen der menschlichen Natur* (1861; 2d ed., 1872); *Ueber das Seelenleben der Tiere* (1869; 2d ed., 1875); *Blicke in das verborgene Leben des Menschengesistes* (1869); *Die Anthropologie als die Wissenschaft* (1873-74); *Erinnerungen aus dem Leben eines Natur- und Seelenforschers des 19. Jahrhunderts* (1879).

PERTZ, pèrts, GEORG HEINRICH (1795-1876). A German historian. He was born at Hanover, studied at Göttingen, and at 24 published an authoritative *Geschichte der merowingischen Hausmeier* (1819). Four years afterward Pertz was appointed secretary of the royal archives of Hanover and began his important research in mediæval German history as editor of the *Monumenta Germaniæ Historica*. Most of the materials for the Carolingian period were edited personally by Pertz, and an account of his travels and preliminary research was published in the *Archiv der Gesellschaft für ältere deutsche Geschichtskunde* (1824 et seq.). He resigned his post as editor in 1874. Pertz had become librarian and keeper of the Hanoverian archives in 1827, royal librarian in Berlin in 1842, and wrote biographies of Stein (1849-54) and of Count von Gneisenau (1864-69). With Grotefend he edited Leibnitz's works (1843-47). Consult article in *Allgemeine deutsche Biographie*, vol. xxv (Leipzig, 1887).

PERU, pè-rōō' (corrupted from *Biru*, name of a chief of the early sixteenth century, who ruled a small territory of South America near the Isthmus of Darien). One of the four countries of South America bordering on the Pacific Ocean. It is bounded on the north by Ecuador, on the east by Brazil and Bolivia, on the south by Bolivia and Chile, and on the west by the Pacific Ocean. Its frontiers on the north, east, and south cannot be exactly defined throughout their whole extent on account of boundary disputes with Ecuador, Bolivia, Chile, Brazil, and Colombia, most of which are in process of settlement. The coast line, however, is not affected by these disputes except for a comparatively

short distance in the extreme south. The area is estimated by the Lima Geographical Society at 683,335 square miles, but other estimates give as low as 439,014 square miles. The length of the coast line conceded to belong to Peru is about 1100 miles, not reckoning sinuosities.

Topography. Extending north and south through Peru are three well-marked topographic divisions: the Coast Desert, the region of the Andes, and the Montaña or tropical forested plain east of the Cordilleras and included in the basin of the Amazon. The *Zona seca* (dry zone) extends along the Pacific coast from lat. 3° S. (south Ecuador) through Peru to lat. 22° S. in north Chile. Most of this sandy desert is only 20 miles in width, but in the north it is 120 miles wide. It gradually rises from the Pacific to nearly 1000 feet, where it merges with the foothills of the Andes. It is destitute of vegetation except where crossed at intervals by rivers, which rise among the snow tops of the Andes. The banks and valleys of these roughly parallel streams are covered with perpetual vegetation, ribbons of green among the desert waste. Here are many estates and plantations. The desert is whitish in color, owing to the large admixture of marine shells. On the sea margin steep cliffs generally rise, and the waste behind them is slightly undulating, with ridges of considerable height rising here and there. The surface is hard, excepting near the coast, where drifting sea sands are whirled aloft by the winds in clouds of dust. The coast is fairly supplied with harbors well sheltered from the sea, but at many small ports the ships of the coasting trade roll uncomfortably in open roadsteads. The bays of Paita, Sechura, Chimbote, Callao, Samanco, and Norato are secure land-locked havens, where the largest vessels may find shelter.

The region of the Andes is about 250 miles in width. It contains enormous chains of mountains, between which are elevated plains and table-lands, warm and fertile ravines and valleys. The mountain system consists of three Cordilleras extending from northwest to southeast, more or less parallel with the line of the coast. The two western chains, for long distances comparatively near each other, are identical in origin and have been separated by denudations in the course of many ages. On these Maritime and Central Cordilleras are the volcanoes and many thermal springs. Some peaks of the maritime range rise to a height of 15,000 feet. The Sierra, a name that is not applied to any particular cordillera in Peru, designates the region between the maritime and central ranges, rising from 4000 feet, where it abuts on the western, to 10,000 feet at the central mountains. This region, from 50 to 150 miles wide, is a high, broken plain, corresponding to the temperate zone of Mexico, and is best adapted for settlement by whites of the temperate zones. The central range, with culminating peaks 19,000 feet above the sea, is for the most part a distinct water parting between the Atlantic and Pacific drainage systems, though a few Pacific streams rise to the east of this line of summits. Between the central range and the Eastern Cordillera is the Puna (signifying "hard breathing"), a broken plain rising from 9000 feet at its west edge to 14,000 feet at the edge of the great Eastern Cordillera of the Andes, where several of the grandest mountains of the continent are found, some of them over-

looking the northern plain of Bolivia, rising 20,000 feet. On the Puna rise a number of the great southern headwaters of the Amazon. The Peruvian Andes increase in height from north to south and from west to east.

The eastern part of Peru drops steeply from the Cordilleras to the plain of the upper Amazon, called the Montaña, 800 miles in length, covered with subtropical forests, where it joins the mountains, and with dense tropical vegetation on the plain, which is cut by the eastern frontier. The Montaña is very rich in rubber and agricultural resources, with abundant navigation, and promises to be one of the most prosperous parts of Peru, though it has yet reached only the early stages of development.

Hydrography. The dry west and the rainy east of Peru naturally produce a striking contrast between the hydrographic aspects of the west and east slopes of the country. There are over 40 streams flowing into the Pacific, all torrential in character, small of volume, and fed by the snows of the Cordilleras. The most important is the Santa, which rises, not on the west slopes of the mountains, like most of the coast rivers, but in a long valley between the maritime and central ranges. During the flood the Santa discharges such an enormous quantity of water that it is difficult to cross. Most of the coast rivers are quite short, and their great value is derived wholly from the facilities they afford, by means of irrigation, for turning belts of the desert into the most fertile of lands. The more important among them, from north to south, are the Chira, the Piura, the Santa, the Rimac, which created the fertile plain on which Lima stands, and the Río Grande.

The Amazonian affluents of the east slope, on the other hand, constantly increase in volume with distance from their sources. The rivulets among them carry more water than most of the Pacific streams. The upper parts of these rivers are interrupted by cascades and rapids, and thus the economic periphery of east Peru is largely determined by the line joining the heads of navigation on these many rivers. All the very numerous rivers of the east slope of Peru are included in the Amazon basin and belong to one or another of the secondary basins of the Marañón, the Huallaga, and the Ucayali (these three are entirely in Peruvian territory), the Purus, the Madre de Dios, and the Madeira. The Marañón is usually regarded as the main upper branch of the Amazon, not because it carries so much water as the Ucayali, but because it prolongs farthest towards the Pacific the longitudinal axis of the Amazon. Ocean steamers now regularly ascend the Amazon and Marañón to Iquitos, Peru, 2500 miles from the Atlantic, and light-draft steamers prolong navigation for 825 miles up the Ucayali and Pachitea rivers. The most important lake is Titicaca (q.v.), which lies partly in Bolivia; it is 12,500 feet above sea level and affords navigation between Peruvian and Bolivian ports on its shores. Junín and many other small lakes are found in the plateau region.

Climate. The chief determining influences on the climate are the trade winds and the great differences in elevation. The country is more temperate than might be expected from its position in the tropics. The trade winds coming west from the Atlantic deluge the eastern mountains, drop cold rain and snow upon the Puna, give a smaller supply of water to the central

range, and moisten the plain of the Sierra to some extent. So little water is left for the maritime range that it is included with the coastal desert in the dry belt. These facts explain the aridity of the west slope of Peru. Once in seven or eight years a marvelous change comes over the face of this desert. Sufficient rain comes over the mountains to bring life out of the parched surface; grass and flowering plants appear, attracting thousands of cattle and goats from the irrigated valleys to the new pasturage, which withers again in a few weeks. Only about $1\frac{1}{2}$ inches of rain fall in Lima in a year. The mean annual temperature of the coast provinces is 68° F. In the hottest months, January and February, the mean temperature is between 82° F. and 86° F. The dry heat is not oppressive, and after 11 A.M., when the torrid sun has rarefied the atmosphere over the desert, sea air comes rushing to this area of low pressure, all life is refreshed by the breeze, and often a little rain is scattered over the maritime range. In the evening, when the surface of the desert grows cool, the wind sets to sea again, bringing cool breezes from the mountains. Conditions are nowhere unhealthful excepting in the low, hot plains of the north and east. The whole mountain region lying between 3000 and 9000 feet above the sea has a temperate and healthful climate.

Flora. Varying with the climate, the flora of Peru is represented on the dry coast only by a few gray herbs and in the depressions by the *Prosopis*, a low tree of scraggy growth, and two shrubs, the *Capparis* and a variety of *Apocynum*. The west slopes of the maritime range, exposed to fogs and occasional rains, have sufficient vegetation to give them a green aspect mixed with yellow due to the abundance of yellow marguerites. The high plateaus among the mountains have a great variety of species, among which resinous and other herbs and the gigantic cactus are especially abundant, and several varieties of forest trees are found. The flora of every zone is represented among the mountains, from the tropical in the deep gorges to the Arctic approaching the snow line. The potato thrives, and the llama, vicuña, and sheep feed on the grasses of the uplands. The most valuable plants economically are the quinine-yielding cinchona; the coca plant, from which cocaine is derived, the *Siphocampylus*, a plant 50 feet high, from which Peruvian rubber is extracted, and the sarsaparilla.

Fauna. The headlands of the coast and the neighboring islands are the home of myriads of sea birds, whence came the immense deposits of guano that were long a great source of Peruvian wealth. Among them are the guano bird (*Sula variegata*), a large gull (*Larus modestus*), a tern (*Sterna inca*), and several cormorants. Sea lions (*Otaria forsteri*) are common on the promontories and islands. The domesticated llama and alpaca and the wild vicuña belong especially to the mountain regions; among the other animals of the highlands are the taruco, a deer, the viscacha, a large rodent, the atoc, a species of fox, the puma, and two species of bear. The largest bird is the condor; another bird of the vulture family, whose black and white wing feather was used by the Incas in their headdress, is the coraquenque. Woodpeckers, a species of partridge, geese, a plover, two kinds of ibis, gulls, water hens, finches, and parrots are also found. Nearly all the char-

acteristic animals of tropical South America are found in the Montaña, including monkeys, the tiger cat, jaguar, tapir, peccary, tortoise, alligator, manatee, vipers, and other snakes.

Geology and Mineral Resources. Sections of the desert zone, exposed along the coast and valleys for several hundred feet, reveal nearly horizontal layers of calcareous sandstone above strata of pudding stone and shell marl, beneath which are beds of argillaceous shale, considerably tilted and often of immense thickness. The ridges found on the coast plain are of granite or syenite. The Maritime and Central Cordilleras consist chiefly of crystalline and volcanic rocks on each side of which are sedimentary strata, principally of Jurassic age. The Eastern Cordillera is in great part of Silurian formation, with talcose and clay slates, many quartz veins, and intrusions of granite rocks. The igneous cones of Peru are found in the southern section of the maritime and central ranges, about 1200 miles south of those in Ecuador. None of them has been in eruption in recent times. Sara-Sara, Achatayhua, Coro Puna, Ampato (all over 13,000 feet), Chachani (19,820 feet), and Misti (about 20,000 feet) are quiescent and snow-clad. Misti, a magnificent cone, near whose base stands the city of Arequipa, appears to be the focus from which some of the earthquakes that afflict Peru have been propagated. South of Misti is the elongated crest of the volcano of Omate, in the seventeenth century the most active of the Peruvian volcanoes. Farther south is Tutupaca (18,960 feet), which as late as 1862 was still ejecting vapors by which a little sulphur was deposited. The frequent and severe earthquakes are most destructive in the neighborhood of these southern volcanoes. In 1746 Callao and in 1868 Arequipa were destroyed by earthquakes. The shocks of 1877 were equally severe, and all the southern ports were overwhelmed by earthquake waves.

Peru is a vast storehouse of mineral wealth, though it long ago lost the first rank as a mining country, and its mineral output is now far surpassed in value by the tin of Bolivia and the nitrate of Chile. The Eastern Cordillera contains gold in the quartz veins of the Silurian strata, but the annual yield is small because the richest mines occur in the most unhealthful and remote parts of the Montaña. The Central and Maritime Cordilleras are poor in gold, but rich in silver, which occurs nearly always with antimony, copper, and lead. Copper is found in great abundance. On the coast lands are important areas of salt, borax, and petroleum (in Piura). Anthracite and bituminous coal are reported in the Hualgayoc district and are known to exist in the Huamachuco and other districts. Copper has superseded silver as the most valuable mineral product. The principal centre of both silver and copper mining is the Cerro de Pasco district, which produced \$475,000,000 of silver between 1630 and 1849. Other important silver-mining centres are those around Puno and at Caylloma, Castrovirena, and Recuay. American and British companies are largely interested in the mining industry. The number of mines has greatly increased of late. The value of the total mineral production during 1905 was \$7,960,000, the value of the leading products being as follows: silver, \$3,152,500; copper, \$3,027,000; gold, \$472,000; crude petroleum, \$604,000; coal, \$478,000. The

output of petroleum in 1913 was 1,857,355 barrels. In 1912 the output of copper was valued at \$9,825,000; silver, \$5,153,000. The output of fine copper in 1912 was about 27,840 metric tons and in 1913 about 27,940 tons. Extensive and valuable guano deposits occur on islands off the coast.

Agriculture. The chief crops of the fertile coast valleys are sugar, cotton, and coffee. Sugar and cotton are the great export crops and form the basis of agricultural prosperity. The unoccupied land capable of producing sugar is measurable only by the possibilities of irrigation, which is being extended. In 1911 and 1912 respectively the reported sugar output was 178,533 and 192,754 metric tons. Cotton is indigenous, and that grown in the northern provinces is distinctive (tree cotton), the plant often reaching a height of 20 feet and producing for 7 to 10 years, the fibre ranging in color from pure white to dark brown. This cotton is especially valued for mixing with fine wool, to which it adds strength, lustre, and protection against shrinkage. Its value is greater than that of any other cotton excepting American sea island. The ordinary staple grown in the coast valleys farther south is adapted for spinning fine yarns. Extensive irrigation works both north and south are now being developed to enlarge the area of cotton culture, and the product is steadily increasing. The reported cotton output in 1913 was 52,345,000 pounds. Rice and tobacco are important crops, and there are several large establishments for the preparation of rice for market. Maize and alfalfa, vegetables, and fruits of all kinds are cultivated in every valley. Grape culture is increasing, and the production of wine is important. Olives are grown in the south, and there are many profitable grazing farms in the coast valleys. In the valleys and to some extent on the plateaus of the Andean region wheat and barley ripen, the potato is a very successful crop, and the cultivation of coffee is a growing industry. The cultivation of the cacao tree is especially successful in the valley of the Pénen River in the Montaña. Rubber is shipped from the Montaña, whose other chief products are cinchona, dyes, and medicinal substances, all the exports going down the Amazon from Iquitos. The coca tree thrives best near the Pacific in the Department of La Libertad.

Manufactures. There are woolen mills at Lima and Cuzco, making blankets, army uniforms, and undergarments. Callao and its suburbs have many factories, chiefly of cigarettes, chocolate, petroleum oils, candles, soap, etc. Wine making is an important industry of the country, and there are a number of flour and lumber mills, and furniture factories. Sugar is produced in considerable quantities from the cane and cocaine from the coca plant. The Indians of the north make fine straw hats, which enter the trade as Panamas. Indians on the mountain plateaus make coarse woolen fabrics and earthenware for local consumption. A few coast towns produce filigree and other fancy articles. The quantity of petroleum refined is increasing. Owing to the small variety and quantity of home manufactures, it is necessary to import a great deal of machinery and wares of all kinds.

Commerce. Peru's business relations with foreign countries have increased notably in recent years. The following table shows the value

of imports and exports, in libras (the libra is equal to the pound sterling, \$4.8665):

	1908	1910	1911	1912	1913
Imports:					
5,311,973	4,980,697	5,438,247	5,140,339	6,088,776	
Exports:					
5,478,941	7,074,076	7,416,028	9,438,571	9,187,780	

The larger classified imports in 1910 and 1913 respectively were as follows in thousands of libras: tools, machinery, vehicles, and ships' stores, 184 and 923; comestibles, 734 and 753; metals and metal manufactures, 449 and 726; cotton textiles and manufactures, 588 and 688; stone, earth, coal, glass, etc., 122 and 510; paints, dyes, gums, etc., 80 and 364; wool and manufactures, 213 and 302; drugs, etc., 113 and 212.

The total mineral export in 1909 is reported at 1,663,424 libras; in 1910, 1,922,460; in 1912, 2,212,000. The export of copper and silver bars in 1910 were valued at 1,236,694 libras; in 1911, 1,210,903. The principal nonmetallic exports have been as follows, in thousands of libras:

EXPORTS	1910	1911	1912	1913
Cotton	1,015	1,028	1,043	1,424
Sugar	1,382	1,225	1,394	1,380
Rubber	1,279	612	1,308	816
Wool, alpaca		214	213	323
Hides	91	108	127	191
Wool, sheep	145	106	146	170
Wool, llama	71	85	26	161
Straw hats	121	441	433	119
Cottonseed	22	22	39	106
Rice	46	82	59	78

In the sugar trade Peru has the great advantage that the fields are cheaply irrigated and the absence of rain permits grinding for three-fourths of the year. Raw sugar is therefore produced at small cost. About five-sixths of the crop is exported, Great Britain, the United States, and Chile being the largest buyers. The distinctive qualities of Peruvian cotton create a demand for it in the leading woolen centres of the United States and Europe. Coffee exports are not expanding, because most of the plantations are on the Andes slopes and transportation by mule train to the railroads is very expensive.

Imports and exports by principal countries are reported as follows, in thousands of dollars:

COUNTRIES	Imports		Exports	
	1910	1913	1910	1913
United States	4,484	8,531	9,878	14,742
United Kingdom	8,158	7,769	12,234	16,539
Germany	3,843	5,132	1,741	2,967
Belgium	1,218	1,867	816	1,213
France	2,361	1,363	3,751	1,568
Italy	815	1,237	5	8
Chile	740	1,036	4,524	6,047
Bolivia			970	640

Imports and exports by principal ports in 1913, in thousands of libras: Callao, 3891 and 3907; Iquitos, 387 and 763; Mollendo, 581 and 1105; Salaverry, 479 and 924; Paita, 315 and 1202; Eten, 204 and 365; Pisco, 136 and 663.

The trade with the United States for 13 years was as follows: exports from Peru in 1900, \$4,774,480; 1905, \$3,657,000; 1913, \$8,-

542,000; and imports into Peru: 1900, \$1,487,180; 1905, \$3,153,000; 1913, \$14,761,000.

Transportation and Communications. Foreign vessels call at nearly all the seaports, the chief of which is Callao. The vessels entering that port in 1912 numbered 562, of 1,387,919 tons. About one-half of the tonnage of foreign vessels was British. The steamships of the Pacific Steam Navigation Company, on the route between Chile and San Francisco, call at nearly all the Peruvian ports. Very little freight is carried in domestic bottoms, the merchant marine of the country in 1911 consisting of only 11 steamers, of 12,673 tons net, and 60 sailing vessels (over 50 tons), of 31,453 tons.

Good wagon roads and bridges are among Peru's greatest needs. Western Peru is still almost isolated from the Montafia because the road on which a vast sum has been spent to connect Oroya, the terminus of the Central Railroad with the Pichis River, the head of navigation leading to Iquitos, is not yet in a satisfactory condition. The railway between Oroya and the great mining centre of Cerro de Pasco, 68 miles, is now open for traffic.

Peru in 1912 had 1719 miles of railway in operation, of which 1150 miles were worked by the Peruvian Corporation, which manages all the property turned over in liquidation of the national debt. Not only Lima, but also the larger inland towns are connected by rail with their seaports, but the country needs branches extending north and south to connect the Andean towns with the routes to the sea and with one another. Peru thus has numerous sections of a railroad system, but owing to the lack of branches between them the railroads are as yet wholly inadequate for the needs of the country. The greatest railroads are the line from Callao and Lima across the Maritime and Central Cordilleras to Oroya, 138 miles, with many tunnels, enormous bridges, embankments, and cuttings; and the railroad between the port of Mollendo and Puno on Lake Titicaca, on which there is a connection by steamers with Bolivia. The Oroya Railway, begun in 1869, reaches an elevation of 15,665 feet, where the divide is crossed through the Galera Tunnel, at mile 106 from Callao. The Morococha branch attains an elevation of 15,865 feet, the highest railway point in the world. At Oroya the road divides, one branch going north to the Cerro de Pasco copper mines, and the other 80 miles south to Huancayo. Still another branch, which will be some 300 miles long when completed, is under construction to the head of navigation on the Ucayali River, an important upper tributary of the Amazon. From Huancayo an extension is planned to Cuzco, which has rail connection with Mollendo. Telegraphs in 1915: lines, 16,800 kilometers; offices, 340, mostly in control of the state. There is a radiotelegraphic system, with stations at Iquitos, Putamayo, Requena, Orellana, Masisea, Puerto Bermúdez, Callao, Lima, Pisco, Chala, and Ilo. Post offices in 1915, 800. Electric communication with the rest of the world is supplied by the cables along the coast, with stations at Paita, Callao, Lima, Barranco, and Mollendo.

Banking. The commercial banks of Peru include the Bank of Peru and London (paid-up capital, 500,000 libras); the Italian Bank (capital, 200,000 libras); the International Bank of Peru (capital, 100,000 libras); and the Banco Popular del Peru (capital, 150,000 libras). The

only savings bank has deposits amounting to over 200,000 libras.

Education. The free public-school system has been under the control of the national government since 1905, but on account of financial stress was abandoned temporarily to the municipalities in 1914. Elementary education is nominally compulsory, but apparently the majority of children do not attend school, and illiteracy is prevalent. Public primary schools in 1913 are reported at 2253, with 3063 teachers, with an enrollment of about 150,000. In 1911 there were 27 national *colegios* (secondary schools), with an enrollment of 4674 students, of whom 2077 were in preparatory courses. There are also numerous private schools of various grades, and several institutions for technical or special instruction. At Lima is the University of San Marcos, founded in 1551, with faculties of law, medicine, theology, philosophy and letters, mathematics and science, and political and administrative science. There are other universities, at Arequipa, Cuzco, and Trujillo. Lima has a notable public library.

Religion. The religion of the state is Roman Catholic, and the constitution prohibits the public exercise of any other religion; practically, however, there is considerable toleration, and Callao, Lima, and Cuzco have Protestant churches and missionary schools. The non-Catholic population probably does not number over 30,000.

Finance. Although the country is possessed of sources of great wealth, Peruvian finance presents in large part a disastrous history, owing to war and mismanagement. Revenue and expenditure for 1910 amounted to 2,795,775 and 2,685,322 libras respectively; for 1912, 3,425,543 and 3,493,629; estimates for 1914, 3,547,836 and 3,109,836. The estimated revenue for 1914 was made up as follows: customs, 1,505,112 libras; taxes, 730,428; monopolies (including salt), 740,728; posts and telegraphs, 166,720; miscellaneous, 404,848. The estimated departmental expenditures were: finance and commerce, 888,224 libras; war and marine, 832,386; administration, 510,613; justice and public instruction, 481,345; public works, 200,511; legislature, 107,943; foreign affairs, 88,814.

In 1870 and 1872 Peru contracted in England two loans, amounting to \$32,688,320. Including interest arrears, the debt in 1889 stood at \$55,209,133. In 1890 Peru was released of responsibility for this debt, the bondholders forming themselves into the Peruvian Corporation, to which was ceded for 66 years the state railways and certain rights over guano deposits, mines, and immense tracts of land. The terms of the contract were not carried out by either party, and in 1907 another agreement was signed, whereby the government engaged to pay the corporation £80,000 annually for 30 years, and the corporation undertook to proceed with railway construction. Various matters were reserved for subsequent arrangement.

In 1913 the foreign debt, contracted in 1911, amounted to £1,162,700; internal debt, £2,660,645 at 1 per cent and £1,132,210 without interest; floating debt, £5,392,457.

Money, Weights and Measures. Peru adopted the gold standard in 1901. Both the pound sterling and the national gold coin, the libra, which is of the same standard and weight, are legal tender. The par value of the libra is \$4.8665. The silver sol is one-tenth of a

libra; silver is legal tender up to 100 sols. In 1914 issues of paper money were made, which on account of the financial situation at once depreciated in value. Spanish standards of weight and measure are still in use, though the metric system was established by law in 1860 and is employed in the customhouses.

Population. There has been no census since 1876, when the population was given at 2,660,881, of whom about 13.8 per cent were white, 1.9 negro, 57.6 Indian, 24.8 mestizo, and 1.9 Asiatic, chiefly Chinese. To all appearances the population is increasing very slowly, if at all. Immigration from Europe, which is promoted by the Peruvian Corporation, is very small.

The list of departments, with their approximate area, capitals, and population (estimated in 1915), is given as follows:

DEPARTMENTS AND PROVINCES	Square miles	Population	Capital
Amazonas	13,940	53,000	Chachapoyas
Ancachs	16,562	317,000	Huáras
Apurímac	8,187	133,000	Abancay
Arequipa	21,947	172,000	Arequipa
Ayacucho	13,185	227,000	Ayacucho
Cajamarca	12,540	333,300	Cajamarca
Callao*	14½	35,000	Callao
Cuzco	89,447	300,000	Cuzco
Huancavelica	9,250	167,840	Huancavelica
Huánuco	14,024	109,000	Huánuco
Ica	8,713	68,200	Ica
Junín	23,350	305,700	Cerro de Pasco
Lambayeque	4,614	93,000	Chilclayo
Libertad (La)	10,206	188,000	Trujillo
Lima	13,310	250,000	Lima
Loreto	172,059	120,000	Iquitos
Madre de Dios	25,500	16,000	Maldonado
Moquegua*	5,550	32,000	Moquegua
Piura	16,825	155,000	Piura
Puno	27,979	270,000	Puno
San Martín	30,745	33,000	Moyabamba
Tacna†	1,990	8,000	Tumbes
Tumbes*	1,990	8,000	Tumbes
Total	544,404½	3,386,040	

* Provinces.

† Disputed with Chile.

Government. For political purposes the Republic of Peru is divided into 19 departments and 3 provinces, and these departments in turn are subdivided into 104 provinces. The present constitution, based on that of the United States, was proclaimed in 1856 and revised four years later. Under it the executive power is vested in a President, who must be 35 years of age and a native Peruvian, elected by direct vote for four years, and two Vice Presidents elected for the same period. The President is ineligible for two consecutive terms. He is assisted by six responsible ministers, who hold office at his pleasure, but whose signature is necessary to validate his acts.

The legislative power is vested in a Senate of 52 members and a Chamber of Deputies of 116. The Senators, with the same age and residence qualifications as the President, are elected by departments, the number varying from one to four, according to the number of provinces in the department. The Deputies, Peruvians by birth and citizens of good standing, are elected in the proportion of one for every 30,000 inhabitants or majority fraction, though each province is entitled to one representative even if its population is less than 15,000. Senators must have an annual income of 1000 sols (£100), and Deputies of 500 sols (£50), or have a scientific profession. They are elected by direct vote for six years.

The judicial power is vested in a supreme court of justice, whose members are elected by Congress from names submitted by the President; superior courts in each department, whose members are appointed by the President; and judges of first instance in each province and local justices in each municipality, appointed by the judges of the superior courts. The conduct of all trials must be public. The executive and police powers of the Republic depend directly upon the President, who appoints the prefects of the various departments and the sub-prefects, who control the provinces. All police officials hold directly from the President. Citizenship is restricted by educational and property qualifications. The capital of the Republic is Lima.

Army and Navy. Service is universal and compulsory, three years being spent in the active or first-line army, 12 years in the two reserves, and 15 years in the militia, or a total of 30 years' liability. Total peace establishment: five battalions of infantry, seven squadrons of cavalry, six batteries of artillery, amounting to between 6000 and 6500 men in all. Arms: Infantry, Mauser rifle; cavalry, Mauser carbine. For purposes of military administration there are five territorial districts. In addition to the peace army there is a police force of approximately the same strength, viz., 2413 civil guards, 1900 mounted police, 1905 dismounted police.

History. Little is clearly ascertainable regarding the early history of the Peruvian Empire, and the lists given of its early sovereigns are by no means to be trusted. Almost all we know of their early history is derived from the traditions of the people, collected by the early Spaniards. (See PERUVIAN ARCHÆOLOGY.) In 1453 Tupac Inca Yupanqui, the eleventh Inca according to the list given by Laso de la Vega (q.v.), greatly enlarged his widespread dominions. He led his armies southward into Chile, marched over the terrible desert of Atacama, and, penetrating as far south as the river Maule, fixed there the southern boundary of Peru. While thus engaged, his son, the young Huayna Capac (q.v.), heir to the fame as well as the throne of his father, had marched northward to the Amazon, crossed that barrier, and conquered the Kingdom of Quito. In 1483 Huayna Capac ascended the throne, and under him the Empire of the Incas attained its greatest extent, his sway extending from the valley of the Amazon to Chile and from the shores of the Pacific to the sources of the Paraguay.

About the year 1516, and 10 years before the death of Huayna Capac, the first white man had landed on the west shores of South America, but it was not till the year 1531 that Pizarro (q.v.), at the head of a small band of Spanish adventurers, actually invaded Peru. Before his death the great Inca had expressed a wish that the Kingdom of Quito should pass to Atahualpa (q.v.), one of his sons by a princess of Quito, and that all his other territories should fall to his legitimate son, Huascar, the heir to the crown, and who, according to the custom of the Incas, should have inherited all its dependencies. Between these two princes quarrels resulting in war arose, and when Pizarro entered Peru he found the country occupied by two rival factions. Atahualpa had completely defeated the forces of his brother, had taken Huascar prisoner, and was now stationed at

Caxamarca, on the eastern side of the Andes, whither, with a force of 102 foot soldiers and 62 horsemen and two small falconets or cannon, the dauntless Spanish leader, in September, 1532, set out to meet him. A large ransom in gold was secured for Atahualpa, but instead of being released he was executed for his refusal to accept the Christian faith (August, 1533). Increased by reinforcements to about 500 men, of whom a third were cavalry, the Spaniards started for Cuzco. They entered the Peruvian capital, Nov. 15, 1533, having in the course of their progress towards the city of the Incas had many sharp encounters with the Indians, in all of which their armor, artillery, and cavalry gave them the advantage. At Cuzco they obtained a vast amount of gold, one of the objects for which the conquest of Peru was undertaken. As at Caxamarca, the articles of gold were for the most part melted down into ingots and divided among the band. After stripping the palaces and temples of their treasures Pizarro placed Manco, a son of the great Huayna Capac, on the throne of the Incas. Leaving a garrison in the capital, he then marched west to the seacoast, with the intention of building a town from which he could the more easily repel invasion from without and which should be the future capital of the Kingdom. Choosing the banks of the river Rimac, he founded, about 6 miles from its mouth, the Ciudad de los Reyes (city of the kings). Subsequently its name was changed to Lima, the modified form of the name of the river on which it was placed. The Inca Manco succeeded in effecting his escape and headed a formidable rising of the natives. Gathering around Cuzco in immense numbers, the natives laid siege to the city and set it on fire. The city was relieved by the failure of provisions among the besiegers and the departure of the Peruvians for their farms. The advantages—many, though unimportant—which the Inca gained in the course of this siege were his last triumphs. He afterward retired to the mountains, where he soon after perished. More formidable, however, to Pizarro than any rising of the natives was the quarrel between himself and Almagro (q.v.), a soldier of generous disposition but of fiery temper, who, after Pizarro, held the highest rank among the conquerors. Civil war ensued, in which Almagro was defeated and put to death. His followers, however, plotted revenge, and in 1541 Pizarro fell beneath their swords. The son of Almagro then proclaimed himself Governor, but was soon defeated in battle and put to death. In 1542 a council at Valladolid in Spain, called at the instigation of the ecclesiastic Las Casas, who deplored the cruelties committed on the natives, framed a code of laws, known as the "New Laws for the Indies," for Mexico and Peru, according to which the Indians who had been enslaved by the Spaniards were virtually declared free men. It was also enacted that the Indians were not to be forced to labor in unhealthful localities and that whenever they were desired to work in any particular locality they were to be fairly paid. Blasco Nuñez Vela, the first Viceroy of Peru, was sent from Spain to enforce the new laws. He rendered himself unpopular and was seized and sent back to Panama. The Audiencia, consisting of four judges, which had come with the Viceroy, now undertook the government. Gonzalo Pizarro (q.v.), who was already in re-

volt, now marched on Lima and was recognized as Governor by the Audiencia. Pizarro was overthrown by Pedro de la Gasca and put to death in 1548.

With the arrival of the Viceroy Antonio de Mendoza (1551) the rule of Spain was definitely established in Peru. For nearly two centuries after this date the destiny of the viceroyalty was presided over by the viceroys sent from Spain, who succeeded one another in most orderly fashion. Some of these administrators were very able, as Francisco de Toledo (1569-81), who issued many useful laws for the Kingdom; many were of average ability, while some were utterly incompetent. In all 41 Spanish viceroys held office in Peru. There were often conflicts between the civil and ecclesiastical officials or between the Viceroy and the Audiencia, and then charges and countercharges were made to the Council of Indies and the crown, but often years intervened before the matter was settled. The University of San Marcos in Lima, the oldest of the New World, was founded in 1551, and in 1569 the Inquisition was established to carry on its work of extirpating heresy. The Dominicans, Franciscans, Augustines, Mercedarios, and Jesuits established convents in Peru, labored for the conversion of the Indians, conducted the education of the people, and wrote regarding the life and languages of the natives. The Jesuits were expelled in 1767. The question of the treatment of the Indians was perennial. Many laws and orders were issued for their protection, but the rapacity and cruelty of lesser officials, so far from the central government, could not always be controlled, and consequently the natives suffered many hardships. Finally, in 1780, the tranquillity of the province was broken by an Indian revolt led by Tupac Amaru, a descendant of the Incas, who promised his people relief from the oppressive *mita* and other abuses of the Spaniards and endeavored to reestablish the throne of his ancestors. Successful at first, the revolt was crushed, and Tupac Amaru and the members of his family were condemned and executed in a most brutal manner. During most of the colonial period the jurisdiction of the Viceroyalty of Peru extended over the whole of Spanish South America. In 1718 the Viceroyalty of New Granada was formed (later suppressed and reestablished in 1739) of the region now occupied by Venezuela, Colombia, and Ecuador, and in 1776 most of the present Argentina, Bolivia, Paraguay, and Uruguay was detached, and made into the Viceroyalty of Río de la Plata. Spain contributed much to Peru—civilized jurisprudence, religion, domestic animals, and many grains and fruits. On the other hand, Europe received from Peru the potato, maize, and quinine. During the Spanish régime the country enjoyed much prosperity; mining and agriculture were especially developed. The viceroys were enabled to remit many thousands of dollars to Spain for the support of the crown.

Peru took no part in the earlier movement for independence in Spanish America. In July, 1816, when the Viceroy José Fernando Abascal turned over his office to his successor, Joaquín de la Pezuela, there was a Spanish army of 23,000 men in Peru and all resistance had apparently been stamped out in Chile, Upper Peru (Bolivia), Quito, and New Granada, Buenos Aires alone maintaining her independ-

ence. Peru was the last of the Spanish South American possessions to set up the standard of independence. In August, 1820, an army under General San Martín (q.v.), one of the liberators of Chile, landed at Lima, and after a number of successes both on sea and land, in which the patriots were effectively assisted by Lord Cochrane, General Miller, and other English volunteers, the independence of the country was proclaimed at Lima, July 28, 1821. San Martín assumed the protectorate of the young Republic. By the spring of 1822 he had forced the surrender of the last large body of Spanish troops. At this juncture General Bolívar (q.v.), flushed with his successes in the north, landed at Guayaquil. San Martín, recognizing the dangers of rivalry, arranged a meeting on July 26, 1822, the details of which were never made public, but as a result of which San Martín resigned and, a year later, retired to England. A Congress was summoned, and on Feb. 28, 1823, José de la Riva Agüero was installed as the first President of Peru. Meanwhile the scattered bands of Spanish Royalists had managed to collect in the south, around Cuzco, and the agents of Bolívar succeeded in persuading the Congress to depose Riva Agüero. On Sept. 1, 1823, Bolívar landed at Callao and devoted himself to organizing an army. On Feb. 10, 1824, he was appointed Supreme Dictator by the Congress. For a while the Royalists under Canterac made considerable headway, occupying Callao Castle and forcing Bolívar to evacuate Lima. The two armies met on the plains of Junín, where a remarkable battle was fought in which the Peruvian cavalry turned defeat into victory by repeated charges with their lances. The Spaniards retired to Cuzco, where the Viceroy, La Serna, concentrated his forces for a final stand. On December 9 a battle was fought at Ayacucho in which the patriots, under General Sucre, were completely successful, and the Spanish officials and generals, with over 3000 soldiers, surrendered. The guerrilla fighting continued for a while in the north, where General Olafeta stubbornly held out until shot by his own troops in April, 1825. In 1826 the Spaniards evacuated Callao, and the war was at an end. Bolívar, on Feb. 10, 1825, resigned the dictatorship, but was immediately reappointed and remained in control of the government until March, 1827, when he returned to Colombia with his soldiers. On June 4, 1827, a congress met and framed a provisional constitution, adopted in 1828. General Lamar was elected president. Lamar promptly forced a quarrel with Bolívar, who declared war and defeated him, enforcing a money indemnity and the surrender of Guayaquil. The history of the next 35 years is the record of repeated changes in government, one man after another gaining a personal ascendancy, lasting a few days or years, until some rival took advantage of his mistakes to supplant him. Withal, the state of the country gradually improved, commercially, socially, and intellectually, but with few events of especial interest or importance.

In April, 1864, a Spanish squadron seized the Chincha Islands in reparation for injuries sustained by Spanish subjects. President Pezet was unwilling to risk a war with Spain, and a treaty of peace was signed in January, 1865. The action of the President aroused bitter opposition in the country; he was declared a traitor by the Assembly, and in February a revolution

broke out which ended in the overthrow of Pezet and the proclamation of Mariano Ignacio Prado as Dictator (Nov. 26, 1865). An alliance against Spain was concluded with Chile, Ecuador, and Bolivia, war being declared in January, 1866. On May 2, 1866, a Spanish fleet bombarded Callao, but was compelled to withdraw. This marked the termination of hostilities. In 1879 Peru as the ally of Bolivia became involved in war with Chile. (See BOLIVIA; CHILE.) In October, 1879, the Peruvian man-of-war *Huascar* was captured by the Chilean fleet, and on November 19 the forces of Bolivia and Peru were overwhelmed at Dolores. A Chilean army under General Baquedano captured Moquegua and Tacna, two important cities in south Peru, in March and May, 1880. Early in June the same general carried the almost impregnable stronghold of Arica by storm, thus gaining possession of the whole of south Peru. In the meantime the Chilean fleet was blockading or pillaging the North Peruvian seaports. The Peruvians refusing to accede to the terms for peace dictated by Chile, Baquedano organized an expedition against Lima. This expedition started in November, by water, and landed at Pisco and Curayaco, about 200 miles south of Lima. With an army 30,000 strong, the Chilean general marched on the capital, spreading devastation along the way. The Peruvians were defeated at Chorrillos on Jan. 13, 1881, and at Miraflores on January 15, and on January 17 the Chileans made their entry into Lima. Capt. Patrick Lynch, the leader in a raid which had devastated the northern coast towns, was appointed Chilean commandant of the town. After the fall of Lima desultory fighting continued until a treaty of peace was concluded at Ancón, Oct. 20, 1883. Peru ceded to Chile the District of Tarapacá and the territories of Tacna and Arica for a term of 10 years; the people of these territories to decide by popular vote whether they wished to return to Peru or to remain under Chilean rule. At the close of the 10 years Chile apparently distrusted the result of the plebiscite, and the matter was allowed to drag on. The question has not yet been settled, and is still a source of irritation in the relations of the two countries, although Peru has made numerous efforts to secure an adjustment.

The war left Peru in an exhausted and bankrupt condition, from which the process of recovery was slow. Civil war added to the difficulties, but in 1884-85 a successful revolt occurred which placed Gen. Andrés Cáceres (1886-90) in the presidency. The foreign debt weighed heavily on the country, but in 1890 a scheme for the cancellation of the debt was worked out. By the agreement the foreign bondholders took over the national railways, with certain guano rights, mining privileges, and land grants, while Peru was relieved of her indebtedness. The Peruvian Corporation was formed in London to carry out this contract. At the close of the administration of Col. Morales Bermúdez (1890-94) a civil struggle took place between General Cáceres and Nicolás de Pierola, in which the latter was successful and was elected President for the term 1895-99. Presidents Eduardo de Romaña (1899-1903), Manuel Candamo (1903-04, who died in office), José Pardo (1904-08), and Augusto Leguía (1908-12) quietly assumed and laid down the office. Minor revolts occurred in 1899 and 1909, but they were quickly suppressed.

Each of these executives labored to improve the conditions of the country, and notable progress was achieved in many directions. In 1906 President Pardo revoked the decrees which allowed the improper exploitation of the natural resources. With respect to foreign relations the principal problem has been that of the boundaries, some of which have been adjusted, while others are still pending. The revelations regarding the Putumayo atrocities, which occurred in the Peruvian Amazon region, stirred the world in 1912, and the United States and England urged upon Peru that she take measures to remedy the abuses.

In 1912 Guillermo Billinghurst became President. His friendly attitude towards Chile, his endeavor to weed out corrupt political practices, and his disregard of certain political elements brought on a revolt (Feb. 4, 1914), which resulted in his overthrow and exile. Col. Oscar Benevides assumed the provisional presidency and undertook to continue constitutional government. This political change had little effect upon the economic prosperity, but the outbreak of the European War produced serious disturbances. The government resorted to the issue of paper money, which caused further unsettled financial conditions. In 1915 Dr. José Pardo was elected President.

PERU. A city in Lasalle Co., Ill., 61 miles north-northeast of Peoria, at the head of navigation on the Illinois River, on the Illinois and Michigan Canal, and on the Chicago, Rock Island, and Pacific, the Chicago, Ottawa, and Peoria, and the Chicago, Burlington, and Quincy railroads (Map: Illinois, F 3). It has a public square and public parks and is the seat of St. Bede College (Roman Catholic), opened in 1891. Among the prominent buildings are Turner Hall, the Masonic Temple, the Carnegie library, People's Hospital, and the German library. There are four bridges here, including a fine railroad bridge. Peru is the centre of valuable bituminous coal fields and of extensive deposits of cement rock and white sand rock. Its industrial establishments include large zinc-rolling mills and furnaces, a foundry and machine shop, scale works, plow and wheel works, clock works, breweries, nickeloid works, a planing mill, a metal weather-strip factory, and novelty works. The government is administered under a charter of 1890, by a mayor, elected every two years, and a council. The water works and the electric-light plant are owned and operated by the municipality. Peru was first settled in 1827 and laid out in 1834. In 1851 it was chartered as a city. For the archaeologist the vicinity presents much interest, as there are relics of the Mound Builders. Pop., 1900, 6863; 1910, 7984.

PERU. A city and the county seat of Miami Co., Ind., 74 miles north of Indianapolis, on the Wabash River and on the Wabash, the Lake Erie and Western, and the Chesapeake and Ohio of Indiana railroads (Map: Indiana, E 3). The city has a public library, a city hospital, and two sanatoria. It derives considerable trade from the tributary country, which is largely agricultural. There are railroad shops of three systems, brass and steel foundries, bagging mills, carbon works, and manufactories of automobiles, gas engines, furniture, pianos, cabinets, refrigerators, wagons, etc. Peru, incorporated in 1848, is now governed under a charter of 1868 which provides for a mayor, elected biennially, and a council. There are municipal water works and a municipal electric-light plant. Pop., 1900, 8463; 1910, 10,910; 1915 (U. S. est.), 12,280.

PERU BALSAM. See BALSAM.

PERUGIA, pà-rŭ-jà. The capital of the Province of Perugia, Italy, situated on picturesque hills between the Tiber and Lago Trasimeno, at an altitude of 1617 feet above the sea, 103 miles by rail southeast of Florence (Map: Italy, D 3). Its situation is beautiful, offering delightful views of the Umbrian and Foligno valleys and of the Tiber and the Apennines. The town is inclosed by walls, and its mediæval appearance is attractive and interesting. It has many striking edifices dating from its glorious days at the beginning of the Renaissance period, and numerous art treasures, but is not so much frequented as Orvieto and Siena, with their famous cathedrals.

Perugia is irregularly laid out. Many of its substructures belong to the ancient Etruscan town. It possesses ample squares and pleasant grounds. The Gothic cathedral of San Lorenzo is not very striking, although of the Renaissance period. The most valuable of its varied contents is Signorelli's "Madonna with John the Baptist." Its library possesses ancient and costly manuscripts. The Oratorio di San Bernardino has a sculptured, multicolored early Renaissance façade (1457-61). The San Domenico (1304) is a fine Gothic church which has been attributed to Giovanni Pisano; it was rebuilt in 1614 and contains the elaborate and celebrated monument to Benedict XI. The Basilica San Pietro de' Cassinensi in the vicinity was founded about 1000 on the site of a sixth-century building; it contains noteworthy pictures by Perugino, Caravaggio, and others and has rich choir stalls (1535) in walnut. The notable old secular edifices of Perugia include the fine Cambio (the old exchange), with its celebrated mural paintings of the Chief Virtues by Perugino—his finest fresco—and other artistic features, all in the best Renaissance. The immense Palazzo del Municipio (dating from 1281, but not completed till 1443) is in Italian Gothic, with two façades. It has been latterly restored and is elaborately embellished with ancient sculptures, etc. Under its roof are the Vannucci picture gallery (municipal), a valuable collection of ancient Umbrian works taken from suppressed religious institutions, some of the churches, etc., and the public library, with over 70,000 volumes and some rare mediæval manuscripts. The finest section of the picture gallery is the Sala del Pinturicchio, with examples by Perugino and Pinturicchio. The college of San Severo is a notable ancient building, formerly a cloister. Here Raphael, who had been a pupil of Perugino, painted his first fresco in 1505. It is now in a spoiled condition. Among the attractive modern buildings are the arcaded Perfettura. In the centre of the modern city is a fine bronze equestrian statue of Victor Emmanuel II. Perugia has also a bronze statue of Julius III, a monument to Garibaldi, and a monument to the soldiers who fell for freedom in 1859. There are, besides, the beautiful Maggiore fountain (1277-80), bearing reliefs by Niccola and Giovanni Pisano; the striking Roman Arch of Augustus, constructed in the third century, and still one of the gateways of the city; and the house where Perugino dwelt.

The famous "free" University of Perugia, founded in 1320 and now much less important than formerly, has two faculties, law and medicine, the latter including pharmacy and veterinary science. In 1912 the students numbered only 278. Its library possesses 54,000 volumes.

In addition there may be mentioned an art-history collection and a botanical garden, and the valuable university collection of Etruscan, Roman, and mediæval antiquities. There are in the city a lyceum, a Gymnasium, a technical school, a technical institute, a seminary, an academy of fine arts, and an agricultural institution. A large orphan asylum is the chief charitable institution. There are manufactures of silk goods, velvet, and spirits. In the commerce figure chiefly grain, wine, and oil. Three miles southeast of the city lies the Etruscan necropolis of Perugia, discovered in 1840, with remarkable tombs including the sepulchre of the Volumnii. Pop. (commune), 1901, 61,385 (town, 20,580); 1906, 65,527 (22,321); 1911, 65,805.

Perugia (anciently called *Perusia*) was one of the 12 important Etruscan League cities. It became Roman in 309 B.C. In 41-40 B.C. it was unsuccessfully held by the partisans of Lucius Antonius against Octavianus (Augustus). It was destroyed by Octavianus and then rebuilt by him. It was again destroyed by Totila the Goth after a siege of seven years, about the middle of the sixth century. In the ninth century it fell under the dominion of the popes, but it afterward enjoyed a long period of independence and at the close of the Middle Ages ruled Umbria. About the middle of the sixteenth century it was incorporated in the Papal States. It passed to the Sardinians in 1860 and became a part of the new Kingdom of Italy. Consult: G. B. Vermiglioli, *De monumenti di Perugia etrusca e romana* (3 vols., Perugia, 1855-70); J. W. and A. M. Blashfield, *Italian Cities* (ib., 1912); Symonds and Duff-Gordon, *The Story of Perugia*, in "Medieval Towns Series" (London, 1912), containing a bibliography.

PERUGIA, LAKE OF. A lake in Italy. See TRASIMENO, LAKE.

PERUGINO, pà-rŭ-jè-nò, PIETRO, properly PIETRO VANNUCCI (1446-1523). An Italian painter, chief master of Umbria during the earlier Renaissance. Born at Città della Pieve, a mountain town near Chiusi, Perugino was the natural heir of the traditions of the Umbrian school, the leading note of which was the atmosphere of sentiment and mystic poetry, which found its best expression in the portrayal of the ideals of devotional art. His early paintings indicate Fiorenzo di Lorenzo as his master, although Buonfigli and Niccolò da Foligno have likewise been credited with his tutelage. According to Vasari, Perugino completed his studies under Verrocchio at Florence, which seems likely, in view of the influence of Verrocchio on his work. Though already independent in style, his early pictures reveal the influence of these and other contemporaries, in such works as the "St. Sebastian" (a fresco at Cerqueto), the "Crucifixion" (Uffizi and St. Petersburg), and the "Pieta" (Academy, Florence). His middle period, that of his most ambitious works, begins about 1481 with his frescoes in the Sistine Chapel, Rome, where he painted in rivalry with Botticelli (q.v.) and other great contemporaries of Florence and Umbria. Of Perugino's frescoes, three were afterward destroyed to make way for Michelangelo's "Last Judgment"; but a fourth, the "Delivery of the Keys to St. Peter," is, from a decorative point of view, the best of the entire series. Among other remarkable works of

his middle period are the "Entombment" (1495), Pitti Palace; the "Crucifixion" (1493-96); a fine fresco in Santa Maddalena dei Pazzi, Florence, and the "Madonna with Two Archangels," National Gallery, London.

His last period (c.1496-1524) was of great production but of declining artistic merit. Perugia, to which he returned definitely in 1506, was largely the centre of his activities. He made much use of his pupils in the execution and repetition of his pictures. His most extensive decoration comprised the frescoes of the Cambio (Merchant's Exchange) in Perugia (1500-04), in which allegories are depicted as female figures, along with antique heroes, lawgivers, prophets, and with sacred subjects—charming in color and neat in execution, but hardly atoning for lack of vigor by a superabundance of sentimentality. Although his latest works, like the "Triumph of Chastity" (Louvre), painted for Isabella d'Este's celebrated chamber in Mantua (see MANTEGNA, ANDREA), show decline, there are notable exceptions, like the frescoes of the Collegiata, Spello. Among the best of his altarpieces not mentioned in the above lists are the "Virgin Enthroned" (1496), in the Vatican; the "Annunciation" (1487), Fano; "Crucifixion," "Gethsemane," and "Assumption" (1500), all from Vallombrosa, but now in the Florence Academy; "The Vision of St. Bernard" at Munich; a triptych in Villa Albani, Rome; "Apollo and Marsyas" (attributed to Raphael) and three others in the Louvre. The celebrated "Marriage of the Virgin," at Caen, is now generally considered a work of Lo Spagna (q.v.). The collections and churches are especially rich in his works. His ability in portraiture is shown by the heads of two monks of Vallombrosa in the Academy, Florence, the beautiful portrait of a lady and that of Francesco dell'Opera in the Uffizi, and the fresco portrait of himself in the Cambio, Perugia.

The mediæval ideal of the Umbrian school finds in Perugino's works its most complete expression. He created the ideal type of the Madonna, pietistic yet of classic refinement, which found its consummation in Raphael. The deep religious sentiment of his figures is expressed not only in the figures themselves but in the landscape background, which reveals a consummate mastery of space composition. His color is rich and mellow, often suffused with a summery golden tone; but notwithstanding his Florentine training his work is usually deficient in form and movement. Despite the piety of his pictures he was reputed an atheist and immoral—with what truth it is impossible now to say. He died of the plague at Castello di Fontignano.

PERUVIAN ANTIQUITIES. See **PERUVIAN ARCHEOLOGY.**

PERUVIAN ARCHEOLOGY. At the

time of the Conquest the Empire of the Incas comprised the present countries of Ecuador, Peru, Bolivia, and that part of Chile north of the Maule River. Long before the time of the Incas the country had seen at least one powerful Empire arise and attain great skill in the arts. The stupendous and elaborate remains at Tiahuanaco are the most familiar example of the work of these ancient people. As other evidences of the great antiquity of man in this region may be cited the sun circle of Sillustani and structures that are almost the counterparts of Stonehenge and Carnac, to which is assigned the remotest place in monumental history.

Of the peoples who immediately preceded the Incas in this region but little is definitely known, being mostly derived from such works as they have left behind them.

In Ecuador there seem to have been several centres of culture—one by the people inhabiting the Province of Imbabura. In the region about Quito were the Caras, near Riobamba the Puruhas, about Cuenca and Cañar the Cañaris, and still others in Manabí and Esmeraldas.

Among the many peoples or tribes of Peru and Bolivia the most important were the Quichua (Kechua), the Aymara, and the Yunca. The last was a general name for the peoples of the coast valleys. Sir Clements R. Markham, an eminent authority, says: "The dawn of history found Peru broken up into many independent *ayllus*, or tribes composed of families of the same lineage. The Incas, Quichuas, Allcovichas inhabited the valleys around Cuzco. Collas, Lupacas, and Urus occupied the basin of Lake Titicaca. The powerful nation of Chancas dominated in the valleys from the Apurimac to Cerro Pasco, with the subordinate Pocras, Huancas, Soras, and Lucanas, and the Chinchas on the coast." Northern Chile was inhabited by a people of Araucanian affinities.

The Incas were originally a warlike tribe living in the great central plateau of the Andes. They had domesticated the llama, which they used as a beast of burden, and could thus transport arms and supplies to considerable distances—which was a great advantage to them in their wars. One region after another, either voluntarily or by conquest, came under their sway, until the Inca Empire extended along the Pacific from about the second degree north to the thirty-seventh degree of south latitude.

The social structure of Peru was not unlike that of the more primitive tribes to the north. There was a head chief, or Inca, who had an advisory council elected by the various clans or gentes of the people. The office of Inca was hereditary in the female line.

The religion was based upon the worship of the sun as the supreme god, who according to the Incas had three sons: Kon or Viracocha, Pachacamac, and Manco Ccapac, the last the founder of the Incan Empire. It is, however, probable that the myths of Viracocha and Pachacamac antedate the Incas. Legend says that Viracocha (q.v.) signifies "foam of the lake or sea." One day he arose out of the waters of Lake Titicaca and created the sun, moon, and stars. He made stone statues and, putting life into them, commanded them to follow him to Cuzco. After setting Allca Vica, the ancestor of the Incas, over them he disappeared in the water.

Pachacamac signifies "He who animates the universe." He was regarded as the being who

created and ruled the world. In the valley of Rimac a vast temple was erected to this invisible god.

Next to the sun the Incas worshiped the moon, his sister and consort. Cuycha, the rainbow, was venerated as the servant of the sun and moon; Chasca, the planet Venus, as the page of the sun. The Pleiades were the next most venerated. Fire was worshiped as coming from the sun, and thunder as his servant. After these were many minor deities and canopas, which last correspond to the lares and penates of the Romans. The bloody rites so frequent in Mexico and Yucatan were unknown in Peru.

The Peruvians believed in the existence of the soul after death and also in the resurrection of the body. The good were to live a life of luxury and ease; the wicked must expiate their crimes by ages of wearisome labor.

The Empire of the Incas was a perfect theocracy. The reigning Inca was not merely the representative of divinity; he was divinity itself, the law, and the lawgiver, the violation of whose ordinance was sacrilege. The Inca appointed the chief priest, who in turn nominated all his subordinates. All the higher offices were filled by members of the Inca family. The virgins of the sun were young maidens dedicated to the service of the deity. They dwelt in convents under the charge of elderly matrons. These holy virgins were occupied in weaving the fine wool of the vicuña into garments for the Inca and hangings for the temples. In the houses of the virgins of the sun at Cuzco all the inmates, said to number 1500, were of royal blood. These virgins of the sun were brides of the Inca, and at marriageable age the most beautiful were transferred to the royal seraglio. The great nobles were also allowed a plurality of wives. At an appointed day of each year all those of marriageable age were called together in the great squares throughout the Empire. The marriage ceremony consisted in joining the hands of the couples to be united. The Inca performed this ceremony for his own kindred, pronouncing them man and wife. His curacas performed a like office for the nuptials of those of inferior rank. Land was allotted to the newly wedded pair for their maintenance, and a dwelling was built at the charge of the district.

The land was parceled out to the various clans, by whom it was owned in common, and under the wise system of administration every one not incapacitated by age or other infirmity was obliged to be a producer. Agriculture was the basis of prosperity and was carried on carefully and thoroughly, with division of labor, irrigation, manuring, and terracing of rocky slopes, to make every tillable acre yield its full return. Their chief crops were maize, potatoes, yucca, quinoa, coca, and cotton. Much attention was given to irrigation, aqueducts and canals crossing the low lands in all directions like a vast network. A good example of their irrigating works is the aqueduct at Chimbote, a barren and desolate region in northern Peru. The greater part of this fine work still exists and is computed to have a capacity of supplying 60,000,000 cubic feet of water daily. Dogs were kept as elsewhere, besides monkeys, birds, and guinea pigs, and the llama had been domesticated as a beast of burden and for its hair, from which, as well as from native cotton, were spun and woven the fabrics in common use.

Peruvian architectural structures composed of stone were characterized by simplicity, symmetry, and solidity. These stones, often huge bowlders, were put together without mortar, but so exactly cut and fitted to each other that the blade of a penknife could not be forced between them. The Peruvians excelled as road builders. Remains of many of these roads exist; the most important one is said to have extended from Quito to Cuzco.

In the manufacture of textile fabrics the Peruvians stand unrivaled among ancient peoples, being acquainted with every style of weaving known to-day. Some of their tapestry, in the excellence and finish of the weaving and beauty of the colors and designs, has probably never been excelled. They showed a degree of skill in other mechanical arts similar to that displayed in their manufacture of cloth. They have left behind them many remarkable evidences of their knowledge in working metals. They were familiar with the processes of smelting, casting in molds, hammering, and soldering. Tools and various objects of copper and bronze were in use. In the ancient tombs have been found many elegant and curious objects of gold and silver, vases, cups, bracelets, collars, and personal ornaments. Emeralds they possessed in considerable quantity, and these they cut with great skill. In the manufacture of pottery they attained a high degree of excellence. Many of these vessels are beautiful in outline. Often they represent the human form or that of some familiar object or animal, and in the firing and decoration they show an advanced stage in the potter's art.

In music they had reached considerable proficiency, judging by the number and variety of the musical instruments left behind them. Among these are Panpipes, flutes of cane and bone, clay trumpets, trumpets of shell, bells of bronze and copper, and a great variety of whistles, capable of yielding a scale of several tones. It does not appear that they ever reached the more advanced stage of stringed instruments. Of the character of their vocal music we know nothing.

They had considerable knowledge of medicine and surgery, employing bleeding and purging. They had knowledge of the healing properties of plants and successfully performed the difficult operation of trepanning. In astronomy they had made some progress, dividing the year into 12 lunar months. They also had weeks, but of how many days is uncertain. As their lunar year would necessarily fall short of the true time, they corrected their calendar by solar observations made by means of columns raised on the high lands at Cuzco. These served them for taking azimuths, and by measuring their shadows they ascertained the exact times of the solstices. The period of the equinoxes was determined by the help of a solitary pillar.

The ancient Peruvians, having no written language, made use of the quipu in keeping their accounts. It is a device consisting of a main cord with others of different colors depending from it like a fringe. Each color denoted some object. *Quipu* signifies a "knot." Knots tied in the depending cords served as ciphers, and by tying them at different distances from the main cord they could be made to represent numbers to any amount required. There was also a considerable body of legend and drama handed down by oral tradition. Among these the drama of *Ollanta*, committed to writing soon after

the Conquest, has been translated into several languages.

The burial customs varied in different parts of the country. Believing in the resurrection of the body, the Peruvians everywhere exercised care to preserve it. The mummies, or, more strictly speaking, the desiccated bodies of the dead, owe their preservation to the exceedingly dry and rarefied atmosphere of the mountains or the dry nitrous sand of the coast regions. In preparing the body for the grave it was commonly placed in a sitting posture, with the knees drawn up and the chin and hands resting upon them. In the extreme northwestern part of Peru the body was buried in an extended position. The mummies of the better class were often covered with wrappings of fine cotton cloth; over this were ponchos and blankets made of the wool of the alpaca and vicuña. With them were placed vases of elegant design and often objects of gold and silver. The ceremonies of the poor are scanty and mean and the objects buried with them of inferior quality. Food was always placed with the dead and generally the objects most prized in life. The last resting place varied with the locality. In some places vast mounds penetrated by galleries were raised over the dead. In others mummies are found in little vaults or chambers of adobe, roofed with sticks or canes, often containing four or five bodies. In Callao and parts of Bolivia the burials were in stone chulpas or burial towers.

Scattered over the country are extensive ruins of ancient temples, convents, palaces, and burial places, many of which undoubtedly long antedate the Incan Empire.

The ruins of the so-called temple, convent, and palace at Tiahuanaco, near the southern extremity of Lake Titicaca in Bolivia, are good examples of pre-Incan remains. Although but few stones of the structures are in position, enough remain to show their character and size. In these buildings copper clamps were used to hold the stones in position. The temple was rectangular in form, 445 by 388 feet. Here also is the famous monolithic doorway. The stone is 13 feet, 5 inches long, 7 feet, 2 inches high, and 18 inches thick. Through this is cut the doorway, 4 feet, 6 inches high and 2 feet, 9 inches wide. Scattered about the ruins are blocks of sandstone, trachyte, and basalt, many of them symmetrically cut and elegantly decorated. When Tiahuanaco was first visited by Europeans, these structures had been in ruins for such a length of time that even native traditions were silent as to their builders.

At Pachacamac (q.v.) the Incas erected a magnificent Temple of the Sun, a House of the Virgins of the Sun, and a temple to Pachacamac. The temple was rifled of a vast amount of gold and silver by the Spaniards.

On the islands of Titicaca and Coati, in Lake Titicaca, are a number of famous ruins. The island of Titicaca was dedicated to the sun and was the sacred island of Peru. Its most notable ruins are those of the Palace of the Incas, the Storehouse of the Sun, and the Bath or Fountain of the Incas. The Temple, a stone building 51 by 44 feet and two stories high, is in a fair state of preservation. The walls were covered inside and out with stucco and painted, as may be seen by patches still remaining on the stones. The large stone edifice called the Storehouse by the early chroniclers gained its

title from the darkness of its small rooms and connecting passages, which precluded the idea that it had been used as a habitation. The Bath or Fountain has suffered but little from time. It is a pool 40 by 100 feet and 5 feet deep, paved with worked stones and fed by four streams of water from openings cut in the stone.

On the island of Coati (dedicated to the moon) are two groups of ruins. The principal of these, the Palace of the Virgins of the Sun, is in a fair state of preservation. It is rectangular in form, 183 feet long by 80 broad. The structure, built of roughly cut stones, was two stories high. The first story is divided into 35 apartments of various sizes. The floors of the upper rooms, which were probably of wood, have disappeared. The second group consists of stone buildings with narrow passages between them. These and similar buildings on Titicaca are believed to have been used for ceremonies through which pilgrims were obliged to pass before visiting the sacred shrines.

At Cuzco the Temple of the Sun was said to have been the most imposing edifice in all Peru. Existing remains confirm the accounts of the early chroniclers. Surrounding the temple were other buildings, dedicated to the moon, Venus, the Pleiades, the thunder and lightning, and the rainbow.

Among the other notable ruins of Peru may be mentioned those of the ancient city of Chimú, consisting of a labyrinth of ruined walls, dwellings, and other structures, and gigantic huacas or burial places; Sillustani, with its chulpas or stone burial towers and sun circle; the great fortress in the valley of Cañete, near Lima, those of Hervai in the valley of Huarco (also near Lima), including a temple said to have been dedicated to the oracle deity, Rimac; the rock tombs of Ollantaytambo, these tombs being excavations, natural or artificial, in the face of a high cliff, within which the dead were placed and walled up with stones, stuccoed over and painted. Here also are the ancient porphyry quarries and the remains of numerous Inca walls and structures.

PERUVIAN BARK. See CINCCHONA.

PERUZZI, pà-rùt'se, BALDASSARE (1481-1536). An Italian architect and painter, the most gifted artist of the High Renaissance. He was born at Volterra, near Siena, March 7, 1481. Little is known of his early career, but from his work it is probable that he followed Il Sodoma and Pinturicchio in painting. In 1504 he went to Rome and speedily distinguished himself in frescoes in Sant' Onofrio, in the Vatican (ceiling of the Camera del Eliodoro), and Santa Maria della Pace. Aided by Agostino Chigi, Peruzzi studied the treasures of Rome, especially its architecture, and, encouraged by Bramante, then in charge of the construction of St. Peter's, became skilled in the elements of architectural design and composition. It is notable that in his detail especially he reflects the grace and sentiment of Umbria in his choice of profiles and ornament *motifs*, exhibiting in all his work great delicacy of proportion and a pleasing individuality. In 1516 he designed for Agostino Chigi the Villa Farnesina, which was destined to become famous through the frescoes of Raphael and his school. The admirable frescoes on the ceiling of the room containing Raphael's Galatea are after his designs. Appointed architect of St. Peter's by Leo X in 1520, he made numerous studies to correct the defects of Bramante's original design, but none of these was executed. In 1525 he designed the Ossoli Palace, which shows an evident advance in the principles of planning. At the sack of Rome in 1527 Peruzzi was forced to paint a portrait of Bourbon, but upon its completion escaped to Siena, where he was made the city architect and superintended the construction of the Sienese fortifications, besides designing the Palazzo Polini and other works. At this time he executed a number of frescoes and panel paintings, among which was the well-known "Augustus and the Sibyl" in the church of Fontegiuista (Siena). His paintings are decorative in character, even to the sacrifice of truth to nature; they show the influence of Raphael and Michelangelo, and are apt to be mannered.

In 1532 he returned to Rome and commenced the building of the Massimi Palace, his architectural masterpiece, both in its general proportions and the variety of the detail and ornament. He carried on this work until his death in 1536, caused, according to tradition, by poison given by those envious of his position as architect of St. Peter's.

Consult: Letarouilly, *Edifices de Rome moderne* (6 vols., Paris, 1840-57); Donati, *Elogio di Baldassare Peruzzi* (Siena, 1879); Arthur Weese, *Baldassare Peruzzi's Anteil an dem malerischen Schmucke der Villa Farnesina* (Leipzig, 1894); W. J. Anderson, *Architecture of the Renaissance in Italy* (4th ed., New York, 1909).

PERUZZI, UBALDINO (1822-91). An Italian statesman, born in Florence. After pursuing the study of law at Siena he went to Paris and Freiberg, where he devoted himself to the study of mathematics and mining. In 1848 he was appointed gonfaloniere (chief magistrate) of Florence, but was removed in 1850 on account of his outspoken opposition to the reactionary policy of the Tuscan government. He remained a warm advocate of liberal ideas and after the revolution of April, 1859, became a member of the provisional government. After the annexation of Tuscany to the dominions of Victor Emmanuel he was elected from Florence to the

new Italian Parliament (1860). In 1861 he was Minister of Public Works under Cavour, and he continued in office under Ricasoli. Afterward he held the post of Minister of the Interior in the Farini and Minghetti cabinets. With Minghetti he went out of office in 1864, and thereafter acted as one of the Liberal leaders in Parliament.

PERVIGILIUM VENERIS (Lat., Night Watch of Venus). An anonymous poem of 93 lines, dating from the second or third century A.D., celebrating the power of Venus and referring to a nocturnal festival in her honor. It has been edited by Bücheler (Leipzig, 1859).

PESADO, pè-sà-dò, JOSÉ JOAQUÍN (1801-61). A Mexican poet and politician, born at San Agustín del Palmar. He was chiefly self-educated while living in Orizaba as a young man, became proficient in languages, science, and philosophy, entered politics in 1833 as member of the Vera Cruz Legislature, and five years afterward was made Minister of the Interior. In 1854 he gave up his post as Foreign Minister, which he had held for eight years, to become professor of belles-lettres in the University of Mexico. He became joint editor of the paper *La Oposición* in 1834, and wrote a novelette directed against the Inquisition, though religious subjects and Catholic sentiment prevail in his poems. Besides a collection of them, *Poesías originales y traducidas* (1839; 3d ed., 1886), he published a fragment, *La revelación* (1856), and a Spanish version of part of Tasso's *Gerusalemme liberata* (1860). Consult: José M. Roa Bárcena, *Biografía, etc.* (Madrid, 1878); Francisco Pimentel, *Historia crítica de la literatura y de las ciencias en México: Poetas* (Mexico, 1885); *Antología de poetas hispano-americanos*, vol. i, edited by Marcelino Menéndez y Pelayo (Madrid, 1893).

PESARO, pà-zà-rò. The capital of the Province of Pesaro e Urbino, Italy, situated at the mouth of the Foglia, on the Adriatic and on the Bologna-Ancona Railroad, 20 miles northeast of Urbino (Map: Italy, D 3). It has broad streets and is partly surrounded by walls, with five ancient gates extant. Its fifteenth-century castle is now used as a powder magazine. There are the old cathedral of San Francesco and the new cathedral of Santa Maria Assunta, several palaces, including that of the dukes of Urbino, a public library of 50,000 volumes, a museum with collections of paintings and antiquities, a technical institute, an episcopal seminary, an agricultural school, a collection of majolica ware, a musical lyceum, founded by Rossini, who was born here. A bridge over the Foglia dates from the time of Trajan. The industries are silk spinning, shipbuilding, and manufactures of ironware, earthenware, machinery, and oil. There is a brisk shipping trade in figs, wine, oil, hides, silk, iron, lead, grain, and cheese. Pop. (commune), 1901, 25,103; 1911, 27,348. Pesaro, the Pisaurum of the Romans, was founded 184 B.C. It was destroyed by the Goths and restored by Belisarius and later formed a part of the Pentapolis. Pepin presented it to the papacy. At the end of the thirteenth century it came under the rule of the Malatesta family, who sold it to the Sforza family in 1445. It was subsequently ruled by the Rovere dynasty of Urbino. In 1631 it reverted to the states of the Church, and since 1860 has formed a part of united Italy.

PESCADORES, pès-kà-dò-ràs. A group of small basaltic islands (called by the Japanese

Hōko-tō or **Hōko-guntō**) situated off the west coast of the Japanese island of Formosa and on the tropic of Cancer (Map: Japan, C 8). They cover an area of about 85 square miles and are mostly flat and barren. The largest of the group, Hokoto, has a good harbor. The inhabitants are engaged principally in fishing, and dried fish is the only export. Pop., 1898, 49,288, chiefly Chinese; 1908, 57,809. The group was ceded to Japan, together with Formosa, in 1895, and is now an administrative dependency of Formosa.

PESCARA, pēs-kā'ra, FERNANDO FRANCESCO D' AVALOS, MARQUIS OF (c.1489-1525). A Neapolitan general in the Spanish service. He was taken prisoner by the French at the battle of Ravenna in 1512. During his captivity he composed poems addressed to his wife, Vittoria Colonna. Being soon after ransomed, he took part in several minor battles and contributed greatly to the victory over the French at Pavia in 1525, but was severely wounded. He commanded the army in Italy after the battle and was approached by Morone, the counselor of Francesco Sforza, Duke of Milan, in the interest of an Italian national party, since it was believed that Pescara was dissatisfied with Charles V for not rewarding his services sufficiently. Pescara, however, betrayed the plot. He died soon after, Nov. 30, 1525.

PESCHIERA, pēs-kyā'ra. A fortified town in the Province of Verona, Italy, at the mouth of the Mincio River on the south shore of Lake Garda, 15 miles west of Verona (Map: Italy, C 2). It was a member of the famous Quadrilateral (q.v.) until 1860. In the Middle Ages it was known as Piscaria, and belonged first to Verona and later to the Venetians, who strengthened its fortifications. It became part of Italy in 1866. Pop. (commune), 1901, 2351; 1911, 2801.

PESCIA, pēsh'ā. A town in the Province of Lucca, Italy, 29 miles west by north of Florence, on the Pistoia-Pisa Railroad. It has a fourteenth-century cathedral, the church of San Francesco and an old castle. There are manufactures of silk, leather, paper, and hats, and a trade in wine, olives, and fruit. Pop. (commune), 1901, 17,517; 1911, 17,882.

PESELLINO, pāzēl'ē'nō, FRANCESCO DI STEFANO (c.1422-57). A Florentine painter of the Renaissance, born in Florence. He was the grandson, and perhaps the pupil, of Giuliano Pesello, and was influenced by Filippo Lippi and Masaccio. His work is broad, quiet in tone, and shows great personal feeling and a sense for style. His remaining paintings are chiefly decorative panels—often part of a chest—such as "Scenes from the Argonauts," in the Metropolitan Museum, New York, and the "Triumphs of Petrarch," in the Gardner collection, Boston; or small madonna pictures, good examples of which are in the Metropolitan Museum, the Musée Condé, Chantilly, and Dorchester House, London. There also survive fragments of altarpieces, including the fine predella in the Louvre and the Accademia, Florence, and a "Trinity" in the National Gallery, London, thought to have been completed by Lippi. Consult Werner Weisbach, *Francesco Pesellino und die Romantik der Renaissance* (Berlin, 1901).

PESHAWAR, or **PESHAWUR**, peshā'wēr. The capital of the Northwest Frontier Province, British India, on the river Bara, a tributary of the Indus, 20 miles from the Afghan frontier

and 10½ miles east of the entrance to the Khyber Pass (q.v.) (Map: India, B 2). It is irregularly built, with narrow winding streets, and is surrounded by a mud wall with watch towers. Although it dates from the fifth century, the city has few ancient monuments, and consists chiefly of mud houses. The cantonments contain a public garden, Christian churches, and a mission school. Being on a natural trade route from Central Asia, Peshawar is an important market; its bazars are frequented by numerous Afghan and other trans-Himalayan merchants who deal in horses, woolen goods, silks, dyestuffs, gems, and carpets. Local manufactures consist of scarfs, cloth, and arms. Peshawar is the terminus of a railroad connecting it with the main railroad system of India. Two miles from the city is an important British military station. Pop., 1901, 95,147; 1911, 97,935, of whom three-fourths are Mohammedans and 4000 Christians.

PESHITO, pē-shē'tō, or **PESHITTO**. See BIBLE, IV. *The Versions of the Bible*; III. *Aramaic*.

PESHWA, pēsh'wā (Pers., leader). The Brahman ministers of the Mahratta, or Marāthā, dynasty of India. On the decline of the Mahratta rulers the power of their ministers increased until in 1718 the first Peshwa, Balaji Vishvanāth, acting in the name of Maharajah Sahu, marched against Delhi to assist Farrukh Shah against the Mogul Emperor, Jehandar Shah. The Peshwa rule lasted for exactly a century. Balaji was succeeded in 1720 by his son, Baji Rao, who for 20 years was active in expeditions of conquest, even wresting Bassem from the Portuguese in 1739. He was followed in 1740 by his son Balaji Baji Rao, under whose administration the Mahrattas reached the acme of their greatness. They ravaged northern India far and wide, levied *chauth*, or a quarter tax, on Bengal, and were in formal possession of Orissa. In 1761, however, the last year of Balaji's life, the power of the Peshwas in northern India was ended by their rout at Panipat by Ahmed Shah of Kabul, conqueror of the Punjab. Balaji was succeeded, in 1761, by his son, Madhu Rao, who proved more than a match for Hyder Ali, and at the same time governed with remarkable order the Mahrattas themselves. In 1773, after the assassination of Narayan Rao, who ruled for a short time after Madhu's death in 1772, Raghunath Rao, a brother of Balaji Rao, became Peshwa. To defend himself against Narayan's posthumous son, Madhu Rao II, he was forced to call upon the English for aid. The First Mahratta War (1779-82) then broke out, in which Raghunath failed in his object, despite the aid of the English, and in 1782 he became a prisoner, while Madhu Rao succeeded him as Peshwa. Madhu committed suicide in 1795, after a puppet reign, and was followed in 1796 by Raghunath's son, Baji Rao II, the last of the Peshwas. To secure himself, Baji invoked English assistance, and by the Treaty of Bassem in 1802 ceded territory for the maintenance of the force given him. The result was an attack by the other Mahratta rulers and the Second Mahratta War (1803). This gave the Peshwa a prolongation of his rule, but he revolted in 1817. The Third Mahratta War, which followed, ended in utter defeat for Baji and the extinction of the Peshwa power. His territory, which now forms the Bombay Presidency, was annexed by the English, and Baji Rao was a British pensioner until his

death in 1852. His adopted son was the notorious Nana Sahib (q.v.). Consult Stanley Lane-Poole, *Medieval India under Mohammedan Rule 712-1764* (New York, 1903), and James Burgess, *The Chronology of Modern India, 1494-1894* (Edinburgh, 1913). See SINDIA.

PESNÉ, pán, ANTOINE (1683-1757). A French portrait painter, born in Paris. He studied under his father, Thomas, and his uncle, Charles de la Fosse, and afterward traveled in Italy. In 1710 he was summoned to Berlin by Frederick William I, and passed most of his life there, becoming court painter to Frederick the Great and director of the Academy. His portraits of Frederick the Great and of the engraver Schmidt, in the Berlin Museum, and that of Vleughels, in the Louvre, are vigorously and solidly painted, and many other excellent portraits, including those of all the Prussian royal family, are in the galleries of Dresden, Munich, and Brunswick, and in the royal palaces of Berlin and Potsdam.

PES PLANUS. See FLATFOOT.

PESSIMISM (from Lat. *pessimus*, worst). The doctrine that life is, or tends to become, wholly undesirable, or that the world is essentially evil. It is thus contrasted with optimism (q.v.), which teaches that the world is essentially good, and with meliorism, which maintains that the world is constantly becoming better and life more endurable.

Pessimism is characteristically a mental attitude towards life rather than a philosophical doctrine, and its significance is ethical rather than metaphysical. It usually appears, however, as a consequence of reflection and so of a certain amount of intellectual enlightenment. Most commonly it is the outgrowth of a consciousness of human impotence, and especially of the inadequacy of human effort in the struggle for ideal attainment. Where pessimism is based upon metaphysics the world is usually conceived to be governed by blind necessity and human life to be a toy of fate. Accordingly the doctrine is most commonly maintained by those who hold a pantheistic conception of the universe, as the Orientals, or by those who conceive it as wholly determined by mechanical laws or as wholly materialistic. Optimism, on the other hand, is almost an inseparable corollary of belief in an omnipotent and beneficent God, and so is characteristic of theistic religions. (See LEIBNITZ for the argument.) At the same time there is a purely empirical pessimism—the denial that human life per se is worth while—which is compatible with any cosmological conception, whether theistic or not. Such a pessimism is that of the author of Ecclesiastes, and such a pessimism is the implied basis of Christian asceticism, by which physical life is valued only as a discipline for a more worthy existence.

Historically, philosophical pessimism has been of two leading types. Perhaps the most ancient is the pessimism of India, the essential character of which is the denial of the value of life on the ground that its pains overbalance its pleasures and progressively tend to do so with the growth of desire. This doctrine does not appear in the Vedic hymns; for these belonged to the restless, active period of the history of the Aryans in India, and activity is little compatible with pessimistic theory; but it early developed with Brahmanistic pantheism and attained its full growth in Buddhism (q.v.). The salient features of Indian pessimism are: first, the asser-

tion that life is predominantly painful; second, the notion that conscious evolution is dominated by growing desire and growing failure to attain satisfaction; and, third, the conception of Nirvana, or annihilation of individual consciousness, as an ultimate relief from the fever of living.

In contrast to this Oriental pessimism stands the Greek type. This was faintly foreshadowed by the Platonic doctrine of the impotence of the material world in its efforts to attain the perfect good embodied in the divine ideas. Plato himself was saved from pessimism by the very vividness of his idealism; but with the philosophers who followed him the ethical problem became paramount and the problem of the existence of evil and the fact of human insufficiency were poignantly recognized. The most metaphysical and thoroughgoing of Greek pessimists was Proclus (q.v.), who taught that the whole evolution of the world is away from the divine or good.

But there was little congenial to pessimism in the exuberant paganism about the ancient Mediterranean; the classic peoples were too heartily in love with life. With the Teutonic Aryans the case was different. A gloomy fatalism was early characteristic of their myth and mood, and though the Northman looked forward to eventual annihilation in the cataclysm of Ragnarok (q.v.), the twilight of the gods, rather than through passive absorption, his ultimate conception varied little from that of the Brahman. And the Teutonic point of view seems to have dominated medieval Europe, giving it that ascetic pessimism which Christianity made empirical rather than ultimate. In modern times, however, pessimism has reasserted itself, largely under the influence of scientific determinism. The notion that the world is governed by invariable laws and conserves none but material elements has seemed to argue the defeat of the commonest human expectations. The pessimistic reaction has appeared most strongly in poets, notably in the Italian Leopardi (q.v.) and in James Thomson, the author of *The City of Dreadful Night*. In philosophy Schopenhauer and Hartmann (qq.v.) are the chief exponents of modern pessimism. Schopenhauer as a follower of Kant believed that the world of phenomena is a system of ideas, but that each person experiences directly in himself his own will as being the inner reality of that which presents itself to him in the world of phenomena as his body. Hence Schopenhauer reasons that will is the ultimate nature of all reality. But he regarded this fundamental will as blind, uneasy, hapless tending, while intelligence is a suffering consequence of the will's activity. The painfulness of conscious life he endeavored to establish upon empirical, psychological grounds, and this feature of his pessimism is plainly Oriental in source. His further doctrine, however—that final escape from the misery of existence is to be attained through pure intelligence defeating the blind energy of the will by overcoming desire—seems to be allied not only to Brahmanism, but also to the Platonic doctrine of escape to the world of divine ideas and the Spinozistic theory of immortality through the soul's identification with eternal verities. (See PLATO; SPINOZA.) Schopenhauer's disciple, Hartmann, carried the doctrine further by arguing that the evolution of consciousness from an unconscious universe must ultimately result in an intelli-

gence so acutely powerful that it should not only put an end to individual consciousness and desire, but compel the whole world's suicide.

It is but fair to state that pessimism is not necessarily a result of deterministic metaphysics nor yet of pantheism. Herbert Spencer's meliorism teaches that the world is compelled to evolve desirable existence, and, indeed, that its essential activity is one of betterment; while Nietzsche, originally a disciple of Schopenhauer, finds optimistic inspiration in the thought that all reality is a will to power, whose highest expression in the superman is its fullest justification; the necessity for pain he recognizes, but counts it of small import in comparison.

B. Saunders (3d ed., ib., 1892); A. J. Dörner, *Pessimismus, Nietzsche und Naturalismus* (Leipzig, 1911).

PES/SINUS (Lat., from Gk. Πέσσινοῦς, *Pessinonous*). An important Phrygian city of Galatia (q.v.), on the river Sangarius, and on the southern slopes of Mount Dindymus. It passed under the control of the Gauls, about 164 B.C., and became an important commercial centre. The city was best known, however, both before and after that event, as the chief centre of the worship of Cybele (q.v.). The city passed from Gallic to Roman control. In the fourth Christian century Pessinus was the capital of Galatia Secunda or Galatia Salutaris and seat of a bishopric. From the sixteenth century onward the city was dismantled to build the fortress of Justinianopolis, 8 or 9 miles northwest, known now as Sivri-Hissar.

PEST, *pěst* A city of Hungary, now united with Buda to form Budapest (q.v.).

PESTALOZZI, *pës'tà-lòt'sè*, JOHANN HEINRICH (1746-1827). A Swiss educational reformer and the chief founder of modern pedagogy, born at Zurich, Jan. 12, 1746. As a student in the University of Zurich he allied himself with the young reformers of whom Lavater was the leader, and in a contribution to the *Memorial*, the organ of that faction, he expressed a wish that intelligible principles of education might be disseminated among his countrymen. He studied theology, then law, then, under the influence of the current naturalistic philosophy, and particularly Rousseau, turned to agriculture, with the avowed purpose of improving the condition of his countrymen by setting for them a good example in scientific agriculture, and, finally, when past middle life, began work as a teacher. He undertook to put in constructive form the ideas cast by Rousseau in a destructive and critical form. He it was who tested the value of education according to nature. Pestalozzi himself was unpractical and a bad organizer and manager, yet through his writings he aroused the Germanic peoples to the importance of social reform through education, and through his personal efforts he inspired a number of disciples who developed and carried out the principles of his practice until they became the basis of the educational movement

of the nineteenth century. In 1767 he bought 100 acres of poor land and erected a house thereon, naming the place Neuhof. Here he brought, two years later, his bride, and here for seven years he sought to demonstrate Rousseau's ideal life in a return to nature. Though the experiment was a failure, yet in his attempt to educate his one child after the manner of the *Emile* he discovered the deficiencies of Rousseau's teachings, and later rejected the extravagances and accepted the essential truths of the teachings of his master. Here also he wrote a *Father's Journal*, which laid the basis of modern child study as an approach to the solution of educational problems. Undaunted by poverty and failure and moved by the wretched state of the children of the poor, in 1775 he turned the farm into an asylum, where he housed, boarded, and clothed the children, in return for such work as they could give, thus hoping to regenerate his people by striking at the root of the evil through the industrial education of the young. The failure of this enterprise in 1780, due in a measure to the unsympathetic attitude of the parents of his wards, revealed to him the doubtful nature of the principle upon which it had been based, viz., that the reform of the individual and of the race could come through an improvement of the environment. Then followed a period of 18 years of financial distress and a corresponding period of great literary activity. During this time he gave up all practical efforts and devoted his energies to thinking out social and educational problems. The solution reached was that individual and social reform can come only through the moral and intellectual improvement of the individual by means of educational effort. In his *Abendstunde eines Einsiedlers* (published 1780) and his *Lienhardt und Gertrud*, the first volume of which was issued in 1781, he first presented this doctrine. The latter work, soon expanded into several volumes, was a novel descriptive of peasant life, which had an enormous popularity, since it fell in with the idealistic and revolutionary tendencies of the times.

The fundamental ideas of *Lienhardt und Gertrud* were that the condition of the people was to be bettered by education, not by revolution; that education was to centre in the home and not in a separate institution; that this education was to begin at the cradle and that the first few years were of the greatest importance; that an ignorant mother, by following the method given in his book, could educate her children as well as a teacher in possession of all science; that if homes were thus reformed misery would disappear and society would be revolutionized. From 1787 to 1797 Pestalozzi was again engaged in agricultural experiments. During this period he formed the acquaintance of Fellenberg and Fichte, and in 1792 was proclaimed French citizen with Klopstock and Washington. After the long period of literary work, during which Pestalozzi wrote 20 volumes, the exigencies of war forced him again into active life, and in 1798 he became director of an orphan asylum at Stanz, where he attempted to work out the ideas of *Leonard and Gertrude* (as the work is known in English), of combining learning with handwork and centering it upon the objects of the child's immediate environment. It was along this line that Pestalozzi thereafter worked and had his permanent influence. In 1799 he entered upon active schoolroom work at Burgdorf, and later at several other places.

In 1802 Pestalozzi went to Paris as a member of the consulta summoned by Bonaparte to settle the fate of Switzerland, and while there memorialized the First Consul upon the educational needs of his country, but received the curt reply that there was no time to bother about A B C matters. He established the Institute at Yverdon in 1805, from which emanated the influence that was to give inspiration to all modern education. Here gathered not only the children of the schools, but great numbers of teachers from most of the leading states in Europe in a sort of normal school; here were sent by the Prussian government the teachers that were to assist in introducing his ideas into the German Volksschulen; and here he was visited by several Americans, whose reports on their return exercised a profound influence on the United States. Even here his work as a practical teacher was unsuccessful, largely through his inability to deal with a few of his assistants, and in 1825 he was forced to withdraw as a broken-down and disappointed old man. He died at Brugg, Feb. 17, 1827.

Pestalozzi never systematized his ideas or his method. In 1801 he published *Wie Gertrud ihre Kinder lehrt*, which purports to give a summary of his work, but it contains no definite formulation of either principle or method. His great effort, on the purely educational side, was, to use his own expression, to "psychologize education." To this effort is due the great attention that has been given to the study of method, both practical and theoretical, from that day to this.

Bibliography. In addition to many editions of single works, there is a complete edition in 18 volumes by Seyffarth (Berlin, 1881); *Lienhardt und Gertrud* has numerous translations or abridgments, as also *Wie Gertrud ihre Kinder lehrt*. Consult also: Roger de Guimps, *Pestalozzi: Life and Work*, translated from the second French edition by J. Russell (New York, 1890); J. A. Pinloche, *Pestalozzi and the Foundation of the Modern Elementary School* (ib., 1901); Hermann Krüsi, *Pestalozzi: His Life, Work, and Influence* (ib., 1903); Henry Barnard, *Pestalozzi and his Educational System* (Syracuse, 1906); Gabriel Compayré, *Pestalozzi and Elementary Education* (New York, 1907); Henry Holman, *Pestalozzi: An Account of his Life and Works* (ib., 1908); J. A. Green, *Life and Work of Pestalozzi* (Baltimore, 1914); id., *Educational Ideas of Pestalozzi* (ib., 1914).

PESTALOZZIAN (pēs'tā-lōt'si-ān) **MOVEMENT.** A term sometimes applied to the modern tendency to base schoolroom instruction on psychologic principles. It dates from the days of Pestalozzi (q.v.). This movement began in Germany in the early part of the nineteenth century and was initiated in the United States by Horace Mann (q.v.). Consult W. S. Monroe, *History of the Pestalozzian Movement in the United States* (Syracuse, 1907). See **EDUCATION**; **OBJECT TEACHING**; **PEDAGOGY**.

PES'TILENCE (OF., Fr. *pestilence*, from Lat. *pestilentia*, plague, from *pestilens*, infected, from *pestis*, pest). The terms "plague" and "pestilence" have until recent times been used indiscriminately to denote any diseases of an epidemic character which affected large masses of the community and were remarkable for their fatality, such as the Oriental plague, the sweating sickness, cholera, certain virulent forms of fever, etc. The term "loimos" was applied by the Greeks

to a species of epidemic remittent fever; and the plague of Athens described by Thucydides is manifestly an epidemic form of the same disease, which is endemic in the summer season on the coasts and islands of the Mediterranean and particularly the Archipelago. We find in the early history of the colonization of the West Indian islands and the United States frequent examples of the term "plague" being applied to the remittent fever of these regions, and especially to epidemic attacks of yellow fever. During the Middle Ages the term "pestis" was applied to numerous disorders, such as syphilis, smallpox, erysipelas, epidemic sore throat, petechial fever, the sweating sickness, gangrenous pneumonia, ergotism, etc. The Black Death of the fourteenth, fifteenth, and sixteenth centuries was the bubonic plague; and the Great Plagues in China in the fourteenth century were probably also bubonic.

Several Hebrew words are translated "pestilence" or "plague" in the Old Testament. Some of these pestilences are beyond the reach of inquiry; others have the characteristics of modern epidemics. See **BLACK DEATH**; **PLAGUE**.

PESTO. See **PÆSTUM**.

PET'AL (from Gk. *πέταλον*, *petalon*, leaf, neut. sing. of *πέταλος*, *petalos*, outspread). One of the individual parts of the corolla (q.v.), the inner set of floral leaves, which is usually the showy set. See **FLOWER**.

PET'ALESHA'RO. A Pawnee chief of the Skidi band who distinguished himself by an act of humane bravery in rescuing a captive girl who was about to be sacrificed by his tribe. The captive, a girl taken from the Sioux tribe, was being led to the scaffold when Petaleshoro, who as yet was only a young warrior, broke through the circle, seized the girl, and, throwing her upon one of two horses which he had in waiting, was off with her before the people could recover from their surprise. Distancing pursuers, he escorted her to a place of safety near her own country, and then left her to find her way home on the horse which he gave her. On returning to his village he faced the anger of the tribe with such boldness that he was allowed to go unharmed, and was ultimately able to break up the practice of human sacrifice by procuring the substitution of a vicarious ceremony. On subsequently visiting Washington as a delegate from the Pawnee in 1821 he was presented with a medal by the ladies of the city in recognition of his services to humanity. See **PAWNEE**.

PET'ALODY (from Gk. *πεταλῶδης*, *petalōdēs*, leaflike, from *πέταλον*, *petalon*, petal + *εἶδος*, *eidos*, form), or **PET'ALIZA'TION**. The replacement of other organs of the flower, especially the stamens and pistils, by petals. It results in what is known as double flowers. All stages in the transition to petals are seen in the stamens of the white water lily. The exact cause of petalody is not known, and double flowers so frequently seen in cultivation are regarded as sports, but are often associated with conditions of high nutrition.

PETALUMA, pet'ā-lōō'mā. A city in Sonoma Co., Cal., 36 miles by rail north of San Francisco, at the head of navigation on Petaluma River, an arm of San Francisco Bay, and on the Northwestern Pacific and the Petaluma and Santa Rosa railroads (Map: California, C 4). Noteworthy features are the Carnegie library, Hill Plaza and Walnut parks, and Pepper Kin-

dergarten. Petaluma is situated in one of the most productive poultry regions in the country, the marketing of eggs and fowl being the most important industry of the city. Others include silk and flour mills, machine shops and foundries, incubator plants, shoe, saddletree, gas-engine, box, cheese, and vinegar factories, feed, grist and planing mills, tanneries, etc. Pop., 1900, 3871; 1910, 5880.

PETARD, pé-târd' (OF. *petard*, *petart*, Fr. *pétard*). A device for demolishing the defenses of an enemy, creating a breach through which the besiegers may force an entry. Under modern conditions it has become obsolete. It consisted of a half cone of thick iron filled with powder and ball and fastened to a plank which was provided with hooks, by which it could be attached to a gate or wall. The engineers attached the petard, lighted the slow-burning match by which it was to be fired, and retired. When the explosion took effect a supporting column charged through the breach and took advantage of the confusion within. A petard would sometimes contain 15 pounds of powder.

PETAIVIUS, DIONYSIUS, or DENIS PÉTAU (1583-1652). A French theologian and philologist, born at Orléans. His father, a man of learning, encouraged his studies, and he took up mathematics and belles-lettres, also philosophy, which he pursued both at Orléans and Paris. During his student years at Paris he formed a warm friendship with Isaac Casaubon (q.v.), whom King Henry IV had invited to Paris in 1600. In 1602 he accepted the chair of philosophy in the University of Bourges, but resigned in 1605 and entered the Jesuit Order at Nancy. He studied theology for two years at the College of Pont-à-Mousson, and in 1621 became professor of *theologia positiva* at the University of Paris and held the post till 1643, when he retired and devoted the rest of his life to his work on theology. He is regarded as one of the greatest scholars the Jesuit Order has possessed. In philology his works include annotated editions of Synesius (1611), Themistius (1613), Julian (1614), Nicéphorus (*Breviarum Historicum*, 1616), and Epiphanius (*Opera Omnia*, 1622). In his *Opus de Doctrina Temporum* (Paris, 1627) he presented a new system of chronology, further developed in *Urano-logion* (1630). A history of the world, *Rationarium Temporum* (1633), from the earliest times down to 1632, has been reprinted as late as 1849. His great work, a history of doctrines, *Opus de Theologicis Dogmatibus* (5 vols., 1644-50), was left unfinished. Consult Franz Stanonik, *Dionysius Petavius: ein Beitrag zur gelehrten Geschichte des 17. Jahrhunderts* (Graz, 1876), and J. C. V. Chatellain, *Le Père Denis Pétau* (Paris, 1884).

PETCHARY, péch'â-ri (West Indian name, onomatopoeitic in origin). An old book name for the large tyrant flycatchers of the West Indies, known elsewhere as kingbirds. The term has survived, however, in Jamaica for the gray kingbird (*Tyrannus dominicensis*), and especially for *Tyrannus caudifasciatus*, one of the most common birds of the West Indies, often shot in the fall as a table delicacy. See KINGBIRD.

PETCHNIKOV, péch'ni-kóf, ALEXANDER (1873-). A Russian violinist. He was born at Yeletz in the Province of Orël and at the age of 10 entered the Moscow Conservatory, where he studied under Johann Hrimaly, winning the first prize and a gold medal. After

his début as a violin virtuoso in Berlin (1895) he made several successful tours in Europe and in America, playing in recital and with the best orchestras. He made Berlin his residence.

PETCHORA, pâ-chô'ra, or **PECHORA**. A river of north Russia. It rises on the west slopes of the Ural Mountains, in the Government of Perm, and flows northward through the Government of Vologda and a part of Archangel; then it turns to the southwest and finally resumes its original course at the mouth of its tributary the Tsylma, and enters the Arctic Ocean through an extensive delta, 125 miles long, containing numerous islets (Map: Russia, H 1). Its entire length is estimated at nearly 1000 miles, of which most is navigable except during the winter, when the upper reaches are frozen for 190 days and the lower reaches for 138 days. The chief tributaries are the Koshva, Ishma, Ussa, and Tsylma. The region through which the river flows is known as the Petchora, or Arctic steppes. The Petchora is of considerable importance as a navigable waterway, being used for the transportation of fur, fish, etc., into the interior, from which grain and other necessities of life are sent in return into the northern districts. Consult J. A. Harvie-Brown, *Travels of a Naturalist in Northern Europe* (2 vols, London, 1905).

PETECHIA, pé-ték'â (Neo-Lat., from It. *petecchia*, spot, scab, from Lat. *petigo*, scab, or from Lat. *pittacium*, from Gk. *πῖττακιον*, *pittakion*, label, plaster). A name given to a minute hemorrhagic spot of a dusky crimson or purple color, quite flat, with a well-defined margin and unaffected by pressure, which closely resembles fleabites. Petechiæ result from a minute extravasation of blood beneath the cuticle. They may occur on any part of the skin or mucous membranes, and when large are called ecchymoses. They indicate an altered state of the blood and are often symptoms of very serious diseases, as typhus fever, plague, and scurvy. They likewise occur in very severe cases of smallpox, measles, and scarlet fever, when their presence must be regarded as indicative of extreme danger. Cerebrospinal fever is sometimes called petechial fever, from the small hemorrhagic spots which cover the body in certain cases.

PETER (Lat. *Petrus*, from Gk. *πέτρος*, *petros*, rock), or **SIMON PETER**. One of the Twelve Apostles of Jesus Christ. His original name was the Hebrew *Shim'ôn*, or *Simeon*, which was easily shortened to conform to the Greek Simon. He was the son of a certain Jona and (cf. John i. 44) was a native of Bethsaida. In his early manhood he was a citizen of Capernaum. Here he had a house, and with his brother Andrew was engaged in the fishing business in partnership with Zebedee and his sons (Mark i. 16-31 and parallels). He was married, but whether he had any children is not known. It is likely that he was a man of some property, not a poor, grossly ignorant laborer, though he was not rich. Of his early education and attainments we know nothing. Galilee, his home, was practically a bilingual country, with a fair degree of Greek culture possessed by the Gentile elements of the population. Hence Simon had opportunity for becoming acquainted with colloquial Greek, and there is no good reason for supposing that he was unable to use his Greek Old Testament intelligently.

When the news of the preaching of John the Baptist reached Galilee Simon and Andrew went

to hear him. They were impressed and attached themselves to him as at least temporary disciples. Here they became acquainted with Jesus, who gave to Simon the Aramaic surname Cephas, rock, whence his Greek name Peter (John i. 35-42). After continuing with Jesus a while the brothers returned to their accustomed occupation. Soon after he opened his public ministry in Galilee Jesus summoned them from their nets to a permanent discipleship (Mark i. 16 and parallels). They at once left all and followed him. Into the details of Peter's experiences during his two years' intimate association with Jesus we cannot enter. The many incidents recorded in the Gospels give a fairly adequate idea of his general character and disposition. He was a whole-hearted though often blundering disciple. His willingness to be taught enabled him finally to grasp certain great essentials of Jesus' character and mission, so that Jesus could say that he was the rock on which he would build his Church (Matt. xvi. 18). He was one of the three disciples with whom Jesus was most intimate, who alone witnessed his transfiguration (Mark ix. 2-10) and the agony in Gethsemane (Mark xiv. 33). Thoroughly convinced of Jesus' Messiahship, even when the tide of popular favor had begun to ebb, he was yet in great need of enlightenment as to what it really signified (Mark viii. 29-33). His impulsive nature led him to deny his discipleship when Jesus was on trial, but his deeper and more permanent love for his Master soon reasserted itself, and he returned to the scene and was an eyewitness of the Passion. (Cf. 1 Peter v. 1, and the article PETER, EPISTLES OF.) He was the first of the Apostles to whom Jesus revealed himself after his resurrection (1 Cor. xv. 5; cf. Luke xxiv. 34), was present at most of the post-resurrection interviews between Jesus and the disciples, and to him in particular Jesus tenderly and suggestively reentrusted his apostolic commission, at the same time intimating the self-denial and suffering that awaited him in his future career (John xxi. 15 et seq.).

After the departure of Jesus Peter was easily recognized as one of the leading spirits of the little company of believers who were hoping for something, just what they did not know, and who formed the nucleus of the Church. It was he who suggested the appointment of Matthias to take the place of Judas Iscariot, and a few days later, on the day of Pentecost, made the first public attempt to explain and set forth the claims of Christianity and urge its acceptance upon his fellow Jews. (Acts i and ii.) It is interesting to note how rudimentary and undeveloped are the definitions of the chief points of the Christian faith as stated by Peter in the Pentecost sermon. The main problem was how to prove to the Jews that the Jesus they had crucified was really the Messiah, and the chief dependence was naturally upon such Old Testament passages as seemed to support this position. During the next few years, when the first converts were being secured and the first steps in organization planned, Peter seems to have been the most influential man in the Church. His fellow worker and most intimate friend was John. When Christianity spread beyond the bounds of Jerusalem into the various districts of Palestine, Peter and John, and afterward Peter alone, rendered efficient aid by visiting and further instructing the new con-

verts. In Samaria, on such a visit, he came in contact with the local magician Simon Magus (q.v.), a professed convert, whose ignorant cupidity he sternly rebuked. (Acts viii. 20.) Another such tour led him as far as Joppa, on the coast, whence, by divine guidance, but against his prejudices, he went to Caesarea to proclaim Christianity to Cornelius, the Gentile centurion. He received him and his house into Christian fellowship, and set aside his prejudices so far as to sit at table with them, something he had never before done. (Acts x.) For such conduct an explanation was demanded by some in the mother Church. Though it was pronounced satisfactory, it is probable that certain ultra-conservatives did not approve of what had been done. (Acts xi.)

Up to the attempt of Herod Agrippa I to put him out of the way, i.e., near A.D. 44, or for about 15 years (cf. Acts xii. 3 et seq.), it is probable that Peter made his headquarters in Jerusalem. He was the one member of the apostolic band whom Paul, three years after his conversion, went to Jerusalem to consult. (Cf. Gal. i. 18.) Paul was with Peter 15 days, and in that time was doubtless given a full account of the earthly career of Jesus as complete as Peter's memory allowed. This notice from Paul's own letter is weighty evidence as to Peter's influential position in primitive Christian circles.

After his escape from Herod he left Jerusalem. We know nothing more of him until the time of the Council of Jerusalem (49 A.D.). Here, with characteristic loyalty to the witness of the Holy Spirit, he urged a liberal attitude towards Gentile Christians. With James and John he gave Paul and Barnabas the right hand of fellowship. Soon after this he seems to have visited Antioch (Gal. ii. 11 et seq.), and, true to his principles, fellowshipped heartily with the Gentile members of the Church there, making no distinction between them and himself. But when overzealous emissaries from James of Jerusalem came to Antioch and insisted that the two classes should not eat together, Peter vacillated and weakly submitted to their dictation. This brought forth a sharp and well-deserved public rebuke from Paul. (Gal. ii. 14 et seq.) There is no reason to suppose that this resulted in any lasting personal animosity between the two. As the years passed Peter's views of Christian truth broadened and deepened, partly through the influence of Paul's doctrines, but also because of his own honest and earnest spirit. Of Peter's further career we possess almost no information. It is probable that he continued to be occupied in missionary labors, mainly among Jewish communities, in accordance with the agreement noted in Gal. ii. 9. On his journeys he was accompanied by his wife. (1 Cor. ix. 5.) In 1 Cor. i. 12 (written about 53 or 54 A.D.) reference is made to a Cephas party in the Corinthian church, but this does not imply necessarily that Peter had personally visited Corinth. If the word Babylon (1 Peter v. 13) is to be taken literally, he must have labored mainly in eastern Syria and the Tigris-Euphrates valley. But Babylon may be only another name for Rome and is usually so interpreted. The view that Peter wrote 1 Peter at Rome between 56 and 59 A.D. to Jewish and other Christian communities of Asia Minor has no decisive evidence against it, but of the corresponding view that 2 Peter was likewise sent

from the same city, only at least 10 years later and to a different circle, the same cannot be said. The whole matter of Peter's presence in Rome at any time rests, it must be admitted, on a very insecure foundation. There is no positive evidence to that effect in the New Testament, and the earliest notice of Peter in early Christian literature (1 Clement, v) is equally indecisive. The next earliest notice (Ignatius, *Ep. ad Rom.*, IV, 3), about 110 A.D., is almost as vague. Later writers (Justin Martyr is a notable exception) generally represent Peter as having labored long and suffered martyrdom in Rome. While obviously unhistorical legends, such as those relating to his controversy with Simon Magus, have grown up in order to fill out a complete story, his residence in Rome for a longer or shorter period is usually accepted, not only by Roman Catholics, but by Protestant scholars of high rank. That he was martyred under Nero about the year 64 is probable, though not certain. Tradition relates that he met his death by crucifixion, but at his own request with his head downward, counting himself unworthy to suffer exactly in the same way as his Master. Roman Catholics reckon St. Peter as the first Bishop of Rome and the first Pope.

PETER I, ALEXEYEVITCH (1672-1725). Emperor of Russia from 1682 to 1725, generally known as Peter the Great. He was the son of the Czar Alexei Mikhailovitch by his second wife, Natalia Naryshkin, and was born at Moscow, June 9 (May 30), 1672. Peter's half brother Feodor, who succeeded his father in 1676, died without issue in 1682, having named Peter as his successor, to the exclusion of his own full brother, Ivan, a feeble-minded prince. The Grand Duchess Sophia, Peter's half sister, attempted to set aside this arrangement and to obtain control of affairs. To this end she brought about an insurrection of the Streltsi (q.v.), and after much bloodshed Ivan and Peter were crowned as joint rulers and Sophia became Regent (July, 1682). Peter's education was not carefully looked after, and at an early age he gave evidence of those stormy passions which were to characterize his entire life. In February, 1689, Peter married Eudoxia Feodorovna Lopukhin, and soon after he called upon his sister to resign the government. This she would not do without a contest, and Peter was forced to flee from the capital, but the foreigners in the Russian service, led by Lefort and by Patrick Gordon (q.v.), joined his party, and when the Streltsi deserted her the Regent yielded

and was shut up in a convent. On Oct. 11, 1689, Peter made his public entry into Moscow, where he was met by Ivan, to whom he gave a nominal precedence, reserving the sole exercise of power for himself. Ivan died in 1696. Peter grasped the value and significance of Western civilization much more thoroughly than any of his predecessors. He at once began the slow task of forming out of the barbarous and undisciplined material available an army on the European model. His ambitions were chiefly directed, however, towards creating a navy and developing the commerce of his country. Russia had little seaboard, being shut out from the Baltic by Sweden, which possessed Finland, Ingermanland, Esthonia, and Livonia, and from the Black Sea by Turkey, leaving only the White Sea and the Arctic Ocean, with the solitary port of Archangel, available for a Russian navy. Peter therefore set on foot what has become the established Russian policy, of seeking in every direction an outlet into ice-free seas. The Black Sea seemed to him to be the most available for a first move. He launched Russia upon her career of warfare against the Turks, and succeeded in making himself master of the city of Azov, at the mouth of the Don, in 1696. Peter brought in engineers, naval architects, and ordnance experts from Austria, Venice, Prussia, and Holland; built ships; improved the equipment and discipline of the army, and sent many of the young nobility to study in foreign countries. After repressing a revolt of the Streltsi in February, 1697, Peter put the administration into the hands of a council and left Russia in April, traveling as a subordinate member of an embassy, headed by Lefort, for the purpose of acquiring at first hand the knowledge necessary to develop his Empire. He thus visited the Baltic provinces, Prussia, and Hanover, and subsequently Holland, where at Amsterdam and Saardam he worked as a common shipwright. On the invitation of William III, King of England, he visited that country, remaining for three months. He left England in April, 1698, taking with him about 500 English engineers, surgeons, and artisans, and visited Vienna for the purpose of inspecting the Austrian army. His travels were cut short by a second revolt of the Streltsi, which necessitated his return to Russia in September, 1698. General Gordon had crushed the revolt, but Peter determined to be finally rid of this turbulent soldiery, and the organization was broken up and many of its members were executed. Peter divorced the Czarina Eudoxia, who with his sister Martha was suspected of complicity in the outbreak, which had been fostered by the Old Russian party. The process of introducing Western civilization continued. Printing and education were promoted, the calendar was partially reformed, and Western methods of enumeration were introduced. Systematic taxation of commodities was adopted as a source of revenue; foreign commerce was encouraged; and much of the Orientalism in dress, manners, and customs which had grown up during the Mongol supremacy gave place to the ways of the Occident. The Church was reorganized, its government being intrusted to the Holy Synod, of which the Czar was the head.

Having secured to Russia access to the sea on the south, Peter turned his eyes towards the Baltic, the possession of whose shores he determined to dispute with Sweden. That kingdom

since the time of Gustavus Adolphus had been the strongest military power in northern Europe. In 1700 Peter made an alliance with Sweden's enemies, Denmark and Poland, and threw down the gauntlet in the struggle for the Baltic supremacy. He was badly defeated by Charles XII at Narva, where his raw troops, although vastly superior in numbers, were wholly unable to cope with the Swedish veterans (Nov. 30, 1700). Peter was not disheartened. Taking advantage of the Swedes being employed elsewhere, he seized a portion of Ingermanland, in which he laid the foundation of the new capital, St. Petersburg (1703). Great inducements were held out to those who would reside in it, and in a few years it became Russia's commercial depot for the Baltic. For a long time in the contest with Sweden the Russians met with defeat, but Peter saw that reverses were administering to his troops a wholesome discipline. In 1709 Charles XII rashly invaded South Russia, and on July 8 his army was annihilated by the Czar at Poltava. This event marked the collapse of the Swedish power. In the following year Peter was master of Livonia. He now found himself at war with the Turks, whom Charles XII, who had taken refuge among them, had stirred up to hostilities. In 1711 Peter was caught in a trap on the Pruth and was forced to conclude the Treaty of Hush (July 23), by which he gave up the port of Azov and the territory belonging to it. On March 2, 1712, Peter's marriage with his mistress, Catharine (see CATHARINE I), was celebrated at St. Petersburg, and two months afterward the central government was transferred to the new capital. The war against Sweden was prosecuted with energy and success. In 1713 the Swedish general Stenbock was forced by the Danes, Saxons, and Russians to surrender at Tönning in Schleswig. About the same time the Russians made themselves masters of Finland, and in 1714 the Russian fleet overwhelmed the Swedes near the Åland Islands. In 1716 and 1717 Peter made another tour of Europe. In 1718 a widespread conspiracy looking towards the undoing of Peter's reforms was discovered and among those implicated was the Crown Prince Alexei Petrovitch (q.v.). Peter caused his son to be sentenced to death, but pardoned him later. The unfortunate prince, according to the most probable accounts, died in prison from the effects of the torture to which he had been subjected. In 1721 peace was made with Sweden, which surrendered to Russia Livonia, Esthonia, Ingermanland, Karelia, and a small portion of Finland, together with all the islands along the Baltic coast from Courland to Viborg. In the same year Peter assumed the title of Emperor of All the Russias. In 1722 Peter commenced a war with Persia in order to open the Caspian Sea to Russian commerce. Derbend and Baku were the fruits of this war. The last years of Peter's life were occupied chiefly in beautifying and improving his new capital and carrying out plans for the diffusion of knowledge among his subjects. In the autumn of 1724 he was seized with a serious illness, the result of his imprudence and habitual excesses, and after enduring much agony he died, Feb. 8 (Jan. 28), 1725.

Upon the political life of Russia Peter the Great left a powerful impress and he is regarded as the creator of modern Russia, which he definitely brought into the state system of

European nations. Peter the Great was a type of the benevolent despot of the eighteenth century, who sought to advance the progress of his people from above. The testament attributed to him, defining his policy, is probably spurious, but it doubtless expresses, with some elaboration, his ideas.

Bibliography. Benjamin Bergmann, *Peter der Grosse* (Königsberg, 1823-30); J. L. Motley, "Peter the Great," *North American Review* (October, 1845), a notable essay, since republished; Mintzlof, *Pierre le Grand dans la littérature étrangère* (St. Petersburg, 1872), containing bibliographical notes on 1200 works not Russian relating in some way to Peter; Alexander Brückner, *Peter der Grosse*, in the Oncken Series (Berlin, 1879); Eugene Schuyler, *Peter the Great* (2 vols., New York, 1884), one of the best biographies in English; Kazimierz Waliszewski, *Peter the Great*, English translation by Mary Lloyd (ib., 1900); John Barrow, *Life of Peter the Great* (ib., 1903); G. Cahen, *Histoire des relations de la Russie avec la Chine sous Pierre le Grand* (Paris, 1912); Pernet, *Pierre le Grand, mercantiliste* (ib., 1913). Among Russian works, mention should be made of Soloviev, Milioukov, and Philippov.

PETER II, ALEXEYEVITCH (1715-30). Emperor of Russia from 1727 to 1730. He was the son of Alexei, heir of Peter the Great, who died in prison. Peter II was born in St. Petersburg, Oct. 22 (11), 1715. In his childhood he was kept in seclusion and very much neglected. He ascended the throne on the death of Catharine I, May 17, 1727, and immediately fell under the influence of the ambitious Menshikoff, who affianced the youthful Czar to one of his daughters. Menshikoff, however, was soon overthrown by the Dolgoruki, who succeeded to his power. Peter was crowned in 1728, and in the following year was betrothed to a member of the Dolgoruki family. The marriage was set for Feb. 2, 1730, but a few days previously the Czar was stricken down by smallpox and died on February 9 (January 29). He was succeeded by Anna Ivanovna (q.v.).

PETER III, FEDOROVITCH (1728-62). Emperor of Russia in 1762. He was a grandson of Peter the Great by his daughter Anna, who was married to Duke Charles Frederick of Holstein-Gottorp, and was born at Kiel, March 3 (Feb. 21), 1728. The Empress Elizabeth Petrovna (q.v.) nominated him her successor to the throne after making him refuse the offer of the Swedish throne, much against his will. In 1745 he married Sophia Augusta, a princess of Anhalt-Zerbst, who, on entering the Greek church, assumed the name of Catharine. Peter succeeded Elizabeth on her death, Jan. 5, 1762. His first act of authority was to withdraw from the alliance with France and Austria against Prussia, restoring to Frederick II the Province of East Prussia, which had been conquered during the Seven Years' War, and sending to his aid a force of 15,000 men—a line of conduct which seems to have been prompted solely by his admiration for the Prussian sovereign. He also recalled many of the political exiles from Siberia, among whom were L'Estocq, Münnich, and Biron, Duke of Courland; abolished many of the oppressive police laws; abolished the secret office with its terrible system of espionage known under the name of word and deed; reduced taxation; initiated measures for the revival of Russian industries and commerce; and attempted

a reorganization of the army and navy. He also attempted to reconquer for the house of Holstein-Gottorp the portion of Schleswig which had been ceded to Denmark in 1713. Peter's pro-German tendencies, however, his liberal policy, his indifference to the Greek church, and his ill-concealed contempt for Russian manners and customs made him hated by his subjects. His wife had still deeper cause for dislike; for, though he was himself addicted to drunkenness and debauchery, he never ceased to reproach her with her infidelities, and had even planned to divorce her, disinherit her son Paul (q.v.), and elevate his mistress, Elizabeth Vorontsoff, to the throne. A formidable conspiracy, headed by Catharine and supported by the principal nobles, was formed against him. On the night of July 8, 1762, Peter was declared to have forfeited his crown, and his wife was proclaimed Empress as Catharine II by the guards, the clergy, and the nobility. Peter, who was then at Oranienbaum, neglecting the counsels of Field Marshal Münnich, who proposed to march at once on the capital at the head of the regiments which were still faithful, soon found even the opportunity of flight cut off, and was compelled to submit. He abdicated the throne on July 9, and on the 17th of the same month was put to death by Gregory Orloff to secure the safety of the conspirators. Consult R. N. Bain, *Peter III, Emperor of Russia* (London, 1902).

PETER I, KARAGEORGEVITCH (1846-). King of Servia. He was born at Belgrade in 1846. His grandfather was George Petrovitch, known as Kara (Black) or Czerny George (q.v.), who led the Servians in their struggle for independence against the Turks and in 1812 was recognized by the Sultan as Prince of Servia. Peter's father, Alexander, was elected Prince of Servia in 1842, to succeed Michael Obrenovitch, but in December, 1858, he was declared deposed by the National Assembly, and in the following month left the country. With him went Peter, who was put to school in Hungary, made frequent visits to Russia, and finally entered the French military school of Saint-Cyr. He was graduated there and became an officer in the French army. After the outbreak of the Franco-German war he served with distinction under Bourbaki, notably before Villersexel. Three times he was captured by the Germans and as often escaped. For several years he followed a life of extravagance and dissipation in Paris, and then, aroused by the troubles in the Balkans, actively encouraged the rising of 1875-76 in Herzegovina, which culminated in the Russo-Turkish War of 1877-78 and the complete establishment of Servian independence. After a period of roving he went to Montenegro and in August, 1883, married the Princess Zorka (born 1864), eldest daughter of Prince Nicholas. Eventually this marriage served to connect him with the Russian and Italian courts, since Zorka's sister Militza married the Grand Duke Peter Nikolaievitch and her sister Helena became the consort of Victor Emmanuel II. The permanent residence of Peter and Zorka was at Cetinje, but frequent visits to Paris were made. After Zorka's death (1890), Peter became estranged from his father-in-law and went to Geneva to educate there his three children, a girl aged five and two boys aged three and two. From that time until 1903, though a recognized pretender, he lived quietly in Switzerland. On June 11, 1903, King Alexander of Servia, of

the rival house of Obrenovitch (q.v.), and his Queen, Draga, were murdered, and four days later Peter was elected King of Servia by the Skupshtina. After an absence of 44 years he entered Belgrade on June 24 and on the following day took the oath of office. The accession of Peter had important international consequences, for, unlike his predecessor, he was opposed to Austro-Hungarian influences in his country and very favorable to Russia and to Pan Slavism. While loyally supporting constitutional government, he sympathized ardently with national aspirations for a greater Servia. Accordingly, he protested against the annexation of Bosnia-Herzegovina by Austria-Hungary in 1908 and against the action of the Dual Monarchy in depriving his country in 1912-13 of territory which was wrested from Turkey in the course of the Balkan War and which would have given Servia access to the Adriatic. From the resulting tension between Servia and Austria-Hungary proceeded the Great European War (1914 et seq.). In this war King Peter himself took the field with his army, just as did King Albert of Belgium. See **BALKAN WAR**; **SERVIA**; **WAR IN EUROPE**.

PETER, APOCALYPSE OF. See **APOCRYPHA, New Testament**.

PETER, EPISTLES OF. Two of the seven so-called Catholic Epistles of the New Testament.

1 Peter. This document, according to its address, signature, and closing paragraph (i. 1-3 and v. 12-14), is a letter from the Apostle Peter to the Christians of Asia Minor and sent thither by Silvanus, probably the Silas mentioned in Acts (xv. 22 et seq.). The Epistle was written to admonish and encourage those addressed to a cheerful, manly patience in persecution, to an orderly life, and to a steadfast hope. The doctrinal teachings are set forth incidentally to give the necessary foundation to the exhortations. The hortatory character of the Epistle makes it difficult to analyze satisfactorily. The following outline is suggested: after the usual address, signature, and salutation (i. 1-2), the author fervently expresses his praise to God for the Christian salvation, the object and end of their sorely tried faith, foreshadowed in prophecy and now eagerly awaited (i. 3-12). This prepares for the three series of exhortations that follow. In the first (i. 13-ii. 10) the readers are exhorted to earnestness, obedience, and holiness with godly fear in view of the cost of their redemption (i. 13-21), to the exercise of brotherly love, as all of one divine regeneration (i. 22-25), and to a vital union with Christ, the chief corner stone (ii. 1-10). The second series (ii. 11-iv. 11) urges to orderly life (ii. 11-12), to all due subjection to constituted authority, even if suffering should ensue, citing the example of such suffering set by Christ (ii. 13-25); then passes to exhort wives to reverence their husbands (iii. 1-7), adding a general exhortation to all to be orderly, forbearing, and forgiving (iii. 8-12). In case this loyalty involves suffering, let them remember Christ's vicarious suffering and its blessed results, conform their conduct to his, and place their faith in him, the risen Lord, especially since the end is near (iii. 13-iv. 11). The third set of exhortations (iv. 12-v. 11) pleads with those who are addressed not to take offense at the trials they are undergoing. If they are for loyalty to Christ, all is well. They must not suffer as evildoers (iv. 1-10).

The church officers and members are urged to faithful performance of duties (v. 1-7), and the final exhortation to watchfulness is followed by a benediction (v. 8-11). The Epistle closes with greetings from the church (or wife?) in Babylon and from Mark. A short benediction is added (v. 12-14).

The doctrinal teachings of 1 Peter, compared with those of the Pauline Epistles, are marked by a greater simplicity. They move within the sphere of Jewish-Christian thought and may be accounted for and explained on the basis of the application of the conviction that Jesus was the Messiah to the teachings of the Old Testament. The conception of God is that of the Old Testament, supplemented by the emphasis laid by Jesus on His Fatherhood (i. 3, 17). There is no distinctive Christology. Jesus is spoken of after the same manner as in the first chapters of Acts and in the Synoptic Gospels. The doctrine of redemption is fundamentally the same as that of Paul, but expressed differently, mainly in Old Testament language, and influenced largely by a deep appreciation of the human elements of Jesus' passion. The resurrection is the great fact that crowned the Messianic work of Jesus (i. 3, 11), and faith is fixed on that as well as on his death (iii. 22). The Christian life is founded on a vital union with the now living and glorified Jesus (i. 23-ii. 5). Salvation affects the real life, the soul (i. 9 et seq.), and begins here through the new birth by the agency of the Word (i. 23). It becomes a possibility through faith, a word of broad significance in 1 Peter, including the whole obedient response to the will of God expressed in the life and work of Jesus the Messiah. The positive teachings concerning salvation reveal strong convictions concerning sin and its seat in man's being. The eschatology of 1 Peter is simple. The future life is of far greater importance than this. We are only pilgrims here, and on that future we should fix our attention. It will be ushered in by a new revelation of Christ and will be an eternity full of glory (i. 7, 10; v. 10). The church organizations appear to have been still quite elementary. Elders are at the head and the younger element are urged to obey the older. As to baptism, not the form, but the heart condition is the important element (iii. 21).

The Epistle has been subjected to severe criticism. The central question is that of its genuineness. Is it what it purports to be? The external evidence in its favor is remarkably strong. All the prominent writers at the end of the second century, as well as Papias and Polycarp, early in the second century, used it as Peter's. No doubt as to its genuineness was expressed in the ancient Church.

The internal evidence in favor of Peter's authorship may be stated as follows: (1) The opening and closing sections, in which the writer calls himself the Apostle Peter, addresses a specific circle of Christian communities, mentions by name Silvanus, the writer (i.e., amanuensis), and probably also the bearer, and sends greetings from Mark. Both Silvanus and Mark were fellow workers with the Apostles and members of the primitive Christian community of Jerusalem. If these sections state the truth, the genuineness of the Epistle must be admitted. If they are to be rejected as fictitious, strong grounds must be given for the rejection. (2) Incidentally and without undue display the

writer represents himself as one who was an eyewitness of Jesus' ministry and passion (cf. i. 8, v. 1, and the warm-hearted way in which Jesus' sufferings are spoken of). (3) The independent character of the thought of the Epistle is, at least, not against its genuineness. The brief sketch of the teachings of the Epistle given above reveals this. While the writer comes close to Paul's language at times, he is no mere echo of Paul nor is he a blundering copyist. (4) There is a genuine and serious tone and purpose to the Epistle, exhorting its readers to all that is good, which makes it difficult to account for as a forgery.

The main objections to Petrine authorship based on internal evidence are: (1) The trials or persecutions referred to imply a date later than the end of Peter's life. In regard to this it may be said that the statements in the Epistle do not imply a regularly organized state persecution of Christians as such. The general opposition of the pagan world and of the Jewish element are sufficient to account for all that is said. That this opposition was severe in apostolic days the letters of Paul (cf. especially 2 Cor. xi. 23 ff.) and the record in Acts abundantly testify. It is not necessary to presuppose even the persecution of Nero as implied in the Epistle. Such a passage as ii. 13 et seq. does not point that way. (2) The Epistle is said to manifest great dependence on Paul's writings, which, it is thought, militates strongly against Petrine authorship. In regard to this it may be replied: (a) There is no inherent impossibility in the supposition that Peter may have known and valued Paul's writings and used expressions from them in a writing of his own. (b) It is probable that a linguistic relationship exists between our Epistle and Romans and Ephesians, but the exact nature of this relationship is not easy to determine. The similarities are not close enough to be called quotations. There is also the probability of a large stock of common phraseology current in early Christian circles, which, while it may well have had Paul as one of its chief sources, was not necessarily dependent on the reading of Paul's Epistles for its dissemination. (c) In any case the author of 1 Peter is master of his own thought and language. In this short Epistle he uses at least 60 words not found elsewhere in the New Testament, and gives to many common words a special, peculiar sense. (3) The Greek of 1 Peter is said to be of a quality far beyond the capability of Peter, an ignorant Galilean fisherman. But the fact is, we know nothing of Peter's knowledge of Greek. That language was largely spoken in Galilee, and Peter may have gained some proficiency in it. He seems, however, to have used Silvanus to write the Epistle, dictating the matter and leaving the writer to put it into finished form. This supposition, which has its support in the Epistle itself (cf. v. 12), may also go far towards solving the linguistic relation between 1 Peter and Paul's Epistles as Silvanus had been, for years previously, one of Paul's most intimate followers.

We may affirm, then, that the general character of the Epistle and its history in the Church are not opposed to its own claim to be an epistle of the Apostle Peter. It only remains to consider the questions of destination and date. The plain, literal sense of the words, "to the elect sojourners of the dispersion," etc., in-

dicates Jewish-Christian communities in the various provinces of Asia Minor as the parties addressed. The main objections to this view are that, according to Acts and Paul's Epistles, the Christianity of Asia Minor was overwhelmingly Gentile-Christian, and that no epistle addressed to Jewish-Christians would have used such language as we find in i. 18 and iv. 3-4. These objections are strong, though not conclusive. The work of Paul covered half of the territory indicated in the address, and many Jewish-Christian workers may have labored in north-eastern Asia Minor and even in the regions traversed by Paul. The second objection is more serious, but it cannot be said that Peter could not have used such language in addressing churches which, though composed mostly of Jewish Christians, still contained some converts from paganism.

It is better, however, to take the word "dispersion" in a figurative sense and consider that the Epistle was addressed to Christians as such, whether of Jewish or of pagan ancestry. In some parts of Asia Minor the former may have predominated; in other parts, especially in the western districts, the latter. It was only natural that the Apostle, himself a Jewish Christian whose experience had been mainly with Jewish Christians, should address them all as the true Israel. Since Paul had evangelized only a part of Asia Minor, an epistle addressed to churches scattered through the whole vast province had no occasion to mention him. It is probable that by Babylon (v. 13) Rome is intended. Whether the term "fellow elect" (fem.) means the church or some individual (the writer's wife?) is a question.

The date to be assigned to the Epistle depends mainly on the answers to two questions: (1) To what do the references to suffering point? If nothing less than a state persecution is implied, the time of the persecution by Nero is the earliest possible date—i.e., c.64 A.D. If no state persecution is implied, the Epistle may well have been earlier. (2) The question of the relation between 1 Peter and the Pauline Epistles. If 1 Peter has borrowed directly from Romans and Ephesians, it must be dated later than Ephesians, i.e., on the ordinary theory, later than about 60, when Paul was a prisoner in Rome. Most critics who hold to the genuineness of the Epistle and to its dependence on Paul are inclined to a date near 64 A.D. But if, as has been suggested above, the relation between 1 Peter and the Pauline Epistles is not such as to suggest direct borrowing, then no conclusions regarding the date of 1 Peter can be reached along this line. Ramsay (*The Church in the Roman Empire*, pp. 279-295, Oxford, 1893) advocates 80 A.D. Those who dispute Peter's authorship assign different later dates. The Epistle, if written at Rome, was, presumably, written when Peter was at Rome, and regarding this we have no certain information and here the case must rest for the present.

2 Peter. This Epistle purports to be from the Apostle Simon Peter to (an unnamed circle of) Christians. After exhorting them to fulfill their high destiny by a complete, well-developed Christian life (i. 3-11), he declares his purpose ever to remind them of these things, especially as he knows that his death is near, and is certain of the truth of the doctrines of the power and second coming of Christ (see **SECOND ADVENT OF CHRIST**), both from his own

experience at the Transfiguration and from the more sure word of prophecy (i. 12-21). He then passes to his main theme, warning against the threatened inroads of false teaching represented by bold, irreverent, reckless Antinomianism and by a skeptical denial of the second coming (ii. 1-iii. 13). The Epistle closes with a reference to Paul as teaching the same truths, though often misunderstood, and by an exhortation to constant Christian growth (iii. 14-18).

Unlike 1 Peter, this Epistle seems to have been called forth by some very urgent conditions in certain Christian communities. Its scope is not so broad nor its teachings so diversified as is the case with 1 Peter. Only in the very condensed passage i. 3-11 is a comparison between the two Epistles possible.

Because of its somewhat unique character, 2 Peter has proved an inviting field for biblical criticism, and the questions of its authorship, date, and destination are still open. The external attestation to the Epistle is probably weaker than in the case of any other New Testament writing. There is no distinct trace of its existence before Origen, though it is probable that it was commented on by Clement of Alexandria (c.190). We must then be content with such evidence as the Epistle itself offers. Petrine authorship is, without doubt, claimed, not only in the opening words, but in the reference to the Apostle's death as revealed by the Lord (i. 14), in the reference to the Transfiguration (i. 16), and in the notice of Paul's letters (iii. 15). Nevertheless grave objections may be made against this claim. For one thing, the implication in iii. 14 ff. that Paul's letters were already collected and of canonical (or at least semicanonical) standing makes a date within the limits of Peter's lifetime practically impossible in view of what we know of the history of the New Testament canon. Arguments drawn from the vocabulary and style of the Epistle are not of great weight, because of our imperfect knowledge of Peter's habits and circumstances. The remarkable, almost verbal similarity between 2 Peter ii. 1-iii. 3 and the short Epistle of Jude demands explanation. If, with most modern scholars, we hold that this section of the Epistle shows dependence on Jude, it becomes very difficult to maintain the apostolic authorship of 2 Peter, not only on general grounds, but also because the errorists combated are spoken of in Jude as already in the community, while in 2 Peter their appearance is still future, or at least indicated as very recent. The marked dissimilarity in many respects between 1 and 2 Peter is also a strong argument against identity of authorship. The relation between 2 Peter and apocryphal writings of Josephus is too uncertain for a basis of argument.

On the whole, it seems best to consider 2 Peter a pseudepigraph (like the so-called Gospel and Apocalypse of Peter), written "with a view of commending to the Christian reader views which he [the author] regarded as important and which he believed to be in accordance with St. Peter's teaching" (Mayor.)

Bibliography. The recent and able commentaries by Kühl, in Weiss's series (Göttingen, 1897), H. von Soden, in the Holtzmann Series (Leipzig, 1899), and Charles Bigg, in International Critical Commentary Series (New York, 1901), are full and leave little to be desired; also J. R. Lumby, "Epistles of St. Peter,"

in *Expositor's Bible* (ib., 1893), and J. H. Jowett, *Epistles of St. Peter* (ib., 1905). Chase, in the *Hastings' Dictionary of the Bible* (new ed., New York, 1909), gives an exhaustive treatment with a good bibliography. For the theology of 1 Peter, consult the standard New Testament theologies of Weiss, Beyschlag, Holtzmann, Stevens, and also Weiss, *Der petrinische Lehrbegriff* (Berlin, 1855). The various introductions to the New Testament, in particular the more recent ones of Theodor Zahn (Eng. trans., New York, 1909) and J. B. Moffatt (ib., 1911), and works on the apostolic age contain full discussions of the critical problems. For 2 Peter, consult also F. Spitta, *Der zweite Brief des Petrus und der Brief des Judas* (Halle, 1885), and especially J. B. Mayor, *The Epistle of St. Jude and the Second Epistle of St. Peter* (New York, 1907).

PETER, GOSPEL OF. See APOCRYPHA, *New Testament*.

PETER, pä'tër, HERMANN (1837-1914). A German classical scholar, son of K. L. Peter, best known for his work in Roman history. He was born at Meiningen, studied at Bonn and Breslau, and taught at Posen, Frankfort-on-the-Oder, and at Meissen, where he was rector of the school from 1874 to 1905. His works include important editions of *Scriptores Historiæ Augustæ* (1865; 2d ed., 1884) and critical essays on the same subject (1892); *Historicorum Romanorum Reliquiæ* (2 vols., 1870, 1906; vol. 1 in 2d ed., 1913); *Historicorum Romanorum Fragmenta* (1883), as well as Ovid's *Fasts* (1874; 3d ed., 1899); and the critical essays *Die Quellen Plutarchs in den Biographien der Römer* (1865) and *Die geschichtliche Litteratur über die römische Kaiserzeit bis Theodosius I. und ihre Quellen* (1897).

PETER, HUGH. See PETERS, HUGH.

PETER, PREACHING OF. See APOCRYPHA, *New Testament*.

PETER BELL. A tale in verse by William Wordsworth (1819), of exaggerated simplicity.

PETERBORO. A town in Hillsborough Co., N. H., 40 miles by rail southwest of Manchester, on the Boston and Maine Railroad (Map: New Hampshire, F 8). It contains a public library that was founded in 1833 and a historical society. A colony of art and music students has been established here and also a society of handicraft workers. There are cotton mills and basket factories. The water works are owned by the town. Pop., 1900, 2527, 1910, 2277.

PETERBORO MUSIC FESTIVAL. Shortly after the death of Edward MacDowell (q.v.) a number of admirers organized the MacDowell Memorial Association in 1908, and the composer's widow deeded to them the master's summer residence at Peterboro, N. H. At first rooms were rented for the summer, at very moderate rates, to composers who sought inspiration in the beautiful surroundings. This plan met with so much favor that soon the applicants could not be accommodated in the house and cottages began to be built. In 1910 Mrs. MacDowell conceived the idea of a pageant in memory of her husband. Prof. G. P. Baker of Harvard University superintended the scenic representation, while the arrangement of the music was in the hands of Chalmers Clifton. He selected appropriate music from the works of MacDowell and arranged the same for orchestra. The success of this pageant was so pronounced that it was decided to hold a similar festival an-

nually in the month of August. Each festival is of four days' duration, consisting of a pageant and a number of concerts. The vast majority of the works performed are by native composers, and not a few of the novelties are composed in the colony itself. From their beginning these festivals occupied a place of importance in the history of music festivals in the United States.

PETERBOROUGH. An episcopal city, a parliamentary and municipal borough, and a civic county, known as the soke or liberty of Peterborough, in Northamptonshire, England, on the Nene, 76 miles north by west of London (Map: England, F 4). Its principal edifice is the famous cathedral of St. Peter, which has undergone complete restoration since 1883 and holds a high rank among English cathedrals, exhibiting the eight grades of transitional architecture from Norman to Perpendicular. The south transeptal crypt incloses the site of the prior cruciform Saxon church. The west front as a portico is said to be the finest in Europe. A central tower, lantern-shaped, rises at the intersection of the nave and transept. The length of the cathedral is 476 feet; breadth at the great transepts, 203 feet; height of central tower from the ground, 150 feet. The town is regularly laid out, has an excellent endowed grammar school of the sixteenth century, a public library, a school of art, science, and technology, a college for training schoolmasters, a corn exchange in the Italian style, a jail and house of correction, a handsome parish church, and a number of charitable institutions. The city owns its water and electric-lighting works, markets, sewage farm, bathing place, and isolation hospital, maintains parks and recreation grounds, and provides cottage allotments. Peterborough is an important railway centre and carries on an active trade in corn, coal, timber, bricks, building stone, and malt. It has also manufactures of agricultural implements and extensive locomotive works and railway repair shops.

Anciently named Medeshamstede, the city had its origin in a great Benedictine monastery, founded in 655. This monastery, reared in honor of St. Peter, became one of the wealthiest and most important in England, but it was not until after being destroyed by the Danes in 807 and rebuilt about 966 that the town was called Peterborough. On the dissolution of the monasteries the magnificent cathedral was spared, owing, it is supposed, to its containing the remains of Queen Catharine of Aragon, but it was vandalized by Cromwell and his troopers in 1643. Pop., 1801, 3400; 1851, 8700; 1901, 30,872; 1911, 33,574. Consult: G. A. Poole, *Peterborough* (London, 1881); Davys, *The Cathedral and Abbey of Peterborough* (Peterborough, 1886); W. D. Sweeting, *Cathedral Church of Peterborough*, in Bell's "Cathedral Series" (London, 1899).

PETERBOROUGH. A city and the capital of Peterborough Co., Ontario, Canada, on both sides of the Otonabee River and on the Canadian Pacific and the Grand Trunk railroads and the Trent Canal, 76 miles northeast of Toronto (Map: Ontario, G 5). The town is the centre of a picturesque lake and river district and is a favorite resort for sportsmen. It is the seat of a Roman Catholic bishop. Besides the cathedral and several fine churches, the city possesses a provincial normal school, a collegiate institute, a public library, fine munic-

ipal buildings, and four parks. The hydraulic lift lock on the Trent Canal is one of the largest in the world, the height of lift being 65 feet, and the height of the guide towers being 100 feet from the foundation. The city is one of the largest Canadian centres of electrical development and has many manufacturing establishments, including lumber and flour mills, pork-packing plants, and manufactories of agricultural implements, harness, cereal foods, electric machinery and supplies, canoes, locks, shovels, clothing, carpets, tents and sails, dairy machinery, yarn, steel sashes, marble products, aerated waters, silk labels, furniture, bricks and tiles. Gold, silver, lead, mica, and iron are found in the vicinity. The value of the manufactured output in 1910 was \$10,633,119, as compared with \$3,789,164 in 1900, being an increase of 180.62 per cent. A United States consular agent resides here. The city owns its water works. Pop., 1901, 11,239; 1911, 18,360; 1915 (local est.), 23,500.

PETERBOROUGH, CHARLES MORDAUNT, third EARL OF (1658-1735). An English military and naval commander. He served as a boy in the navy and then entered the army. For the prominent part that he took against James II he was made Earl of Monmouth by William III, succeeding afterward to the earldom of Peterborough, as heir to his uncle, and was made Privy Councillor and First Lord of the Treasury, but his efforts to secure the passage of a bill providing for triennial parliaments led to a breach with the King, and in 1697 he was deprived of his offices and was for several months a prisoner in the Tower. During the War of the Spanish Succession the English expedition to the Iberian Peninsula was placed under his command, and in June, 1705, he arrived in Lisbon with 5000 Dutch and English soldiers. After taking on board the Archduke Charles of Austria, who claimed the Spanish crown, the armament proceeded to Valencia. Mordaunt conceived the idea of making a dash at Madrid and finishing the war at one blow, but was overruled by the Archduke and the Prince of Hesse and compelled to besiege Barcelona, which was defended on one side by the sea and on the other by the strong fortifications of Monjuich. By a coup de main he made himself master of Monjuich, Barcelona fell, and Mordaunt pushed his successes into the interior. Several towns submitted. He marched to Valencia and at the head of 1200 men defeated a Spanish force of 4000. The Spaniards sent a large army into Catalonia, and a French fleet appeared off Barcelona. Mordaunt returned to Barcelona, harassed the enemy's army, and, putting himself on board the English squadron, directed a movement which compelled the Frenchmen to put to sea, and Barcelona was saved. Mordaunt again wished to march towards Madrid, but his plan for gaining possession of the capital was once more rejected by Charles. He accordingly left the army in a fit of pique and went to Italy. In 1707 he returned to Valencia as a volunteer, but the excellent advice he gave was not followed. He was recalled to England, and from that moment the tide of fortune ran strong against the Austrian cause. On his return he made common cause with the Tories and received the Garter and other dignities for his services. On the accession of George I he received the appointment of commander in chief of the naval forces of Great Britain. He died

at Lisbon. Brilliant and versatile, he was also eccentric and erratic. His witty yet affectionate letters to Pope, Swift, Prior, etc., give a fine insight into his private character. His character has been sketched by Horace Walpole, in his *Catalogue of Royal and Noble Authors*, and with still greater force and picturesqueness by Macaulay. Attempts have been made to discount the brilliancy of his leadership in the Spanish campaign and to attribute the successes to other officers, but these have signally failed. Consult: George Warburton, *Memoirs of Charles Mordaunt, Earl of Peterborough and Monmouth* (London, 1853); F. S. Russell, *Memoir of Charles Mordaunt, Earl of Peterborough* (ib., 1887); William Stebbing, "Peterborough," in *English Men of Action* (ib., 1890); F. E. Cooper, "Peterborough," in Spenser Wilkinson's *From Cromwell to Wellington* (ib., 1899).

PETER CLAVER, SAINT (1580-1654). The apostle of the negroes in Spanish America. He was born in Catalonia of a noble family. After completing his education in the Jesuit college at Barcelona, he joined the novitiate of the society at Tarragona in 1602 and was sent to the newly founded college at Majorca. While he was still pursuing his studies, the general, Aquaviva, called for an approved missionary from each Spanish province of the society to go to the newly formed province of Granada in South America. Peter Claver was among those chosen and arrived at Cartagena, then the centre of the African slave trade, in 1610. In 1616 he was ordained and entered on his special work. He won the approval of the authorities for his plan and secured orders that no slave owners should be allowed to carry off the newly imported blacks until they had had instruction in the Christian faith. He signed himself the "slave of the negroes forever" and practically lived among them, on shipboard and in the hospitals, especially the leprosy hospital, ministering to their wants as well temporal as spiritual. His exertions during the plague in Cartagena resulted in utter exhaustion and paralysis, and he died Sept. 8, 1654. He was beatified by Pius IX in 1850 and canonized by Leo XIII in 1888. Consult P. B. G. Fleuriot, *Saint Pierre Claver, apôtre des nègres* (rev. ed., Paris, 1888), and F. Höver, *Der heilige Peter Claver, Apostel der Neger und Carthagenas* (Dülmen, 1888).

PETER DE KEMPENEER. See KEMPENEER, PETER DE.

PETER DE VINEA (c.1190-1249). An Italian statesman and jurist, born at Capua. By his abilities he attracted the attention of Emperor Frederick II, and as early as 1225 he appears as occupying a high judicial position in Frederick's Kingdom of Sicily. He soon became the chief judicial officer in the realm and aided in drawing up the constitution of 1231 for Sicily, which was far in advance of any other instrument of government of western Europe at that period. After filling other very high offices Peter was suddenly arrested on suspicion of having been bribed to poison the Emperor. It is said that, in order to avoid torture and further disgrace, he dashed out his brains against a pillar to which he had been chained. Dante has sought to clear his good name, and many beautiful legends arose concerning the tragic fate of the great statesman. His letters, poems, and speeches are some of the most useful sources for the history of his time. Con-

sult: J. L. A. Huillard-Bréholles, *Vie et correspondance de Pierre de la Vigne* (Paris, 1865); Salvatore Presta, *Pierre delle Vigne* (Milan, 1880); Copasso and Janelli, *Pietro della Vigna* (Caserta, 1882); Eduard Winkelmann, *Kaiser Friedrich II* (2 vols., Leipzig, 1889-97); Pasquale Villari, *Medieval Italy* (Eng. trans. by Costanza Hulton, London, 1910).

PETERHEAD. A seaport, a parliamentary, and municipal burgh of Aberdeenshire, Scotland, 44 miles northeast of Aberdeen (Map: Scotland, G 2). It is situated at the mouth of the Ugie River, on the most easterly point in Scotland. Keith Inch, the head of the peninsula and the nucleus of the town, occupied by fish-curing establishments, is now separated by a canal which connects the three spacious harbors of Peterhead, which have a combined area of 21 acres and two graving docks. The town is irregularly built, clean, and paved with the reddish granite named after the town. There is a parish church, a museum, and an art gallery. There are many churches, an academy and other schools, and libraries. The town owns its water supply, winter and summer baths, and a municipal lodging house. Formerly the chief British depot of the whale and seal industry, it is now noted for its herring fisheries, which employ over 500 boats and 5000 persons. The general trade is of considerable importance. The chief exports are herrings, cattle, agricultural produce, and granite. Carving and polishing granite, ship and boat building, woolen manufacture, and brewing are carried on. Peterhead dates from the thirteenth century. The Pretender landed here on Dec. 25, 1715. Pop., 1901, 11,750; 1911, 13,613.

PETERHOF, pā'tēr-hōf. A town in the Government of St. Petersburg, Russia, situated on the Gulf of Finland, 18 miles west of the capital (Map: Russia, C 3). It is a well-laid-out town, occupied chiefly by fine villas and summer residences, which extend along the gulf of Oranienbaum (q.v.) on the west and St. Petersburg on the east. The royal palace, with its extensive gardens, fountains, and statues modeled after those at Versailles, was begun by Peter I in 1711 and has since been greatly extended and embellished by the successive monarchs, especially by Elizabeth, Catharine II, and Nicholas I. It contains many rare works of art. Peterhof is now one of the most fashionable resorts around the capital, and the Russian court usually spends there a part of the summer. Pop., 1897, 11,300; 1911, 15,917.

PETERHOUSE. See ST. PETER'S COLLEGE.

PETER IB'BETSON. A novel by George Du Maurier (1891). It appeared serially in *Harper's Magazine* of that year.

PETER LOMBARD, or PETER THE LOMBARD (c.1100-c.84). An Italian theologian. He was probably born at Lumello in Lombardy. He studied at Bologna, Rheims, and later at Paris, where he was a pupil of Abélard. He became teacher of theology in the cathedral school of Notre Dame and in 1159 was appointed Bishop of Paris. He resigned the see after a year and died at Paris between 1160 and 1164. He was very generally styled Magister Sententiarum, or Master of the Sentences, from his compilation *Sententiarum Libri IV*, a collection of sentences from Augustine and other Fathers on points of Christian doctrine, with objections and replies also collected from authors of repute. It was

intended as a manual for the scholastic disputants of his age and as such was used for 500 years and made the basis of innumerable lectures and treatises. It was one of the first books printed, and many editions have been issued. It is found in Migne, *Pat. Lat.*, vols. exci-excii, with his *Catena* on the Psalms and on Paul's Epistles. Consult: Protois, *Pierre Lombard, son époque, sa vie, ses écrits, son influence* (Paris, 1881); J. Kögel, *Petrus Lombardus in seiner Stellung zur Philosophie des Mittelalters* (Leipzig, 1897); Adolf Harnack, *History of Doctrine*, vol. vi (Eng. trans. by Neil Buchanan, Boston, 1899); De Ghellinck, "The Book of Sentences," in *Dublin Review* (Dublin, 1910).

PETERLOO MASSACRE (fanciful name, suggested by *Waterloo*). The name popularly given to the dispersal of a large meeting by armed force in St. Peter's Field, Manchester, England, Monday, July 16, 1819. The assembly, consisting chiefly of bodies of operatives from different parts of Lancashire, was called to consider the question of parliamentary reform, and particularly to elect a representative in Parliament. The operatives had been drilling for some time prior to the meeting and assembled armed with sticks. The county magistrates resolved not to interfere until all were assembled and then to arrest the leaders. They had at hand six troops of the Fifteenth Hussars, several companies of infantry, and a small body of yeomanry, besides special constables. At the order of one of the magistrates the troops, supported by some of the yeomanry, charged and dispersed the mob, killing five or six and wounding a considerable number.

PETERMANN, pā'tēr-mān, AUGUST (1822-78). A German geographer. He was born at Bleicherode in Prussian Saxony and studied in Potsdam under Professor Berghaus in the geographical academy. There he worked upon Berghaus's *Physikalischer Atlas* and drew the map for Alexander von Humboldt's *Asie Centrale*. In 1845 he went to Edinburgh as assistant to A. K. Johnston in the preparation of his *Atlas of Physical Geography*, based upon the publication of Berghaus. In 1847 Petermann founded a cartographic establishment at London and was elected to the Royal Geographical Society. He then made a special study of the geography of Africa and of the Arctic Zone. In 1854 he returned to Germany to assume the directorship of Justus Perthes's geographic institution at Gotha and in 1855 founded the *Mitteilungen*, a monthly geographical journal, which remains the authoritative publication in its particular department. Like his father and his brother before him, he died by suicide.

PETERMANN, JULIUS HEINRICH (1801-76). A German Oriental scholar. He was born at Glauchau, was educated at Leipzig and Berlin, and studied Armenian at Venice. In 1837 he became professor of Oriental languages at the University of Berlin. From 1852 to 1855 he traveled through Asia Minor and Persia, in 1867-68 through Palestine and Syria; during the latter year he was German Consul at Jerusalem. Petermann published grammars of the Samaritan, Aramaic, and Armenian languages in the *Porta Linguarum Orientalium* series. Among his other works are *Reisen im Orient* (1860-61) and an edition of the *Samaritan Pentateuch* (1872 et seq.), continued after his death by Vollers.

PETER MARTYR. The name commonly given to **PIETRO MARTIRE DI ANGHIERA** (or **ANGHERA**) (c.1457-1526), an Italian writer on American history. He was born at Arona in northern Italy. In 1477 he went to Rome, where he secured the position of secretary to Francesco Negro, the Governor of the city, which he held until August, 1487, when he was induced to go to Spain by the retiring Spanish Ambassador, the Count of Tendilla. There he seems to have quickly become a chronicler, and in this capacity he came under the immediate protection of the Queen. In 1494 he was ordained as a priest and became tutor to the children of Ferdinand and Isabella. In 1501 he was entrusted with a diplomatic mission to the Sultan of Egypt, who had threatened to massacre all Christians in his domains in revenge for the expulsion of the Moors from Spain. Martyr's account of his successful visit to Cairo is narrated in his *Legatio Babylonica*, which he dedicated to Pope Leo X. In 1505 he also obtained the post of dean of the chapter of the cathedral of Granada, which he held until his death. In 1520 he was appointed royal chronicler and subsequently a member of the Council for the Indies. His principal works are the history of the New World, *De Rebus Oceanicis et Novo Orbe Decades*, and the *Opus Epistolarum*. The *Decades* constitute an important source for the early period of American discovery. The *Opus* is an invaluable collection of 816 letters dealing with contemporary events. Consult J. H. Mariéjol, *Un lettré italien à la cour d'Espagne, 1488-1526: Pierre Martyr d'Anghera, sa vie, ses œuvres* (Paris, 1888); J. Bernays, *Petrus Martyr Anglerius und sein Opus Epistolarum* (Strassburg, 1891); J. B. Thacher, *Christopher Columbus and Essay on Peter, Martyr of Anghera* (New York, 1903-04).

PETER MARTYR. A sixteenth-century religious reformer. See **VERMIGLI**.

PETER OF BLOIS, blwä (c.1135-c.1208). An English prelate and author, born at Blois of a Breton family, and well educated at Paris and Bologna. For two years he was tutor to William II of Sicily and keeper of the royal seal, and about 1173 entered the employ of Henry II of England, who sent him to Paris and to Rome. Peter became secretary to the Archbishop of Canterbury in 1176, a post he continued to hold under Baldwin, who succeeded to the see in 1184 and in whose behalf he was employed at Rome for a time. After the death of Henry II Peter acted (1191-95) as secretary to Queen Eleanor. He had been appointed archdeacon of London in 1192, and, if he be identified with the canon of Ripon bearing the same name, must have lived as late as 1208. He was a vain and ambitious man, well versed in Latin and a very able secretary, as he could dictate three letters and write a fourth himself simultaneously. Among his many works the *Epistles*, published in 1480 at Brussels, are the best.

PETER PAN. A play for children by Sir James M. Barrie (1904), produced in New York Nov. 6, 1905, with Maude Adams in the title rôle. The story appeared first in *The Little White Bird* (1902), also in *Peter Pan in Kensington Gardens* (1906) and in *Peter and Wendy* (1911).

PETERS, pät'sers, CARL (1856-). A German traveler. He was born at Neuhaus in Hanover, and studied at Göttingen, Tübingen, London, and Berlin, where in 1880 he became

privatdozent. In 1884 he founded the German Colonization Society, in whose interests he traveled through East Africa. Returning to Germany in 1885, he became the head of the German East African Company and two years later went again to Africa to assume the management of the colonial possessions. In 1888 he took the leadership of an expedition for the relief of Emin Pasha, marched up the Tana River to its source, and penetrated finally to the Victoria Nyanza. He crossed the lake in June, 1890, and met Emin, already rescued by Stanley. In February, 1891, he was sent as Imperial Commissioner to East Africa, founded a station at Kilimanjaro, and was active in the settlement of the boundary between German and English possessions. Accusations of cruelty towards the natives were in 1896 preferred against him. They were investigated before a judicial commission of the Reichstag and resulted in his dismissal. In 1898 he went to London and formed a company for the exploration of the gold fields of Rhodesia, and he himself revisited Africa in 1900 and again in 1905. In 1914 he returned to Berlin. He wrote: *Die deutsche Emin Pascha Expedition* (1891); *Das goldene Ophir Salomos* (1895), *Aequatorial- und Südafrika nach emer Darstellung von 1719* (1895), *Im Goldlande des Altertums* (1902, Eng. trans., *The Eldorado of the Ancients*, 1903), *England und die Engländer* (1904, 2d ed., 1905; Eng. trans., *England and the English*, 1904); *Die Gründung von Deutsch-Ostafrika* (1906); *Zur Weltpolitik* (1912).

PETERS, CHRISTIAN AUGUST FRIEDRICH (1806-80). A German astronomer, born in Hamburg. He studied at Königsberg, was employed in the Altona Observatory, and in 1839 was appointed assistant at Pulkova. Ten years after, Peters became professor at Königsberg and in 1854 was appointed director of the observatory at Altona and undertook the editorship of *Astronomische Nachrichten*. He went to Kiel in 1872, when the observatory was transferred thither, and in 1873 he was chosen professor of astronomy in the university of that place. His work was almost entirely on stellar astronomy and dealt especially with stellar parallaxes, the constant of nutation, and the study of Sirius. In addition to many papers contributed to the astronomical journals, he wrote also *Populare Mitteilungen aus dem Gebiet der Astronomie* (1860-69).

PETERS, CHRISTIAN HEINRICH FRIEDRICH (1813-90). A German-American astronomer, born at Koldenbüttel in Schleswig. He studied in Berlin, worked in the observatories of Copenhagen and Göttingen, then under Sartorius von Waltershausen in the survey of Etna, and in the topographic bureau of Naples, and in 1854 went to the United States. For several years he was employed on the coast survey and in 1858 was appointed professor of astronomy at Hamilton College and director of the Litchfield Observatory. His greatest services to astronomy were the discovery of about 50 comets and planetoids, and the stellar charts published in 1882. Peters led the United States expedition to New Zealand for the observation of the transit of Venus in 1874.

PETERS, or **PETER**, HUGH (1598-1660). An English Independent minister and author. He was educated at Cambridge, was ordained, and preached at the church of St. Sepulchre, London, until he was silenced for nonconfor-

mity; he went to Rotterdam and became pastor of the Independent church. He was in New England from the winter of 1635-36 to 1641; was settled pastor of the First Church in Salem, Mass., as successor of Roger Williams. As chaplain in the Parliamentary army he rendered unusual services, for which he was rewarded under the Commonwealth and the Protectorate. After the Restoration, being suspected of complicity in the King's death, he was indicted for high treason, condemned, and beheaded, Oct. 16, 1660. During his imprisonment he addressed to his daughter, Elizabeth, *A Dying Father's Last Legacy to an Only Child*. He published, among other works: *Peter's Last Report of the English Wars* (1646); *A Word for the Army and Two Words for the Kingdom* (1647); *Good Work for a Good Magistrate* (1651); and several other pamphlets. Consult J. B. Felt, *Memoir and Defense of Hugh Peters* (Boston, 1851).

PETERS, JOHN PUNNETT (1852-). An American Episcopal clergyman and Orientalist, born in New York City. He graduated at Yale (1873) and studied at Berlin and at Leipzig. He was professor of Old Testament languages and literature at the Protestant Episcopal Divinity School in Philadelphia (1884-91) and professor of Hebrew at the University of Pennsylvania (1885-93) and from 1888 to 1895 conducted excavations at Nippur. He became rector of St. Michael's Church, New York, in 1893, and from 1904 to 1910 he was also canon residentiary of the cathedral of St. John the Divine. He wrote, *Nippur, or Explorations and Adventures on the Euphrates* (2 vols., 1897); *The Old Testament and the New Scholarship* (1901); *Early Hebrew Story: Its Historical Background* (1904); *Annals of St. Michael's, New York, for One Hundred Years, 1807-1907* (1907); *Modern Christianity* (1909); *Jesus Christ and the Old Commandments* (1913); *The Religion of the Hebrews* (1914).

PETERS, MADISON CLINTON (1859-). An American clergyman, born in Lehigh Co., Pa. He was educated at Franklin and Marshall College, and at Heidelberg Theological Seminary, Tiffin, Ohio, whence he entered the ministry of the Reformed church in 1880. Between this year and 1907, when he gave up a denominational connection to become a "free" preacher, he was pastor of the following churches: First Presbyterian, Philadelphia; Bloomingdale Reformed, New York, Sumner Avenue Baptist, Brooklyn; Immanuel Baptist, Baltimore; and Epiphany (Episcopal), New York. He wrote: *Justice to the Jew* (1899; new ed. rev., 1910); *The Birds of the Bible* (1901); *Will the Coming Man Marry?* (1905); *Abraham Lincoln's Religion* (1909); *Haym Salomon* (1911); *The Mission of Masonry* (1913); *The Genius of the Jew* (1914).

PETERS, NORBERT (1863-). A German Catholic biblical scholar, born at Allendorf. He was educated at the universities of Münster, Bonn, Tübingen, and Würzburg and at the Eichstätt and Paderborn seminaries for priests. Ordained a priest in 1887, in 1892 he became professor of theology at Paderborn, where he was dean in 1898-99, 1904-05, and 1909-10. His name is intimately connected with modern Catholic criticism of the Old Testament, especially the Book of Ecclesiasticus, of which he edited the Hebrew text in 1902 with a German and in 1905 with a Latin version, and of which

he published a German translation with commentary in 1913. Among his other publications are: *Die Prophetie Obadias* (1892); *David's Jugend* (1899); *Beiträge zur Text- und Literaturkritik des Buchs Samuel* (1899); *Bibel und Naturwissenschaft* (1906); *Katholische Kirche und Bibellessen* (1908); *Die Religion des Alten Testaments* (1911); *Der Text des Alten Testaments und seine Geschichte* (1912); *Der Krieg des Herrn* (1914).

PETERS, PHILLIS. See WHEATLEY, PHILLIS.

PETERS, RICHARD (1744-1828). An American jurist, born in Belmont, Pa. (now part of Philadelphia). He graduated at Philadelphia College (now University of Philadelphia) in 1761, studied law, and soon rose to eminence at the bar. During the Revolutionary War he was captain of a militia company in 1775-76, was secretary of the Board of War from 1776 to 1781, and was instrumental in having Benedict Arnold tried before a court-martial in January, 1780. He was a member of Congress in 1782-83, sat in the State Assembly in 1787-91, and was a United States district judge from 1792 to 1828. He was one of the founders of the Philadelphia Agricultural Society and its president for more than 30 years and in 1797 demonstrated by a series of experiments the agricultural value of gypsum. He published *Admiralty Decisions in the United States District Court of Pennsylvania* (2 vols., 1807).—His son, **RICHARD PETERS, JR.** (1780-1848), was successor of Henry Wheaton as reporter of the United States Superior Court and published *Reports of the United States Circuit Court, 1803-18* (1819); *Reports of the United States Supreme Court, 1828-43* (17 vols., 1828-43); *Condensed Reports of Cases in the United States Supreme Court from its Organization till 1827* (6 vols., 1835). He was also editor of *Chitty on Bills*; *Bushrod Washington's Circuit Court Reports, Third Circuit* (4 vols., 1803-27), and of the *United States Statutes at Large*.

PETERS, SAMUEL (1735-1826). An American clergyman, the author of a well-known history of Connecticut. He was born at Hebron, Conn., Dec. 12, 1735, graduated at Yale in 1757, and in 1759 was ordained in London as a minister of the Church of England. Returning to Connecticut in 1760, he was placed in charge of the churches of Hebron and Hartford. In the pre-Revolutionary controversies he embraced the Tory cause and was so pronounced in his loyalty to the crown that in 1774 he was forced by the Sons of Liberty to abandon the Colony and take refuge in England. Here in 1781 he published anonymously his celebrated *General History of Connecticut, from its First Settlement under General Fennycok, Esq., to its Latest Period of Amity with Great Britain* (republished in New York, 1877), in which he gave a code of so-called "blue laws" which attracted widespread attention. These laws were formerly supposed to have been pure forgeries and fabrications, but recent investigations have shown them to have been taken in part from an earlier writer (Neal) and in part (with modifications) from actual laws, only two or three of the 45 apparently having been invented out of hand. More than one-half really existed in New Haven, and more than four-fifths existed in some form in the New England Colonies. The most extreme (and most quoted) of these laws were never in force in Connecticut. In 1794 Peters was chosen Bishop of Vermont, but was never consecrated.

In 1805 Peters came to New York. In 1817 he visited the Falls of St. Anthony, taking up a large claim there, but again settled in New York (1818) and died there in great poverty April 19, 1828. He published a number of books and pamphlets, characterized by a slovenly and uncritical scholarship and by a general uniformity of misstatement and reckless assertion. Consult: Trumbull, *The Rev. Samuel Peters: His Defenders and Apologists* (Hartford, 1877); id., *The True Blue Laws of Connecticut and New Haven* (ib., 1876); "Examination of Peters's Blue Laws," by Prince, in *Annual Report of the American Historical Association* for 1898.

PETERS, WILLIAM JOHN (1863-). An American scientist and Arctic explorer, born at Oakland, Cal., and educated at the University of California. As topographer of the United States Geological Survey (1884-1902) he was engaged in topographic and triangulation work in the United States and in Alaska. From 1903 to 1905 he was chief of the scientific force of the Ziegler polar expedition to Franz Josef Archipelago and as chief magnetic observer and commander of the Carnegie Institution yachts *Galilee* and *Carnegie* he made (1906-14) a magnetic survey of the oceans of the world. He commanded a magnetic expedition to the Hudson Bay region in 1914. His principal published works are discussions of the magnetic, meteorological, and tidal observation in Franz Josef Archipelago (*Ziegler Polar Expedition*, 1907); and, as assistant to and collaborator with Prof. L. A. Bauer, "Magnetic Declinations and Chart Corrections Obtained by the Carnegie" (*Terrestrial Magazine*, vols. xv-xix).

PETERSBURG. An incorporated town, of about 1000 inhabitants, on Mitkof Island, Alaska (Map: Alaska, N 7). It is the centre of a large and lucrative halibut trade and produces much lumber.

PETERSBURG. A city and the county seat of Menard Co., Ill., 21 miles by rail northwest of Springfield, on the Sangamon River and at the junction of the Chicago, Peoria, and St. Louis and the Chicago and Alton railroads (Map: Illinois, E 6). The city contains a Carnegie library, a high school, and a monument to General Stephenson, founder of the G. A. R. It is surrounded by a farming and stock-raising district, having deposits of coal. There are several coal mines and various manufactories, including flour mills, a canning factory, brick and tile plant, etc. The water works are owned by the municipality. Pop., 1900, 2807; 1910, 2587.

PETERSBURG. A town and the county seat of Pike Co., Ind., 40 miles north by east of Evansville, on the Chicago and Eastern Illinois Railroad (Map: Indiana, C 7). Interesting features are the Thornton's Home for Orphan Children and Old Indian Fort, built in 1807. The town has manufactures of flour, brick and tile, lumber, etc., and considerable trade in coal, which is mined extensively in the vicinity. Agriculture and stock raising also are important industries in the fertile region adjacent. Natural gas and oil are found near by. The water works are owned by the municipality. Pop., 1900, 1751; 1910, 2170.

PETERSBURG. A city, independent of county authority, at the junction of Chesterfield, Dinwiddie, and Prince George counties, Va., 23 miles south of Richmond, at the head

of navigation, on the Appomattox River and the upper Appomattox Canal and on the Norfolk and Western, the Atlantic Coast Line, and the Seaboard Air Line railroads (Map: Virginia, G 4). There are two steel bridges across the river and two public parks. Petersburg is the seat of the State Central Hospital for the Insane, with 1000 colored patients, the Virginia Normal and Industrial Institute, for the higher education of colored students of both sexes, and Southern Female College. It has a Benevolent Mechanics Association, with a library and museum. There are also the Young Men's Christian Association, the Home for the Sick, and fine Masonic, Odd Fellows', and Red Men's buildings. Petersburg carries on an extensive trade in tobacco, lumber, and peanuts, and is an important industrial centre, its manufacturing interests being promoted by excellent water power. The value of exports from the port of Petersburg amounted in 1914 to \$4,746,677, while importations were valued at \$813,531. The products of the principal industries are cotton, tobacco, machinery, trunks, clothing, silk and knit goods. The government is vested in a mayor, elected every four years, and a board of aldermen which controls elections of all officials governing the administrative departments. The water works are owned and operated by the municipality. Pop., 1900, 21,810; 1910, 24,127; 1914 (U. S. est.), 25,112.

Petersburg was founded in 1733 on the site of an Appomattox Indian village destroyed in 1676 by Nathaniel Bacon, was incorporated as a town in 1748, and was chartered as a city in 1850. During the Revolution it was twice occupied by the British under General Philips, and in the War of 1812 the Petersburg volunteers served with conspicuous gallantry. Being a great railway centre of supply from the south, Petersburg was the scene of much of the fighting in the Virginia campaign of 1864-65. (See CIVIL WAR IN AMERICA.) After his disastrous failure at Cold Harbor June 3, 1864 (q.v.), Grant marched his army of more than 100,000 men to the James River, with the idea in part of taking Petersburg and thus of forcing the evacuation of Richmond. General Butler, at Bermuda Hundred, was hastily reinforced by a corps under Gen. W. F. Smith, and was ordered to attack Petersburg, then defended by only 2500 Confederates. But, though his force numbered 16,000, he carried out his orders (June 15) half-heartedly and inefficiently and thus allowed Confederate reinforcements to be thrown into the city. Grant, arriving on June 16, made bloody but unsuccessful assaults on the 16th, 17th, and 18th, his losses for the three days being fully 10,000. He then settled down for a siege. On July 30 the famous Petersburg mine—a shaft 520 feet long with lateral branches (near the end) extending 40 feet on each side—was exploded with terrific effect, a Confederate regiment being destroyed and a huge crater produced, through which an inefficiently commanded force of Federals tried to fight its way. The Confederates quickly recovered, poured a deadly artillery fire into the crater, and the Federals were forced back with a loss of more than 4000. Lee repeatedly foiled the manoeuvres of Grant, but finally, on April 2, 1865, after the disaster at Five Forks, was compelled to evacuate both Petersburg and Richmond. Consult Humphrey, *The Virginia Campaign of 1864 and 1865* (New York, 1893).

PETER SCHLEMIHL, pā'tēr shlä'mēl. A widely popular tale by Chamisso (1813), relating the adventures of a man who sells his shadow to the Evil One in return for an inexhaustible magic purse.

PETERSEN, pā'tēr-sen, EUGEN (1836-). A German archaeologist, born at Heiligenhafen in Holstein. He studied at Kiel and Bonn, in 1873 was appointed professor of archaeology at Dorpat and in 1879 at Prague. He was a member of the Austrian archaeological expeditions to Greece in 1880 and to Asia Minor in 1882-85. In 1886, after removing to Berlin, Petersen was sent to Athens as secretary of the German Archaeological School, and from 1887 to 1905 he occupied a corresponding post in the German School at Rome. He edited Theophrastus' *Characters* (1859) and wrote: *Die Kunst des Pheidias am Parthenon und zu Olympia* (1873); *Reisen in Lykien* (1889), with others; *Städte Pamphyliens und Pisidiens* (1890-92), with Niemann and Count Lanckoronski; *Vom alten Rom* (1898; 2d ed., 1900); *Trojans dakische Kriege nach Säulenrelief* (1899 et seq.); *Die Skulpturen des vatikanischen Museums* (vol. i, 1903), with W. Ameling; *Comitum, Rostra, Grab des Romulus* (Rome, 1904); etc.

PETERSEN, JOHANN WILHELM (1649-1727). A Lutheran mystic. He was born at Osnabrück, taught at Rostock and Giessen, when he came under the influence of Spener (q.v.) and the Pietists, and preached acceptably at Hanover. In 1678 he became superintendent of Lübeck. Ten years later he was chosen to a similar position at Lüneburg, but his millenarian views led to his summary removal and banishment in 1692. He went to Magdeburg and spent the rest of his life preparing pamphlets and treatises explaining and defending his views. Petersen was the leading Lutheran mystic and pre-millenarian of the seventeenth century. He was entirely orthodox and conventional except upon a few points, such as the thousand years' reign of Christ upon earth and the apocatastasis, or doctrine of universal restoration. Petersen wrote his autobiography, *Lebensbeschreibung* (2d ed., Frankfurt, 1719). One of his treatises, *Die Stimmen aus Zion*, appeared in Ebenezer, N. Y. (1851-52). Consult his *Life* by Kirschner (Eutin, 1862) and A. Ritschl, *Geschichte des Pietismus* (Bonn, 1884).

PETERSEN, NIELS MATTHIAS (1791-1862). A Danish scholar and historian of literature, born at Sanderum, on Fünen. He was appointed professor in the Normal School of Brahamtölleborg, was employed in the state archives, and in 1845 was chosen professor of Scandinavian languages in the University of Copenhagen. Petersen wrote on mythology, history, geography, and above all on literary history. His most important works are *Bidrag til den old Nordiske Literaturs Historie* (1866) and *Bidrag til den Danske Literaturs Historie* (5 vols., 1853-61; 2d ed., 1867-71), a valuable work which stops with the beginning of the nineteenth century.

PETER SIMPLE. A novel by Captain Marryat (1834). This rollicking sea tale gives the adventures of a midshipman on a man-of-war.

PETERSON, FREDERICK (1859-). An American neurologist and alienist, born at Fari-bault, Minn. In 1879 he was graduated from the medical department of the University of Buffalo. After several years in Europe he be-

came, in 1882, professor of general pathology and director of the laboratory of the University of Buffalo. In 1888 he established himself in New York City as a specialist in nervous and mental troubles. In 1893-94 he was professor of neurology at the University of Vermont. For several years he was professor of neurology in the Women's Medical College (New York) and he served as chief of clinic in the Department of Nervous Diseases, Columbia University until 1903, when he was appointed professor of psychiatry. He was president of the New York State Commission in Lunacy 1900-04. For many years he was an editor of the *American Medico-Surgical Bulletin*. Besides writing numerous monographs he contributed to Church and Peterson's *Nervous and Mental Diseases* (1899; 8th ed., 1914) and wrote *American Textbook of Legal Medicine and Toxicology* (1903). He is also the author of *Poems and Swedish Translations* (1883); *In the Shade of Yggdrasil* (1893); *A Song of the Latter Day* (1904).

PETERSON, SIR WILLIAM (1856-). A Canadian educator and classical scholar, born in Edinburgh, Scotland, and educated at Edinburgh University, Corpus Christi College, Oxford, and Göttingen University, Germany. He was assistant professor of humanity, Edinburgh University (1879-82); principal of University College, Dundee (1882-95); and thereafter principal of McGill University, Montreal. Peterson was elected a vice president of the Archaeological Institute of America and in 1910 became chairman of the board of trustees of the Carnegie Foundation for the Advancement of Teaching. He was made C.M.G. in 1901 and K.C.M.G. in 1915. Peterson edited and annotated: *Quintilian's Institutes of Oratory* (1891); *The Dialogues of Tacitus* (1893); *The Speech of Cicero for Cluentius* (1895); *The Cluni MS. of Cicero* (1901); *Cicero's Verrine Orations* (1907); *Cicero's Post Reditu Orations* (1910). In 1915 he published *Canadian Essays and Addresses*.

PETER'S PENCE. The name given to offerings made for the support of the Pope, called in early English Romefoh or Romescot. As a definite historical tribute it seems to have had its origin in England, from which it spread to Denmark and Norway under Canute. The origin of the payment has been attributed to Ina, King of the West Saxons, and by others to Offa and to Ethelwulf; but the question is still obscure. It was collected annually in the month of July, or between the feasts of Sts Peter and Paul and of St Peter's chains. It consisted in the payment of a silver penny by every family that possessed land or cattle of the yearly value of 30 pence. The payment was finally abolished under Henry VIII, and in other countries it did not survive the Reformation. Latterly the name has been often applied to the voluntary offerings for the support of the holy see made by its subjects in all parts of the world, since the loss of its territorial possessions has made other support necessary. The seventh Provincial Council, Baltimore, 1849, approved the custom for Catholics in the United States. Consult: A. M. von Steinle, *Die Peterspfennig* (Frankfurt, 1893) O. Jensen, in the *Transactions of the Royal Historical Society*, n. s., vols. xv, xix (London 1901, 1906); id., *Die englische Peterspfennig* (Heidelberg, 1903); Leopold von Ranke, *Hu*

tory of the Popes, vol. i (Eng. trans. by Foster, London, 1908).

PETERSEN, pã'ters-sen, (HJALMAR) EILIF (EMANUEL) (1852-). A Norwegian landscape, historical, and genre painter, born in Christiania. He studied at Karlsruhe and in Munich under Lindenschmit, and first painted historical episodes such as "Christian II Signing a Death Warrant" (1876, Breslau Museum); then religious subjects, in which he was influenced by the Venetians, whom he studied in Italy. The best example in this kind is "The Ascension," in Ulleren Church. It was in Italy that he emancipated himself from the old Munich traditions; on returning home in 1883 he became known as one of the greatest Norwegian plein-air painters. His genre scenes and landscapes are sometimes full of dazzling color, as in "Piazza Montanara" (1882) and "The Laundresses" (1889), or delicately harmonious, as in "The Woodland Lake" (1891), "Summer Night" (Munich Pinakothek), "Gajamars Song" (1904-07).

PETER THE CRUEL, King of Castile. See PEDRO THE CRUEL.

PETER THE HERMIT, or PETER OF AMIENS (c.1050-1115). The preacher of the First Crusade. He was born in the city or at least in the diocese of Amiens about 1050. The stories told of his early life, that he was a soldier, married, and had several children, are fictitious. It is believed that he undertook a pilgrimage to the Holy Land but did not reach Jerusalem. Legend told of a visit to Jerusalem and a divine commission in a dream, a story which first appears in William of Tyre. It is doubtful whether he was the originator of the Crusade in any real sense. After the Council of Clermont in 1095 (see CRUSADE; URBAN II) Peter appeared as a preacher of the Crusade in northern and central France. He rode on a mule, with a crucifix in his hand, his head and feet bare; his dress was a long robe and a hermit's cloak of the coarsest stuff, girt with a cord. He preached with the greatest earnestness in the pulpits, on the roads, and in the market places, everywhere arousing his hearers to a high pitch of enthusiasm, and was honored as a saint inspired from heaven. As early as April, 1096, Peter reached Cologne with a following of 15,000 men, and there his army received an accession of 15,000 more. They were mostly from the lower classes, poorly organized, and little fitted for war or the hardships before them. In disorderly bands they made their way through Germany and Hungary towards Constantinople. (See CRUSADE.) Peter himself reached the city in July and accompanied his army across the Bosphorus. But, disgusted by the insubordination of his followers, he returned to Constantinople and gave up the attempt to act as leader. During the siege of Antioch in 1098 he made a cowardly attempt to run away, but nevertheless was soon after that trusted with a difficult commission to Kerbuga, King of Mosul, and acquitted himself with credit. During the winter of 1098-99, when many wished to abandon the Crusade, Peter appeared in his old rôle of preacher, urging its continuance. He tried to defend the poor against the selfishness of the leaders. On July 8, 1099, he preached on the Mount of Olives. After the capture of Jerusalem (July 15, 1099) he remained in the city, while the army proceeded towards Egypt. He returned home, probably shortly after the battle of Asca-

lon, and became monk and prior at Neufmoustier, near Huy, in the diocese of Liège, where he died July 8, 1115.

Bibliography. P. d'Oultreman, *La vie du vénérable Pierre l'Ermitte* (Mons, 1612; reprinted at Clermont, 1895), containing the traditional view; Heinrich Hagemeyer, *Peter der Eremit* (Leipzig, 1879); Franz, *Peter von Amiens* (Hofgeismar, 1891); Donnet, *Pierre l'Hermitte* (Antwerp, 1893); Philip Schaff, *History of the Christian Church*, vol. i (New York, 1899); D. A. Goodsell, *Peter the Hermit* (ib., 1906); *Pierre l'Ermitte's Mighty Friend*, translated by John Hannon (ib., 1912); also general histories of the Crusades.

PETER THE VENERABLE, or PETER OF MONTBOISSIER (c.1092-1156). Abbot of Cluny. He was born at Montboissier, was educated in a Cistercian monastery, took the monastic vows in Cluny (1111), and was chosen prior of the famous monastery there when only 30 years old. He cultivated learning and piety and exemplified both in his own life. He visited England and Spain and was in the Council of Pisa (1134). It is related that he reconciled the kings of Castile and Aragon and that he advocated the claim of Innocent II to the Papal throne and secured his general acceptance by the Church. He also befriended Abélard, and gave him a refuge in the monastery of Cluny for the close of his troubled life. Peter died at Cluny, Dec. 25, 1156. Three of his treatises deserve separate mention: (1) *Against the Jews*; (2) *Two Books of Famous Miracles* (French trans. by d'Avenel, Paris, 1874); (3) *Against the execrable Sect of the Saracens*. In the last-named work he shows considerable knowledge of his subject; he had a condensed Latin translation of the Koran made by his secretary, Peter of Poitiers, which was long the only one extant; it was edited by Bibliander and published at Basel in 1543. Unfortunately only two of the five books of this treatise are extant. He also wrote against the Petrobrusians. (See BRUYS, PIERRE DE.) Peter's letters are important for the history of the period. His writings, with a *Life* by Rodolphus, are collected in Migne, *Patrologia Latina*, clxxxix. Consult: C. A. Wilkens, *Petrus der Ehrwürdige* (Leipzig, 1857); J. d'Avenel, *Vie de Pierre le Vénérable* (Paris, 1874); Demimuid, *Pierre le Vénérable, ou la vie et l'influence monastique au douzième siècle* (new ed., ib., 1895).

PETERWARDEIN, pã'tër-vãr-din' (Hung. *Pétervárad*). A free town and strong fortress in the County of Syrmien, Croatia and Slavonia, Hungary, situated on a promontory on the right bank of the Danube opposite Neusatz, with which town it is connected by two bridges. The fortifications are situated at the base of a high rock and on its summit overlooking the plain. The trade is chiefly in grain, wine, and fruit. Pop., 1900, 5019; 1910, 5727. Peterwardein is believed to occupy the site of the Roman Acumincum. The fortress was captured by the Turks in 1526 and was the scene of the defeat of the Grand Vizier Ali by Prince Eugene of Savoy in 1716, after which it was awarded to the Emperor by the Peace of Passarowitz in 1718.

PETHICK LAWRENCE, FREDERICK WILLIAM and EMMELINE. See LAWRENCE.

PETIGRU, JAMES LOUIS (1789-1863). An American jurist, born in Abbeville District, S. C. He graduated at the College of South

Carolina in 1809 and taught until his admission to the bar in 1812. He began practice in this district, volunteered for the defense of Port Royal against a threatened British attack in 1813, and soon afterward was elected solicitor of the district. In 1819 he accepted an advantageous partnership in Charleston, and was elected Attorney-General of the State in 1822. When the issue of nullification (q.v.) was presented he opposed it with courage under difficult circumstances, became prominent in the Union party, and resigned his office in 1830 to become a candidate for the State Senate. He was defeated, and incurred much unpopularity. From 1850 to 1853 he was United States district attorney, and later was selected to codify the laws of South Carolina, which task was finished in 1862. He vigorously opposed secession, but preserved the respect of his fellow citizens. His bust was placed in the city hall of Charleston in 1883. Consult W. J. Grayson, *James Louis Petigru* (New York, 1866).

PETIOLE (from Lat. *petiolus*, stalk or stem of fruits, irregular dim. of *pes*, foot). The stalklike portion of a leaf (q.v.).

PÉTION, pá'syón', ALEXANDRE SABES (1770-1818). A Haitian general and politician, born at Port-au-Prince, the son of a white father and a mulatto mother. He received a good education and fought for his country's independence under Toussaint L'Ouverture. Later he joined General Rigaud against L'Ouverture, went to France in 1800, and returned in 1802 with General Leclerc. He subsequently served under Dessalines (q.v.) against the French. Upon the death of Dessalines and the succession of Christophe (q.v.) the southern part of the island set up an independent republic and Pétion, who was Governor of Port-au-Prince, was chosen President in 1807. There followed a civil war with Christophe, which desolated the country for many years. Pétion remained at the head of the government in the southern part of the island until his death. While in power Pétion displayed an amount of moderation strange in a Haitian politician. He protected the foreigners in the country and made some attempts to preserve the national credit. A sketch of his military and political career is given in St. John, *Hayti*; or, *The Black Republic* (London, 1884).

PÉTION DE VILLENEUVE, de vél'něv', JÉRÔME (1756-94). A French revolutionist. He was the son of a procurator at Chartres and was practicing as an advocate and writing revolutionary essays in his native city when he was elected in 1789 a deputy to the States-General. He became a prominent member of the Jacobin Club and an ally of Robespierre. He was sent as one of three commissioners to bring back the royal family from Varennes after their attempted flight, and in the execution of this commission he acted in a harsh and unfeeling manner. In November, 1791, he was elected mayor of Paris to replace Bailly. He became a member of the Convention and on Sept. 20, 1792, its first president. He favored the Girondists, and although at the trial of the King he voted for his death, he was suspected of being a Royalist and of complicity in the treason of Dumouriez. He was thrown into prison, June 2, 1793, on the fall of the Gironde, but escaped and joined the other Girondists at Caen. In company with Buzot he reached the neighborhood of Bordeaux. A short time after their dead

bodies were found in a field near Saint-Emilion, and they were supposed to have committed suicide. The public career of Pétion shows him to have been weak, shallow, ostentatious, and vain. The *Œuvres de Pétion*, containing his speeches and some small political treatises, were published at Paris in four volumes (1793). Consult his *Mémoires inédites*, edited by Dauban (Paris, 1866); Vatel, *Charlotte Corday et les Girondins* (ib., 1872); F. A. Aulard, *Les orateurs de la Constituante* (ib., 1882). See FRENCH REVOLUTION.

PETIT, pe-tě', EDOUARD (1858-). A French educator, born at Marseilles. He was educated at the lycée of Marseilles and at the Collège Rollin and became a doctor of letters. Subsequently he taught at the Collège Rollin and at the lycées of Nîmes and Janson-de-Sailly. In 1894 he began the organization of popular education and became Inspector General of Public Instruction. Petit was made a Knight of the Legion of Honor. His writings include: *Francis Garnier* (1885); *Lectures tirées d'auteurs modernes* (1887); *François Mignet* (1889); *Autour de l'école* (1890); *L'Ecole moderne* (1891); *De l'école au régiment* (1895); *L'Ecole de demain* (1902); *Jean Laveur* (1905); *La vie scolaire* (1907); *Autour de l'éducation populaire* (1908); *La commune et la mutualité scolaire* (1909); *Eugène Pelletan: sa vie, son œuvre* (1913); *Histoire illustrée des pays et des peuples* (1913).

PETIT DE JULLEVILLE, pe-tě' de zhul'-vèl', LOUIS (1841-1900). A French scholar and literary critic, born in Paris. From the Ecole Normale (1860-63) he went to the French School in Athens, was made doctor of letters in 1868, and, after teaching rhetoric in the Collège Stanislaus, Paris, removed to Dijon. Thence he returned to Paris, where he became professor of French mediæval literature and of the history of the French language in the Faculty of Letters (1886). Three of his works were crowned by the Academy. Besides textbooks on his subject he published: *Histoire de la Grèce sous la domination romaine* (1875); *Histoire du théâtre en France. Les mystères* (1880); *Les comédiens au moyen âge* (1885); *La comédie et les mœurs en France au moyen âge* (1888); *Le théâtre en France* (1889). He was general editor of a *Histoire de la langue et de la littérature française* (8 vols., 1896-1900). To this work he contributed several valuable articles.

PETIT GRAIN, pét'í grân'; Fr. pron. pe-tě'-grân', OIL OF. See ORANGE OIL.

PETITION (Lat. *petitio*, from *petere*, to seek; connected with Gk. *néreōbai*, *petesthai*, Skt. *pat*, to fly). A supplication preferred to one capable of granting it. The right of a British subject to petition the sovereign or either House of Parliament for redress of grievances is a fundamental principle of the English constitution and has been exercised from very early times. The right was so generally exercised in the time of Edward I and Edward II that it became necessary to formulate rules and methods by which the task of hearing petitions could be facilitated. Those which could not be answered without special reference to the King formed a special branch of business, and it was from the share of the Chancellor in examining and reporting on petitions for clemency and favor that his equitable jurisdiction grew up in the fourteenth century. The nomination of receivers and triers of petitions became a

part of the opening business of every Parliament, and proclamation was made inviting all persons to resort to the receivers. The receivers were clerks or masters in chancery; the triers were selected by the King from the Lords, spiritual and temporal, and from the justices. The triers could call to their assistance the Chancellor, Treasurer, Steward, and Chamberlain. After examining into the nature of the grievances for which redress was sought, they referred the petitions to certain of the courts or to Parliament for further action.

In the time of Richard II the work of receiving and hearing petitions was divided into three parts—one part for the consideration of the King, one for the Council, and one for Parliament. The increasing power of the Commons over taxes and expenditures vastly argued the importance of the right of petition to the crown. In the fourteenth century they began the policy of accompanying their grants with petitions for redress in the name of the whole community. Later the petition for redress preceded the grant, and the latter was made conditional upon the promise of the King to provide the desired relief.

Since the revolution of 1688 the practice has been gradually introduced of petitioning Parliament, not so much for the redress of specific grievances as regarding general questions of public policy. Petitions must be in proper form and respectful in language; and there are cases where petitions to the House of Commons will only be received if recommended by the crown. A petition must, in ordinary cases, be presented by a member of the House to which it is addressed; but petitions from the Corporation of London may be presented by the sheriffs or Lord Mayor. Petitions from the Corporation of Dublin have also been allowed to be presented by the Lord Mayor of that city.

The practice of the House of Lords is to allow a petition to be made the subject of a debate when it is presented; and unless a debate has arisen on it, no public record is kept of its substance or of the parties by whom it is signed. In the House of Commons petitions not relating to matters of urgency are referred to the Committee on Public Petitions, and in certain cases ordered to be printed.

The Constitution of the United States, like that of Great Britain, guarantees to every citizen the right of petition for a redress of grievances.

This constitutional right was practically nullified once in our history by the action of the national House of Representatives in the case of those petitions which related to the abolition of negro slavery. This was the so-called gag resolution of January, 1840, which provided that no antislavery petition should be received or heard by the House of Representatives.

PETITION AND ADVICE, THE HUMBLE. A written constitution of England during the Protectorate. The first Parliament elected according to the Instrument of Government (q.v.) was dissolved because it assumed the function of altering the constitution under which it was called. A second Parliament was summoned by Cromwell, who was in urgent need of money, to meet on Sept. 17, 1656, but nearly 100 of its members had to be excluded as hostile to the Protector's government. After this purge the assembly was ready to carry out Cromwell's wishes, asked him to take the title of King, and

laid before him for approval a Humble Petition and Advice. This may be regarded as practically an amended constitution, although it did not entirely supersede the Instrument of Government. The Protector declined the royal title, but after some alteration the Humble Petition and Advice was passed and received his assent on May 25, 1657. On the 26th of the following month it was somewhat modified by the Additional Petition and Advice, designed mainly to explain certain doubts and questions which had arisen. As a result of the two instruments the powers of the Council of State were lessened and those of the Parliament were increased. Henceforth the latter was to consist of two Houses, and the Protector was not again to exclude from sitting therein those who had been legally elected. As some compensation for this loss of authority he was allowed to appoint his successor and to nominate the life members of "the other House," which was substituted for the House of Lords. The text of the Petition is contained in S. R. Gardiner, *Constitutional Documents of the Puritan Revolution* (Oxford, 1889). Consult also David Masson, *Life of Milton* (London, 1873-94). See CROMWELL, OLIVER.

PETITION OF RIGHTS. A declaration of certain rights and privileges of the subject obtained from King Charles I in his third Parliament (1628). It was so called because the Commons stated their grievances in the form of a petition, refusing to grant the supplies till its prayer was heard. The petition is supposed to be a mere corroboration and explanation of the ancient constitution of the kingdom, and after reciting various statutes, recognizing the rights contended for, prays "that no man be compelled to make or yield any gift, loan, benevolence, tax, or such like charge, without common consent by act of Parliament; that none be called upon to make answer for refusal so to do; that freemen be imprisoned or detained only by the law of the land, or by due process of law, and not by the King's special command, without any charge; that persons be not compelled to receive soldiers and mariners into their houses against the laws and customs of the realm; that commissions for proceeding by martial law be revoked." The King at first eluded the petition, expressing in general terms his wish that right should be done according to the laws and that his subjects should have no reason to complain of wrongs or oppressions; but at this reply the Commons expressed dissatisfaction and prepared a remonstrance against the advisers of the King. The King thereupon ordered them not to meddle with affairs of state. The Commons then took up the charges against Buckingham, when the King yielded to their demands and gave his assent to the petition, June 7, 1628.

PETITIO PRINCIPII, pè-tish'î-ô prin-sîp'î-i (Lat., begging of the question). The name given in logic to that species of vicious reasoning in which the proposition to be proved is assumed in the premises of the syllogism.

PETIT JOURNAL, pe-té' zhôor'nâl', L. A daily paper, founded at Paris in 1863, republican in politics, with an immense circulation throughout the country as well as in Paris.

PETIT MAL, pe-té' mál'. See EPILEPSY.

PETIT MARTINIQUE, pe-té' mâr'tè'nek'. See GRENADINES.

PETITOT, pe-té'tô', JEAN (1607-91). A

painter in enamel, the foremost artist in this branch. (See *MINIATURE PAINTING*.) He was born in Geneva, Switzerland, where he learned the jeweler's trade under Pierre Bordier, and early began to use enamel in connection with his work. He removed with Bordier to France, and afterward to England, where he soon attracted the notice of Charles I. He had apartments in Whitehall and made various portraits of the King and his court. One of the Duchess of Southampton (1642), in the collection of the Duke of Devonshire, is called his masterpiece; another, of the Duchess of Richmond, is in the Morgan collection, New York. After the execution of Charles I Petitot went with the royal family to Paris, where he formed a partnership with Jacques Bordier, a cousin of Pierre, who was largely responsible for the enamels of the portraits designed by Petitot. The latter enjoyed the favor and patronage of Louis XIV; he lived in the Louvre and painted the King, Cardinal Mazarin, the Duchess de la Vallière, and other celebrities of the time. These are included in the collection of his works in the Louvre, but he is seen to best advantage in England in the Jones collection, in South Kensington Museum, in Windsor Castle, and in private collections. He is admirably represented also in the J P Morgan loan collection, Metropolitan Museum, New York. His discoveries of new colors, particularly in the flesh tints and in reds, transformed the art and enabled him to attain delicate and harmonious effects. The Revocation of the Edict of Nantes of 1685 sent him back to Geneva, despite the fact that Louis had Bossuet himself try to convert him. In Geneva the aged artist was constantly employed by John Sobieski, King of Poland, and other distinguished patrons, until his death at Vevey. Consult G. C. Williamson, *History of Portrait Miniatures* (London, 1904), and Ernest Stroehlin, *Petitot et Bordier* (Geneva, 1905).

His son and pupil, JEAN LOUIS PETITOT (1652-c 1730), divided his time between Paris and London, where he was frequently employed by Charles II. Although his work resembles his father's to such an extent that it is frequently confounded with it, and is often masterly, it lacks the latter's purity of color. His portraits of Charles II, Peter the Great, and others are in the South Kensington Museum, London, and he is excellently represented in the Morgan collection (Metropolitan Museum, New York) and in the Earl of Dartrey's and other private collections in England.

PETIT-QUEVILLY, pe-té'-ke-vé'yé. A town of France in the Department of Seine-Inférieure, situated on the left bank of the Seine 2 miles southwest of Rouen. Its principal industries are cotton and linen spinning and the manufacture of shoes, chemicals, starch, soap, and machinery. Pop., 1901, 13,948; 1911, 16,682.

PETIT-THOUARS, ABEL AUBERT and LOUIS MARIE AUBERT, DU. See DUPETIT-THOUARS.

PETO, SIR SAMUEL MORTON (1809-89). An English contractor and legislator, born in Woking, Surrey. He was apprenticed to his uncle, a builder, at whose death in 1830 he and his cousin, Thomas Grissell, inherited the business and established the firm of Grissell and Peto. They secured a number of important contracts, among them those for the Conservative and other clubhouses, several London theatres, the Nelson Column, the Houses of Parliament, and a large part of the Great Western and the

Southeastern railroads. In 1846 they dissolved their partnership, Grissell taking the building and Peto the railroad contracts. The same year Peto took Edward L. Betts into partnership with him, and the new firm secured contracts for railroads in England, France, Norway, Denmark, Russia, Canada, and Australia. During the Crimean War Peto constructed a railroad between Balaclava and the intrenchments, which proved of great service and for which he was created Baronet in 1855. He served several terms in Parliament, but in 1868 was obliged to resign because of the failure of his firm during the financial panic of 1866. Consult *Sir Morton Peto: A Memorial Sketch* (London, 1893).

PETŐFI, pé'té-fi, SÁNDOR (ALEXANDER) (1822-49). The national poet of Hungary, born at Kiskőrös in the County of Pest, Dec. 31, 1822. His father was a butcher and a small landowner in Little Cumania (a country celebrated by Petőfi in his poem *Kis Kunsg*) and bore the name of Petrovics, a name indicating Serb origin. His Slovak mother only learned Hungarian after her marriage. In 1838 his father was impoverished by an overflow of the Danube, which destroyed his little estate; and it was only by the help of kinsmen that he was able to rear his son for a profession. Petőfi was sent to the lyceum of the town of Schemnitz (Selmecz). He ran away with a band of German strollers, and again from school at Oedenburg, this time enlisting as a common soldier (1839). After two years in the army a physician brought about his discharge and he went home. He afterward went to Pápa to complete his education. In 1842 he left Pápa to join a troop of comedians, but he soon parted from them. He made his way to Pressburg and afterward to Pest, where he got some employment as a translator. Going to Debreczin, he made another venture as an actor, playing the part of Othello, but again failed and spent the winter of 1843-44 ill, starving, and freezing. He did not lose courage, however, and started for Pest. On his arrival at that city he exchanged the name of Petrovics for Petőfi, and it was not long before he became famous as a lyric poet.

Petőfi introduced himself to Vörösmarty, then the poet of Hungary, who received the shabby stranger coldly, but when he had listened to his verses he exclaimed, "Hungary never had such lyrics; you must be cared for"; and from that time he treated Petőfi as a son. Petőfi was almost at once received into the Literary National Circle, at the expense of which was published his *Versek* (Verses), which appeared in 1844. This was rapidly followed by other volumes, which won boundless popularity. In September, 1847, he married his beloved "Juliska" Szendrey. In March, 1848, he was the leader in the first movement of the Hungarian revolution at Pest, and he became, by speech and pen, the advocate of the independence of Hungary. His poem, *Talpra, Magyar!* (Up, Magyar!), like later stirring lyrics, excited great patriotic enthusiasm. He enlisted in the national army, and in the beginning of 1849 he was appointed adjutant and secretary to General Bem. Petőfi was at the battle of Schässburg (Segesvár), fought on July 31, 1849, in which Bem's army was overwhelmed. He was never heard of after that day. It is believed that he was killed by a Cossack in the fight and that his body, so mangled as to escape recognition, was buried with the multi-

tude of Magyar dead left upon the field. His countrymen at first believed that he was not dead but a prisoner in an Austrian dungeon. In 1877 a rumor gained currency that Petöfi was still living as a Russian prisoner in one of the mines of Siberia, and the Austrian government was forced by public opinion to institute official inquiries in order to prove the groundlessness of the report. On Oct. 15, 1882, a monument to the poet was unveiled in Petöfi Square at Budapest, and the house in which he was born at Kiskőrös was purchased with the intent to preserve it. He left a widow and one son.

Petöfi is the greatest literary genius of Hungary and he ranks, by common critical consent, among the greatest lyric poets of the last century. An enthusiastic devotee of nature, country, and liberty, strongly attached to his mother, friends, and love, Petöfi expressed his affections in figures of unsurpassed concreteness. His unmistakable sincerity, a healthy optimism tempered by a melancholy resignation, his good-natured humor, and strong personality, all contributed to make him the most popular Hungarian poet. The most beautiful of his poems are his impassioned shorter lyrics, of which he published several collections, under the titles *Cypress Leaves on Etelka's Grave*; *Pearls of Love*; *Starless Nights*; *Clouds*. The most celebrated of his narrative poems are the humorous *János, the Hero and Istók, the Fool*. His earliest work was *The Wine-Drinkers*, published in 1842; his latest, *The Assessor of the Judgment-Seat*, which appeared in 1849. Petöfi translated Shakespeare's *Coriolanus* in 1848. A volume, containing a poem entitled *The Apostle*, was suppressed by the Austrian government after the pacification of Hungary. Petöfi published a novel, *The Hangman's Rope* (1847), which failed, like his play *Tiger and Hyena*, and he wrote several volumes of tales, criticisms, and sketches of travel; he also translated largely from English, German, and French into Magyar.

Among the numerous more or less complete German translations of Petöfi's poems may be mentioned those of Kertbeny (1858), Neugebauer (latest ed., 1909), Steinbach (1902), and Schnitzer (6 vols., Leipzig, 1910). His prose works are available in German in Reclam's Universal Bibliothek. His poems have also been translated, in part, into French (by Desbordes-Valmore and Ujfalvi, 1872, and others), Flemish, Polish, Danish, and Italian; and an English version, comprising his finest poems, was published in London in 1866 by Sir John Bowring. A number of *Selections*, translated by Phillips, appeared at Philadelphia (1885), and a volume of *Gems from Petöfi*, translated by W. Loew, at New York (1881; enlarged as *Poetry Selections from Hungarian Poets*, ib., 1899). An édition de luxe of Petöfi's complete works was published in 1874 (Pest), and a critical edition by A. Haras in 1892-96 (6 vols., ib.). Consult: A. Bubenik, *Petöfi: eine Skizze seines Lebens und Dichtens* (Vienna, 1882); Fischer, *Petöfi's Leben und Werke* (Leipzig, 1889); and the biographies in Magyar by Zilahy (Budapest, 1864), A. Vutkovics (Pressburg, 1883), Gyulai (Budapest, 1884), Ferenczi (ib., 1896). The publication of a periodical devoted to the poet, *Petöfi Museum*, was begun in 1888.

PETOSKEY, pē-tōs'kē. A city and the county seat of Emmet Co., Mich., 191 miles north by east of Grand Rapids, on Little Traverse

Bay, an arm of Lake Michigan, and on the Grand Rapids and Indiana and the Pere Marquette railroads (Map: Michigan, E 3). Steamers ply several of the important lake ports. Petoskey is an attractive summer resort and has a Carnegie library, a county normal school, two hospitals, and a beautiful system of parks. There are ironworks, foundry and machine shops, limekilns, block and flooring factory, lumber and flour mills, a leather factory, rotary-pump factory, launch and rowboat factory, rug and carpet factory, etc. Petoskey became a city in 1896. The water works and electric-light plant are owned by the municipality. Pop., 1900, 5285; 1910, 4778.

PETRA (Gk. *πέτρα*, rock). An ancient city in northern Arabia, about 70 miles northeast of Akabah. It occupied a narrow rocky valley overhung by mountains, the highest and best known being Jebel Harun, or Mount Hor, directly to the west. Petra owes its Greek name to its peculiar character as a rock city. It is possibly a translation of Zur, which the Greek version with its *πέτρα* suggests as the original text rather than Gur in 2 Chron. xxvi. 7. Jerome identified it with Sela', which also means rock, in 2 Kings xiv. 7, Isa. xvi. 1, a place captured by Amaziah of Judah and called Joktheel. But Petra is thought by some scholars to be too far south for Sela, and both Musil and Dalman identify Sela' with the modern Chirbet Sil', or a neighboring site, farther north, within what may be regarded with certainty as Edomitic territory. The question, however, must be left open. According to Josephus (*Ant.*, iv, 7, 1) the native name of Petra was Rekem, and there can be no doubt about this. He also declares that it was named after Rekem, the Midianitish King mentioned with Zur and others in Num. xxxi. 8, and that the tomb of Aaron was in the neighborhood. (*Ant.*, iv, 4, 7.) The Targums wrongly identify Rekem with Kadesh Barnea (q.v.), probably confusing two places around which traditions of Moses and Aaron clustered. If Zur refers to Petra in 2 Chron. xxvi. 7, Uziah (c.777-737) fought with the Arabians who dwelt there; and if Sela' refers to Petra in 2 Kings xiv. 7, Amaziah (796-777) conquered it. The traditions concerning Jebel Harun as the site of the tomb of Aaron and the stream of Ayun Musa flowing through the Sik as the waters Moses brought from the cleft rock, which cannot well have developed in Nabatean times, speak in favor of an early Jewish occupancy of the place. But our real knowledge of Petra begins in 311 B.C., when Athenæus surprised the city in the night and held it for a few hours, only to leave the following morning and to suffer a crushing defeat at the hands of 8000 Nabateans. In the same year Antigonos sent Demetrius to take the city; he besieged it in vain and agreed to march off in return for a present of 700 camels. The tombs of the third century B.C. still show the genuinely Nabatean style. In the second century Hellenic influence began to be strongly felt. Petra remained the capital of a Nabatean kingdom, whose rulers have left numerous inscriptions and whose history is otherwise known through Greek writers (see **NABATEANS**), until it was conquered by Cornelius Palma in 106 A.D. and made the capital of the Roman Province of Arabia. Hadrian visited the city in 129 A.D. and increased its privileges. There is no evidence of Christianity having been introduced before Constantine. (Cf.

Harnack, *Die Mission und Ausbreitung des Christentums*, Leipzig, 1902, p. 447.) According to Sozomen (*Ecc. Hist.*, vii, 15) the inhabitants of Petra strongly opposed Christianity about 400 A.D., and Epiphanius describes their Dusares cult. But in the fifth century Petra became the seat of a metropolitan, and Arabia Petraea under the new name Palæstina Tertia was assigned to the patriarchate of Jerusalem. As trade began to follow other channels the importance of Petra declined. It was conquered by the Moslems in the seventh century, and gradually fell into ruins. The signs of occupation by the Crusaders are slight. The very site was unknown to Europeans for centuries, until it was discovered by Burckhardt in 1812. Since then the remarkable remains of Petra have been seen and examined by many travelers. The most careful study of them has been made in recent years by Brünnow and Domaszewski, Musil, and Dalman. They stand in a small open irregular basin about $\frac{1}{2}$ mile square, through which runs a perennial stream of purest water, and are best approached by an extraordinary chasm or ravine called the Sik, or Wadi Musa, narrowing as it proceeds till in some places the width is only 12 feet, while the rocky walls of red sandstone tower to a height of from 100 to 200 feet. This gorge was once the highway to Petra, and the remains of an ancient pavement can be traced beneath the brilliant oleanders that now line the stream. All along the face of the rocky walls are rows of cave tombs, hewn out of the solid stone and ornamented with façades. These are also numerous elsewhere in and about the city. Brünnow and Domaszewski examined over 800 of these tombs in the necropolis of Petra. Among the most important ruins the following deserve special mention. The most beautiful of all the temple tombs is Herabet el jerra (the ruin of the urn), or Haznet Fir'un (the treasury of Pharaoh). It directly faces the gorge of Wadi Musa. On the façade Isis is represented with her symbols, the horned solar disk and the ears of corn, six Amazons, two of the Eumenides, the Dioscures, eagles, a panther, a lion, and other figures. Domaszewski regards it as an Isis temple built at the suggestion of Hadrian; Dalman accepts the judgment of De Luynes and Studniczka that it belongs to the Hellenistic period, and considers it as a tomb temple, possibly erected by a prince like Aretas III Philhellen (83-60 B.C.). The amphitheatre, capable of seating some 5000 spectators, is comparatively well preserved. The Deir, or Convent, is a huge monolithic temple or temple tomb hewn out of the side of a cliff and facing Mount Hor. Kasr Fir'un (Pharaoh's palace) is the best-preserved ruin of Petra, east of which are the remains of a triumphal arch. A most interesting sanctuary on Zibb 'atuf, discovered by Edward L. Wilson in 1882, was at first thought to be a very ancient high place, but Savignac and Dalman assign this well-preserved open-air temple without wall, but with court, altar, mensa sacra, and throne of the god (probably Dusares), to the first century B.C. On the tomb of Aaron, which is not inaccessible, as has been so often asserted, but was visited by Schmidt in 1905, see AARON. Three distinct periods of architecture have been discerned at Petra—the early Nabataean, down to the beginning of the second century B.C.; the Hellenistic, to 106 A.D.; and the Roman, from that time to the destruction of the city. Over

80 Nabataean inscriptions, a dozen in Greek, and a few in Latin and in Arabic have been found at Petra. Some of them are dated. The ruins of the city, which at one time may have had a population of from 40,000 to 50,000, bear most eloquent testimony to its power, wealth, and culture.

PETRALITE. See EXPLOSIVES.

PETRARCH (It. **PETRARCA**, pâ-trär'ka), FRANCESCO (1304-74). An Italian poet and humanist, born at Arezzo, July 20, 1304, of a family then in exile from Florence because of its affiliation with the party of the Bianchi. To the family name Petrarco the young Francesco gave the more pleasing form Petrarca. The wanderings of the family took the lad to Pisto in 1310 and in 1313 to Avignon in France. After preliminary training he was sent to Montpellier in 1319 to study law. Some four years later he went unwillingly to Bologna to continue his studies in jurisprudence, for he shrank from pettifoggery, though he admired the majesty of Roman law. A love of the classics, particularly of Cicero, early took possession of him. To them he devoted himself after the death of his father (1326), who had once flung his son's books of poetry and rhetoric into the flames, allowing the half-burnt manuscripts to be rescued, however, at Francesco's passionate entreaty. His father having left him no means to continue his studies, he returned to Avignon and took minor orders as an ecclesiastic, thus providing for himself a livelihood which insured to him the freedom which he so jealously guarded. He entered into the gay and fashionable life of Avignon, at that time the seat of the papacy and the animated meeting place of Italian and French culture. There in 1327 he met that Laura who was to inspire his imperishable lyrics. We cannot yet be certain of her identity, but it is probable that she was Laura de Noves, wife of Hughes de Sade and mother of 11 children at the time of her death by the plague of 1348. Her relations with Petrarch during these 21 years seem to have been as innocent as they were beautiful.

But his love for Laura was only another cause for restlessness. Animated by that interest in the external world that is characteristic of the Renaissance, he traveled through Belgium, Switzerland, France, Spain, and even Hungary, constantly questioning, seeking for direct information. In this he is as modern as when he looks within himself and describes his impressions and his emotions. In 1337 for the first time he entered Rome. That same year an unknown woman bore Petrarch a son, Giovanni, and probably it was she who gave him a daughter Francesca in 1343. These children were legitimized by papal bulls. At intervals he went back again

to Avignon, and thence he withdrew for a while to the solitude of Vaucluse, (Valchiusa). It was here that he received in 1340 from the universities of Paris and Rome invitations to visit those places and receive the crown of the poet laureate. He decided in favor of the University of Rome, and on Easter Sunday, 1341, he was publicly crowned on the Capitol. He visited many Italian cities and in 1343 was sent by Pope Clement VI on an embassy from Avignon to Naples. Constantly on the alert for manuscripts, he had the good fortune to discover some of the letters of Cicero, just as he had earlier brought to light two of Cicero's orations. He may also have found a part of the *Institutiones* of Quintilian. At Parma he received tidings in 1348 of Laura. The news of her death and of that of his friend Cardinal Colonna affected him greatly and was the inspiration of new songs. In 1350 he was in Florence with Boccaccio and in 1351 Boccaccio visited him at Padua. Having refused several offers of apostolic secretariats from the holy see, he left Avignon for good in 1353. About this time began his connection with the Visconti in Milan, who in 1356 sent him to Prague as Ambassador to Charles IV of Germany, and in 1360 he undertook a similar mission to Paris. The remaining years of his life were mainly spent in scholarly pursuits at Arqua, near Padua, and there, July 18, 1374, he died, after a life which in spite of its inconsistencies, his advocacy of civic independence, and his praise of the tyrant Galeazzo, his desire for office and his unwillingness to accept it for fear of losing his freedom to come and go, his love of quiet and his constant travel, his vows of celibacy and his proclaimed paternity, had had more than the usual measure of success and some moments of glory.

His Latin works, on which he prided himself—the *Africa*, in hexameters, dealing with the undertakings of Scipio Africanus, moral, historical, and other scientific treatises, letters, the *Carmen Bucolicum* and the *Epistole Metricæ*, which contain many allusions to events of his time and life, as do also his *Lettere*—have not the elegance of Poliziano or Bembo nor the polished brilliance of Erasmus; yet his zeal for the correction of manuscripts and the accumulation of learning and his passionate love of living antiquity were among the powerful influences in the Renaissance and mark an epoch in the development of modern scholarship. But it was the *Canzoniere*, most of them sonnets to the golden-haired Laura, living and dead, some of them to his friends, which brought Petrarch even in his lifetime that fame which he believed his writings would win for him. The canzone to Italy breathes a passion of patriotism not heard again in the lyric until Leopardi. The songs to those scenes in which he has lived show not so much keen observation as appreciation of the beauties of nature which are the setting of his emotion—another link with the nineteenth century. The forms of verse he took from the earlier love poets, and occasionally fell into some of their mannerisms. It was these trivialities caught up by later versifiers which were developed into the Petrarchism for a while rampant in France and Spain as well as in Italy. It must be admitted also that Petrarch's instability of mood—his belief one moment that his love for Laura is a good, which will bring him glory and salvation, and that of the next that it is an evil bringing him suffering in this

world and damnation in the next—gives the basis for the antitheses carried to such extremes by the Petrarchists. Petrarch is not all modern. Besides the traces of troubadour workmanship in his verse there is mediæval mysticism in his thought. For the most part a sensuous pagan rejoicing in the beauty of his world, he is often the ascetic and fearful Christian. Perhaps his greatest service was the formulating of the æsthetics of his age. With the ideal of style constantly before him he labored at his Latin writings. With the ideal of beauty he gave to some of his sonnets a classic plasticity, and in his constant observation of his inner state, he discovered that each moment brings with it the possibility of a lyric.

Bibliography. The edition of Petrarch's Latin and Italian works published at Basel in 1554 forms the basis for all later editions. Consult also a critical edition of the *Africa* by Corradini (Padua, 1874, with an Italian translation by Gaudio, Oneglia, 1874); also one by Agostino Palesa (Milan, 1904); the *Poemata Minora* (Milan, 1829-34); the editions of the *Canzoniere* by Mestica (Florence, 1895) and by Carducci and Ferrari (ib., 1899); the editions by Fracassetti (ib., 1859-63) of the *Epistole de Rebus Familiaribus et Variæ*, published in Italian as the *Lettere di Francesco Petrarca (familiari e varie) volgarizzate e dichiarate* (ib., 1863-67); and *Lettere senili*, etc. (ib., 1869-70); *The Triumphs of Francesco Petrarca, Florentine Poet Laureate*, translated by Henry Boyd, with introduction by Guido Biagi (Cambridge, Mass., 1906); A. PETREL (Fr. *pétrel*, from ML. **Petrellus*, dim. of Lat. *Petrus*, Peter; so called in allusion

PETRARCH

FROM AN ENGRAVING BY RAFFAELLO MORGHEN AFTER A PAINTING BY TOFANELLI

to its walking on the sea, like the Apostle Peter). A sea bird of the family Procellariidae, containing several genera and distinguished by having the bill hooked at the tip, and hard, and the nostrils united into a tube along the culmen, and the hind toe merely rudimentary. Petrels have very long and pointed wings and the tail square or slightly forked. They possess great power of wing and are among the most strictly oceanic of birds. Among the 70 species of the Procellariidae are reckoned the fulmars and shearwaters (q.v.), besides the many petrels proper, of which the stormy petrel is an example. They run along the surface of the waves in a remarkable manner and with great rapidity

TYPE OF PETREL BILL.

Side and top views of bill of pintado petrel (*Daption capensis*), showing the tubular nostrils.

sea is stormy and the mollusks and other animals that form their food come in abundance to the surface. From the frequency with which flocks of these birds are seen in windy weather, or as heralds of a storm, they are superstitiously regarded by sailors. They are to be seen in the seas of all parts of the world, but are more abundant in the Southern than in the Northern Hemisphere.

The names stormy petrel and Mother Carey's chicken are sometimes more particularly given to *Procellaria*, or *Thalassidroma pelagica*, a bird scarcely larger than a lark, 5½ inches long, and the smallest web-footed bird known. It is sooty black in color, with a little white on the wings and near the tail. Two other species of petrel are of frequent occurrence in the North Atlantic, Leach's petrel (*Oceanodroma leucorhoa*) and the better-known Wilson's petrel (*Oceanites oceanicus*). The former may be recognized by its larger size (8 inches long) and its forked tail. It breeds among the islands in the Bay of Fundy, and in similar places in the North Pacific. The Wilson's petrel, on the other hand, is a bird of the Antarctic regions, and migrates during its winter (our summer) into the Northern Hemisphere. It is easily distinguished by its small size (7 inches long), the yellow on the webs of the feet, and the white upper tail coverts. Besides these three species, no less than a dozen others have been recorded from the coasts or inland waters of the United States. Of these one is a common Pacific coast species, two others are known only from the coast of southern California, while the remaining nine are stragglers from the Southern Hemisphere. The cape pigeon (*Daption capensis*), or pintado, is a very large species, well known to voyagers about the Cape of Good Hope; and in the Indian Ocean and about the shores of Australia occurs the giant of the family, the huge bone breaker (*Ossifraga gigantea*), which sailors call stinkpot, and other names referring to its vile odor. Petrels generally breed in holes and clefts of rock or on secluded coasts, and are likely to visit their nests (except when the female is sitting) only at night. Only a single egg is laid, as a rule, which is white, or sprinkled with a few fine reddish dots. See COLORED PLATE OF EGGS OF AMERICAN WATER AND GAME BIRDS.

Consult: S. F. Baird, *Water Birds of North America* (Boston, 1884); A. H. Evans, *Birds* (London, 1901); Godman, *A Monograph of the Petrels* (ib., 1913).

PETRI, pã'trë, OLAVUS (1493-1552). A Swedish reformer, born at Orebro in Nerike. He studied at Upsala and the University of Leipzig, and afterward at Wittenberg, where he continued his theological studies under Luther and Melancthon. Upon the recommendation of King Gustavus I he was appointed town clerk of Stockholm (1524) and at the same time preached in the cathedral, where he fearlessly expounded and urgently pleaded for the introduction of the reformed religious service. Petri was the first to introduce the Reformation into Sweden. In 1526 he translated the New Testament into Swedish and later, with his brother, the Old Testament. He wrote the first hymn book in Swedish, also a Swedish chronicle (to 1520). This was published in the *Scriptores Rerum Suecicarum Medii* (1818). From 1531 to 1533 he was chancellor of the King, but his enthusiasm got him into trouble with his sovereign and at one time seemed likely to cost him his life.

His brother, LAURENTIUS (c.1499-1573), first Lutheran Archbishop of Sweden, was born at Orebro. About 1527 he was appointed professor of theology at Upsala, and in 1531 he was elected first Lutheran Archbishop. He drew up the first Swedish Evangelical church order that was printed (1571) and wrote many theological treatises defending the principles of Church reform.

PETRIE, pe'tri, (WILLIAM MATTHEW) FLINDERS (1853-). An English Egyptologist, born at Charlton, June 3, 1853, the son of William Petrie and Anne, daughter of Capt. Matthew Flinders, the Australian explorer. He was educated at private schools and at first turned his attention to the study of British archaeology. His earliest works were *Inductive Metrology* (1875) and *Stonehenge: Plans, Descriptions, and Theories* (1880). From 1880 to 1914 he occupied himself with the investigation of Egyptian antiquities and made many valuable discoveries. Between 1884 and 1886 he excavated the site of Tanis, Naukratis, and Daphne and revealed the existence of ancient Greek settlements at the two latter places. From 1888 to 1890 he worked in the Fayum, finding a number of interesting funeral portraits at Hawara and gathering an extensive collection of valuable papyri, chiefly from the ruins of Kahun and Gurob. In 1890, working under the Palestine Exploration Fund (q.v.), he was engaged in the excavations of the site of ancient Lachish at Tell el Hesay. (See also BLISS, FREDERICK JONES.) In 1892 he was appointed Edwards professor of Egyptology in University College, London. See GLASS for his views on the early manufacture of this substance. At Nagada he discovered in 1895 the remains of a prehistoric race, and the following year found at Thebes the stele of Meneptah, containing the sole mention of Israel occurring in the Egyptian inscriptions. After 1899 he investigated the very interesting tombs of the first dynasty at Abydos. In general, for accounts of his explorations, consult the publications of the Egyptian Exploration Fund. Petrie received honorary degrees from Oxford and other universities. Among his more important works may be mentioned: *The Pyramids and Temples of Gizeh* (1883); *Tanis I and II* (1885-87); *Hawara* (1889); *Kahun* (1890); *Ten Years' Dig-*

gings (1893); *A History of Egypt* (1894; new ed., 5 vols., 1905); *Tell el-Amarna* (1894); *Egyptian Tales* (1895-99); *Religion and Conscience in Ancient Egypt* (1898); *Royal Tombs of the First Dynasty* (1900-01); *Methods and Aims of Archaeology* (1904); *Religion of Ancient Egypt* (1906); *Personal Religion in Egypt* (1908); *Arts and Crafts in Egypt* (1909); *The Growth of the Gospel* (1910); *Historical Studies* (1910); *Revolutions of Civilization* (1911); *The Formation of the Alphabet* (1912); *Tarkhan I* (1913); *Tarkhan II* (1914).

PETRIFICATION (from Lat. *petra*, from Gk. *πέτρα*, rock + *facere*, to make). A name given to organic remains found in the strata of the earth, because they are generally more or less mineralized or made into stone. The word has fallen into disuse, having given place to the term "fossil" (q.v.).

PETRIFIED FOREST. See NATIONAL MONUMENTS.

PETRIFIED FORESTS. The same as fossil forests (q.v.).

PETRIFIED WOOD. Plant remains in which the woody tissue has been replaced by mineral matter, usually some form of silica. The name "dendrolites" has been given to petrified fragments of plants that are commonly found in the coal measures. See FOSSIL FORESTS.

PETROBRUSIANS. See BRUYS, PIERRE DE.

PETROGRAD, *pyētrō-grāt*. The official name of the capital of the Russian Empire. The name St. Petersburg was abandoned during the European War which broke out in 1914 because of its Teutonic origin. See SAINT PETERSBURG.

PETROGRAPHIC PROVINCE (from Gk. *πέτρα*, *petra*, rock + *γράφειν*, *graphein*, to write). A region within which the igneous rocks reveal a relationship (so-called consanguinity) in chemical composition, which may be referred to a community of origin. This relationship may be chemically a close one, but the rocks have widely varying mineralogical composition, or the kinship may be restricted to one or more of the chemical components in the rocks.

PETROGRAPHY. See PETROLOGY

PETROLATUM (Neo-Lat., from ML. *petroleum*, rock oil, from Lat. *petra*, from Gk. *πέτρα*, rock + *oleum*, from Gk. *ἐλαίον*, *elaion*, oil). A residue from the distillation of petroleum, prepared by filtration, and known to the trade by different names, as petroleum jelly, vaseline, and cosmoline. Petrolatum is a white or amber-colored, translucent, semisolid substance, slightly soluble in alcohol and readily so in ether. It does not become rancid, and is largely used in pharmaceutical preparations, especially ointments, instead of the ordinary fats. Taken internally, it is a remedy for coughs and colds. It is an excellent lubricant and will protect polished steel from rust. The term "vaseline," while often applied to petrolatum in general, is really a trade name, protected by copyright, belonging to one particular preparation. See PETROLEUM.

PETROLEUM (ML., rock oil). A natural rock oil composed chiefly of hydrocarbons. It is classed with natural gas and asphalt as a bitumen, natural gas containing the more volatile members of the series, asphalt the solid, while petroleum is composed chiefly of the liquid members, although it contains a small proportion of both solid and gaseous compounds.

History. Petroleum has long been known in

various parts of the world by its appearance in the form of bituminous springs or as a floating scum on the surface of pools. It was used at a very early period in the walls of Babylon and Nineveh, and Herodotus has described the occurrence of oil springs in the island of Zacynthus, now Zante. In Roman times petroleum was obtained from Sicily and burned in lamps. The first mention of petroleum in America (about 1635) is in a letter written by the Franciscan missionary Joseph de la Roche d'Allion, who refers therein to springs found in the region of what is now southwestern New York or northwestern Pennsylvania. The early settlers of Pennsylvania obtained small quantities of oil by digging wells and scooping out the liquid which seeped in from the surrounding rocks. The drilling of brine wells on the western slopes of the Alleghenies in the early part of the nineteenth century led to the discovery of petroleum at greater depths. A well sunk near Burkesville, Ky., in 1829, yielded great quantities of oil, which flowed to the surface and was drained into the Cumberland River, where at one time it was set on fire. The most important application of petroleum in the early days was in medicine; it was utilized as an illuminant only to a small extent, owing to its offensive odor. In the year 1853 Dr. Brewer suggested the use of petroleum for lubricating and illumination purposes and set to work devising means for purifying the crude product. The Pennsylvania Rock Oil Company was organized in 1854 to drill for oil; although its first well yielded from 400 to 1000 gallons a day, the company was not successful in its business ventures. Five years later, however, Col. E. L. Drake put down a productive well on land leased from this company, and the successful outcome of this undertaking may be said to mark the beginning of the oil industry in the United States. The news of the discovery was followed by a rush of adventurers from all parts of the country, so that by 1860 more than 100 square miles of territory in the vicinity of Oil Creek had been shown to be productive. Much of the oil which reached the surface was allowed to escape, owing to the lack of storage and transportation facilities. As the explorations were extended new fields were opened along the Allegheny River in Pennsylvania, also in Ohio and West Virginia. The Lima field in Ohio and Indiana was first developed in 1885, while the California fields have become large producers only in the last few years. The discovery made in the Beaumont region of Texas early in 1901, which has been followed by extraordinary development, and the discovery of wells of enormous yield in Mexico represent important events in the recent history of petroleum.

Among foreign countries Russia is the largest producer of oil and the strongest competitor of the United States in supplying the world's markets. Operations have been conducted in this country since 1873. The largest fields are located on the Apsheron Peninsula, Baku being the chief centre of the industry. The distillation of petroleum from shales was first undertaken in France in 1834 and was successfully introduced into Scotland in 1850. The importation of shale oil into America led to the use of canal coal for distilling; this industry gained considerable importance in the United States previous to 1860, but quickly succumbed when the first wells became productive.

PETROLEUM

1. OIL WELLS AT LOS ANGELES, CALIFORNIA
2. OIL WELLS ON THE BEACH AT SUMMERLAND, CALIFORNIA

Origin and Geological Occurrence. The geological histories of petroleum and natural gas are closely connected, so that what is said of one practically holds true of the other. Petroleum is, with few exceptions, always found in sedimentary rocks. For many years it was known only in sandstones or shales, and the term "oil sand" was applied to the rock that held it. Subsequently oil was struck in limestone in Ohio, thus forming a new type of occurrence, although one which has since proved to be unique.

Petroleum is considered by most geologists to be of organic origin, as shown by its persistent occurrence in sedimentary rocks, but whether it has been derived from animals or plants, and, if the latter, whether marine or land forms, is still open to dispute. Moreover, the exact details of the process by which organic matter has been converted into oil and gas are somewhat obscure. As opposed to the organic theory is the inorganic one, which assumes that the oil and gas may be hydrocarbons, formed at great depths by the action of steam on metallic carbides—a process that can be demonstrated experimentally, but which is not borne out by field evidence. Another inorganic theory, having many adherents but assented to by few geologists, is that the hydrocarbons of oil and gas are volcanic exhalations.

Petroleum occurs in all geological formations from the Lower Silurian or Ordovician up to the Tertiary; it is chiefly of importance in the Silurian, Devonian, and Tertiary rocks. In these formations the oil may at one place or another be found in sandstone, limestone, or shale, and exceptionally in metamorphic rocks, but in the latter case it has clearly migrated from adjacent sedimentary ones.

In former years great stress was laid on the association of oil with anticlinal or arch folds, capped by previous beds, it being pointed out that where it occurred with gas and water the three tended to arrange themselves according to their specific gravities—gas at the crest, then oil, then water. Subsequent studies have demonstrated quite clearly that sufficiently free movement for such gravitative arrangement does

that this rock should be porous. The degree of porosity not only influences the quantity of oil which the rock can hold, but it may also influence the rate of flow of the well. Some wells may yield as little as 15 barrels per day; others may reach a production of 50,000 or 60,000 barrels per day, or in extreme cases over 100,000 barrels. The porosity of the oil-bearing formation may also change from place to place and would account for the location of a profitable well at one point and a barren one a short distance from it. In order to prevent the escape of oil from the containing stratum it should also be overlain by a rock of more or less impervious nature. (In many wells the petroleum flows to the surface under pressure. Professor Orton believed that the oil was under hydrostatic pressure; according to his theory the pressure in different wells of the same basin or pool ought to be nearly constant. In any region, however, the pressure usually diminishes with time. While Orton's theory may be true for Ohio, it seems doubtful whether hydrostatic pressure will account for the great oil and gas pressure found in some regions. The quantity of oil which a given territory can yield is often very great, since some sand will hold as much as one-eighth of its bulk in oil under pressure. In clean sands the porosity may be 30 per cent, but even though the pores be filled with oil, it may not all be recoverable. If a sand contained 20 per cent voids, filled with oil, then each 100 cubic feet of sand would contain 20 cubic feet of oil, and a bed 100 feet thick covering an acre would contain 155,535 barrels. The amount of recoverable oil, however, may be only 50 per cent of the saturation. The depth at which oil is found is variable, ranging from 400 or 500 feet in some regions to as much as 4000 feet in others.

Character and Composition. Petroleum is a liquid of varying color, being black, brown, red, amber, or straw, and by reflected light often appearing greenish in tint. The black oils in the United States are obtained from the Trenton limestone of Ohio, from California, etc.; the Pennsylvania oils are often of amber tint. Petroleum commonly vary in specific gravity

THE CHEMICAL COMPOSITION OF PETROLEUM

LOCALITY	C	H	O	Specific gravity H ₂ O = 1
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	
Heavy oil, West Virginia	83.5	13.3	3.2	.873
Light oil, West Virginia	84.3	14.1	1.6	.8412

not exist in a porous rock, and that the arrangement and movement of these substances are probably affected by their difference in surface tension and its relation to the pore sizes as well as by hydrostatic motion. Most oil occurrences show a relation to some structure resembling an inverted basin, but some petroleum deposits are found in joint planes, with volcanic necks or with salt domes, or rarely in synclines. The rock in which the oil is found is spoken of as the reservoir or oil sand, and it is essential

between about 0.8 and 0.98, as compared with water. The gravity of an oil is most commonly expressed in degrees of the Beaumé scale, on which water has a gravity of 10 degrees. The temperature at which crude petroleum may solidify ranges from 82° F. in some Burma oils to several degrees below zero in some Italian oils. The flashing point, or the lowest temperature at which inflammable vapors are given off, may be as low as zero degrees in the Italian oils to as high as 370° F. in an oil found on

the Gulf coast of Africa, but these are extreme limits. There is a similar great range in the boiling point, which is 180° F. in some Pennsylvania oils and 338° F. in oils found at Hanover, Germany.

A number of different hydrocarbons have been found in petroleum. Those of the paraffin series are important, as are also the olefines. The acetylene series is represented in some, while the benzene series occur in nearly all, but not in large amounts. Most petroleum contains some nitrogen, but it rarely exceeds 2 per cent, except in some California oils, where it may reach 10 or 20 per cent. Sulphur is rarely absent, but the quantity is usually quite small.

Asphaltic oils are those which on evaporation leave a residue consisting essentially of asphalt, while paraffin oils are those which contain chiefly hydrocarbons of the paraffin or aliphatic series, and which usually yield crystallized paraffin scales when the heavier distillates are cooled to about zero degrees Centigrade. However, the terms "asphaltic" and "paraffin base" are no longer much used.

Distribution of Petroleum. The oldest and most noted field in the United States is the Appalachian, which extends along the western slope of the Appalachian Mountains from southwestern New York (and eastern Ohio) through western Pennsylvania into West Virginia, Kentucky, and Tennessee. The oil-bearing sandstones are partly Devonian and partly Carboniferous, the latter being especially important in West Virginia. On the western border in Ohio oil is found as deep as the Silurian, and in Kentucky even in the Ordovician.

The Lima-Indiana field extends from Lima southwestwardly into Indiana, lying without the Appalachian region, as usually defined. The oil here is carried by the Trenton limestone of the Ordovician, the depth being about 1300 feet; it was first discovered near Findlay, Ohio. The oil is dark and resembles the Tennessee and Canada oils in its sulphur contents. This field is rapidly declining. In recent years Illinois has rapidly sprung into prominence as a producer, the oil coming mainly from the Carboniferous formations of the southeastern part of the State.

Oil has been found at a number of localities in the Tertiary rocks of eastern Texas and western Louisiana. Many of these oils are heavy and asphaltic and are associated with local structural domes, that sometimes contain rock salt. Somewhat lighter oils are present in the Cretaceous of northern Texas and northwestern Louisiana. The first well put down in the Beaumont field of Texas yielded 75,000 barrels of oil a day, spouting the liquid in a 6-inch column to a height of 160 feet. Another field of great prominence extends from southeastern Kansas to east-central Oklahoma, the oil lying in the Cherokee shales and sandstones of the Carboniferous. In Wyoming petroleum occurs in formations ranging from the Upper Carboniferous to the Tertiary, but mostly in those of Mesozoic age. The Cretaceous sandstone at Florence, Colo., yields a heavy oil which resembles that of Wyoming in being valuable as a lubricant. California contains several oil fields and is now the leading State in point of output. The rocks are of Cretaceous to Neocene age. The oil has usually an asphaltic base and is chiefly valuable as a fuel. The largest production comes from Kern County. Petroleum

is also known to occur in Washington, Arizona, New Mexico, Montana, and Utah. A moderate amount of oil is obtained from Lambton Co., Ontario, at a depth of 400 to 500 feet, while petroleum is known to occur in Newfoundland and New Brunswick. There are numerous showings of petroleum on the eastern flank of the Canadian Rocky Mountains up to the Arctic Ocean. Cuba is known to have at least small supplies of oil, and a limited quantity has been exported from Porto Rico. In Mexico active exploration has been carried on at several points in the Gulf coast region with the result of finding large supplies of good oil around Tampico. It has an asphalt base. Of the South American countries, Peru is the most important petroleum producer, most of the output coming from the Zorritos field. Petroleum is also said to occur in Venezuela, Argentina, and Ecuador, but it is not taken out of the ground to any extent.

Russia is the most important foreign producer of petroleum, the fields in the Baku region of southeastern Russia supplying enormous quantities annually. It is a large exporter to other countries. The greater part of the output comes from the Baku field proper, although important quantities are obtained from the Grosni field, 500 miles north of Baku. Rumania contains several promising oil fields, which occur in the same formations as the Russian fields. In Germany oil is obtained near Hanover and also in Alsace, while some is supplied by the Carboniferous rocks of Great Britain, but does not begin to supply the local demand. In Japan petroleum is obtained on the northwestern coast, and some of it is refined. The crude material sometimes yields 60 per cent of illuminating and lubricating oils. A high paraffin oil is found in Java, and Sumatra, Borneo, and the Burma field of India are important producers. While petroleum is known to occur in the Philippines, little is obtained, and that by primitive methods; the islands of Panay, Leyte, Guimaras, Negros, Bohol, Mindanao, and Cebu all carry some petroleum.

Mining and Transportation of Petroleum. The modern method of drilling for petroleum is similar to that used in sinking gas and artesian wells. See DRILL; WELL SINKING. Drill holes are usually cased, or lined with steel piping, for the purpose of keeping out water and preventing the hole from caving in.

Many holes are generally driven into the same oil pool. In some cases closely adjoining holes may have no effect on each other in respect to the flow of oil. In others the oil sands seem to be so porous that oil will easily flow from the bottom of one hole to another close by and thereby decrease the yield of the former. In many cases the oil does not flow when the oil-bearing rock is struck, and it is customary in this instance to explode a torpedo at the bottom of the drill hole, whereupon the oil almost immediately begins to pour out of the well, sometimes with tremendous velocity. In 1913 there were 19,101 oil wells in the United States.

The question of cheap and rapid transportation of crude petroleum from the wells to the refineries is one of great importance. At first the oil was transported on carts, later it was carried in barges or by railway in tank cars, but these methods gave place to the system of pipe lines. At the present day the total length of pipe lines transporting Pennsylvania crude oil is probably over 25,000 miles. The pipes, which

have a diameter of from 4 to 8 inches, are usually laid underground and have bends at regular intervals to allow for contraction and expansion. Stations with pumps and storage tanks are placed from 28 to 30 miles apart, the oil being received into the tank at one pumping station and then forced through the pipe to the next one. Since all petroleum contains more or less paraffin or wax, much trouble is often experienced in the clogging of the pipes, especially in cold weather, and to clear them out an instrument known as the "go-devil" is sent through the pipe. This is so constructed that it is forced along by the moving current of oil and scrapes the paraffin off from the inside of the tube. Pipe lines have been built from the Appalachian oil region to Jersey City, Philadelphia, Baltimore, Chicago, and Cleveland; from Kansas eastward; from Oklahoma to the Gulf of Mexico; and from the California fields to the Pacific coast.

Refining. The refining of petroleum is based upon the separation of the component hydrocarbons by a process of fractional distillation. This is usually carried out in horizontal cylindrical iron stills, which are surmounted by a dome that connects with a vapor pipe. A common size of still is 30 feet long by 12½ feet in diameter, with a capacity of from 650 to 700 barrels of crude oil. When the latter is placed in the still and subjected to increasing temperature, the oils pass off in the order of their volatility; the separation is not absolutely perfect, however, as oils of lower boiling point may carry over some higher ones. As the vapor rises it passes to the condenser, a series of iron pipes surrounded by cold water. The distillates are led off into their respective tanks. This process of distillation, which is known as the intermittent system, is the one commonly followed in the United States, and the still requires periodic refilling. In Russia a continuous system is employed, involving a series of stills, which are heated to successively higher temperatures. The crude oil then flows slowly from one to the other, and from each one there passes off the product volatilizing at the temperature to which the still is heated.

The process of fractional distillation can be divided into two parts. In the first part of the process the more volatile products, such as gasoline and burning oil, are evolved. The residue is then transferred to another still in which the second part of the operation is carried on, the oil being heated to a still higher temperature under partial vacuum or by superheated steam for the purpose of separating lubricating oils and heavier products. The condensing apparatus ends in the tail house, where the distillates are conducted to their proper tanks. When the various fractions of the distillation are to be kept separate and of constant composition, a special form of condenser may be used, by means of which the oil is brought into contact with the surface of iron turnings, thereby increasing the evaporation. If the oil contains sulphur it is necessary to redistill it in stills containing finely divided copper, which removes the sulphur. *Cracking* is a term used to denote the process of condensing the heavier vapors in the still, causing them to become superheated and decomposed, and thus obtaining a more complete separation of the fractions as well as increasing the percentage of illuminating oil. By using the side-fired still and running back all

heavy distillate the products are reduced to three fractions—paraffin, gas, and light-oil distillates. In the distillation of the oil the lightest constituents pass off first and the heaviest last. The fractions obtained in the order of their lightness are the following: *Cymogene*. This is the lightest of all, boiling point 32° F., 110° B., used in ice manufacture. *Rhigolene*. Boiling point, 65° F., 90° B.–100° B., used as an anæsthetic. *Petroleum ether*. A highly volatile product, 80° B.–85° B. It has sometimes been called Sherwood oil. *Gasoline*. This, properly speaking, is the fraction following petroleum ether, although the name is often applied to a mixture of this and the three previous ones, its gravity thus ranging from 80° B. to 62° B. In gasoline proper the boiling point ranges from 90° F. to 200° F. *Naphtha* is a name broadly applied to all light distillates, but more especially to those boiling at 80° F. to 120° F., and whose gravity varies from as low as 62° B. up to 76° B. *Benzine* (q.v.) represents the least volatile product of the naphthas and has a gravity of 82° B.–89° B., and a boiling point of 110° F. to 140° F. *Ligroine* forms a special grade of solvent naphtha, 88° B.–62° B., and a boiling point of 194° F. to 248° F. Following the lighter naphthas come the illuminating oils, divided into heavy and extra-heavy naphthas; in the process of distillation these may either be carried off separately or together. In the former case the heavy naphthas may be redistilled and separated into benzine and light distillate. The latter may then be mixed with the extra-heavy naphthas in varying proportions to form white oil or export oil. There are many grades of domestic illuminating oil or kerosene, which differ chiefly in fire test.

After the naphthas have passed off the residuum is forced through steam-jacketed filters filled with bone black or fuller's earth; the first portions of the filtrate represent light oils and are followed by successively heavier ones. When the petroleum belongs to the paraffin group, the residuum is sometimes placed in the tar still for further distillation, and there the heavy vapors are carried over by the aid of superheated steam, the presence of the latter also preventing dissociation of the oil, which if it occurred would be followed by a lowering of viscosity of the lubricating oil and a decrease in the amount of paraffin obtained. The distillates containing the paraffin are freed from the latter by chilling, the effect of this being to cause a separation of the waxy paraffin scales. The oils thus freed from the paraffin are important lubricants, and under this class a number of grades are known as *spindle oil*, *engine oil*, *summer dark oil*, *winter dark oil*, *cylinder oil*, *valve oil*, etc. The residue now left in the tar still is a porous mass of separated carbon, a solid decomposition product termed coke. The tar is sometimes used without further distillation for the manufacture of vaseline.

Many of the distillates obtained in the treatment of crude petroleum contain acid constituents as well as compounds which in time impart a dark color and unpleasant odor to the distillate. Raw distillates, when used for illuminating purposes, also rapidly char the wick and lose their power of being drawn upward by capillarity. It is therefore customary to purify the various fractions obtained by treatment with sulphuric acid and caustic soda, be-

fore they are marketable. The distillate, which has been first cooled to 60° F., is agitated with sulphuric acid in tall cylindrical tanks of wrought iron lined with sheet lead and known as agitators; about 1½ to 2 per cent of acid is required. The acid is then washed out with water, and a 1 per cent solution of caustic soda added, after which a second agitation takes place, followed by washing and treatment with fuller's earth, which removes much color and odor.

The residuum of Lima oil blown with air at temperatures below distillation yields asphaltic products, used in mixtures with the genuine asphalt. California oils yield a similar product by distillation.

The percentage of the various fractions yielded by different oils varies. Many Pennsylvania oils yield 8 to 10 per cent naphtha, 70 to 80 per cent refined oils, 5 to 9 per cent residuum and 5 per cent loss. In the distillation of 100 gallons of crude petroleum there are obtained, on the average, about 76 gallons of illuminating oil, 11 gallons of gasoline, benzine, and naphtha, and 3 gallons of lubricating oil, while the residuum and loss amount to 10 gallons.

Testing of Refined Oils. Refined oils are usually tested for their color, gravity, flashing and burning points, and sometimes for their behavior when cooled (cold test). The color is determinable by inspection. The gravity is a measure of the purity of the distillate. Too large a proportion of the lighter oils renders the product unsafe for illuminating purposes, while too great a percentage of the heavier oils interferes with its free-burning qualities. (For a description of the *flash test*, see OIL, *Lubricating Oils*.) The gravity test is commonly made by placing the oil in a tall jar and inserting a hydrometer marked preferably with the Baumé scale (water has a value of 10 on this scale). The temperature of oil when this test is made should be 60° F. The fire test includes the determination of the *flashing point*, i.e., the temperature to which the oil must be heated in order to produce a momentary explosion of the mixture of inflammable vapor, and of the *burning point*, i.e., the temperature to which the oil must be heated in contact with the air to take fire and burn on the surface. The burning point is commonly from 8° C. to 20° C. higher than the flashing point. Kerosene for lighting purposes should have a flashing point of not less than 110° F. and a burning point of not less than 125° F. Both the flashing point and the burning point are carefully regulated by law in most civilized countries so as to run the minimum risk from explosion. The cold test is of importance for lubricating oils and is made in order to determine the temperature at which the oil thickens or becomes cloudy. It can be made by cooling the oil in a small tube and noting the temperature at which the oil ceases to flow when the tube is inclined.

Uses. The two chief uses of the distillates from crude petroleum are for illumination and lubrication, but the various fractions in many cases have special applications. Rhigolene is used as a local anæsthetic; petroleum ether is employed as a solvent for caoutchouc, fatty oils, and plant principles, and for carbureting air in gas machines; gasoline is employed in the extraction of oil from oil seeds, in carbureting coal gas, in gasoline lamps, stoves, and internal-combustion engines. Naphthas in general are

employed as solvents for resins in varnish making and in the manufacture of oilcloth. Boulevard gas fluid is a product of 0.68 specific gravity, used in street lamps, while benzoline is a deodorized naphtha of 0.70 specific gravity. Benzine is employed for dry cleaning, as a substitute for and adulterant of turpentine for cleaning printer's type, and for dyers' and painters' use. The benzine of the *United States Pharmacopœia* has a specific gravity of 0.67-0.77 and a boiling point of 122°-144° and therefore represents a higher distillate. Astral oil and mineral sperm oil are special illuminating oils of high flashing points. Crude petroleum is much used for fuel purposes in engines. Along the Pacific coast, especially in southern California, where good coal is scarce, the locomotives consume large quantities of crude oil. Paraffin residue is placed on the market for medicinal purposes under the name of vaseline, petroleum ointment, and cosmoline. It is also used in the manufacture of chewing gum and for insulating purposes in electric work.

Production. The growth of the petroleum industry in the United States is shown in the following table, which gives the annual production at intervals from 1859 to 1910:

YEAR	Barrels
1859	2,000
1860	500,000
1865	2,497,700
1870	5,260,745
1875	10,926,045
1880	26,286,123
1885	21,558,785
1890	45,823,572
1895	52,892,276
1900	63,620,529
1905	134,717,580
1910	209,557,248
1913	248,446,230

The production of crude petroleum in the United States in 1913 amounted to 248,446,230 barrels, valued at \$237,121,388. The number of gallons of petroleum and its derivatives exported in 1914 was 2,281,611,035, valued at \$152,174,056. This went to all parts of the world, but chiefly to Europe. The greater part of the exports consists of illuminating oils. New York is the leading port of exportation, with Philadelphia second. So large has the export trade become that some countries have a large fleet of specially constructed tank steamers engaged in the oil-carrying trade. The world's production of petroleum in 1913 is shown by the following table, from which it will be observed that the United States produced 65.12 per cent of the total for that year and Russia 15.97 per cent.

	Barrels
United States	248,446,230
Russia	60,935,482
Mexico	25,606,291
Rumania	13,554,768
Dutch East Indies	11,966,857
Galicia	7,818,130
India	7,500,000
Japan	1,942,009
Peru	1,857,355
Germany	995,764
Canada	228,080
Italy	50,334
Others	517,616
Total	381,508,916

PETROLEUM JELLY. See PETROLATUM.

PETROLIA. A town of Lambton Co., Ontario, Canada, situated on a branch of the Grand Trunk and on the Michigan Central Railroad, 22 miles east by south of Port Huron (Map: Ontario, C 8). It has a business college, hospital, and two parks, is the centre of production of crude petroleum for southwest

Ontario, and in the vicinity are a large number of oil wells, with an annual output of from 15,000 to 20,000 barrels. There are two large oil refineries and manufactories of oil-well supplies, boilers, machine-shop products, wagons, automobiles, fire extinguishers, bricks and tiles, and nitroglycerine. Pop., 1901, 4315; 1911, 3518.

PETROLOGY (from Gk. *πέτρα*, *petra*, rock + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say), **PETROGRAPHY**, **LITHOLOGY** (obsolescent). The science which treats of the materials of the stony portion of the earth (the lithosphere) and of meteoritic bodies. Petrography is the purely descriptive division of the science, but in general usage it has the same scope as petrology. Petrology, or petrography, is one of the geological sciences, among which it occupies a position similar to that of mineralogy. It concerns itself chiefly with the composition (chemical and mineralogical), textures, origin, and alterations of the rocks, and its methods are chiefly those of chemistry, mineralogy, and physical optics. It is one of the newest of the sciences and may be said to have had its birth in 1862, when Sorby and Zirkel succeeded in preparing transparent rock sections and adapting the microscope to their study. By the use of the petrographic microscope, which is equipped with Nicol prisms for producing polarized light and with other means for testing their optical properties, the various minerals present in a rock section may be identified quite readily, and much may be learned regarding the conditions under which the particular rock was formed. Petrology also inquires into the chemical nature of rocks and the processes by which they may have been modified after they were once formed. In short, it makes use of all available methods for establishing the origin, relationships, and properties of the various rocks and especially with the view to their systematic classification. Some of its larger and more interesting problems are concerned with the investigation of the group of igneous rocks, which are extremely diversified and which constitute by far the greater part of the solid crust of the earth. The classification of this group after a practical plan is a work attended with great difficulty that has not yet been satisfactorily accomplished, at least no system has yet found universal acceptance. A review of the various systems that have been proposed has been made by Cross for the volume upon the *Quantitative Classification of the Igneous Rocks*, which is included in the bibliography below. For information as to the different rock classes, see IGNEOUS ROCKS, SEDIMENTARY ROCKS, METAMORPHIC ROCKS; and for a description of the individual types, see GRANITE, SYENITE, BASALT, SANDSTONE, LIMESTONE, ETC.

Daly, *Igneous Rocks and their Origin* (ib., 1914); Albert Johannsen, *Manual of Petrographic Methods* (ib., 1914).

PETRONIUS, GAIUS. A Roman voluptuary at the court of Nero, whose profligacy is said to have been of the most elaborate description. We know very little about him, but the well-known passage in Tacitus (*Ann.*, xv, 17) is generally supposed to refer to him. This Petronius, at one time proconsul of Bithynia, was subsequently appointed consul, and is said to have performed his official duties with energy and ability. He was later intrusted by his Imperial master and companion with the charge of the royal entertainments and thus obtained the title of *Arbiter Elegantiarum*. The influence which he thus acquired was the cause of his ruin. Tigellinus, another favorite of Nero, conceived a hatred of Petronius, brought false accusations against him, and succeeded in getting his whole household arrested. Petronius, seeing that his destruction was inevitable, committed suicide, 66 A.D., in a languid and graceful style, opening his veins, but every now and then bandaging them to stop the flow of blood, so that he was for a while enabled to chat with his friends and even to appear in the streets of Cumæ before he died. We are told that he wrote, sealed, and dispatched to Nero, a few hours before his death, a paper containing an account of the tyrant's crimes and flagitious deeds. Petronius is generally believed to have been the author of a very remarkable ancient romance, or satire, which has survived in part under the name of *Petroni Arbitri Satiricon*, a notable work of fiction, of which fragments and a long episode entitled *The Dinner of Trimalchio* (*Cena Trimalchionis*) were discovered at different times and published together. As a description of low life in the first century of the Christian era the work is unique, especially to students of archaeology, while to Latinists and Roman philologists it offers the only continuous example of the colloquial (i.e., plebeian) language of the time. The exaggerated picture of the vulgar society of the *nouveaux-riche* is very amusing. The scene is probably laid in Puteoli. The book is memorable as being the first picaresque novel in European literature, and the characters are drawn with great skill, while the language of the narrative is full of exquisite Latinity. It has been falsely styled Menippean, because verse is introduced in it; but this verse is, at least professedly, quoted and not a part of the text. (See **SATIRE**.) The standard text is that of Bücheler (Berlin, 1862), with a smaller edition (Berlin, 1895; last reprint, 1912). There is an edition of the *Cena* episode alone, with German translation and commentary, by Freidländer (Leipzig, 1891; rev. ed., 1906), and an edition with English introduction and commentary by Waters (Boston, 1902). All the fragments were translated into English by Kelly (London, 1856) and there are later translations of the *Cena*, with introductions, by H. T. Peck, containing a bibliography (New York, 1898; last rev., 1908), by M. D. Lowe (Cambridge, 1906), by M. J.

Ryan (London, 1905), and by Michael Heseltine (ib., 1913). For the vocabulary of Petronius, consult: Segebadé and Lommatzsch, *Lexicon Petronianum* (Leipzig, 1898); J. W. Downer, *Metaphors and Word-Plays in Petronius* (Waco, Texas, 1913); also Albert Collignon, *Etude sur Pétrone* (Paris, 1892); id., *Pétrone en France* (id., 1905); F. T. Baldwin, *The Bellum Civile of Petronius* (New York, 1911); Charles Whibley, *Studies in Frankness* (ib., 1912); Emile Thomas, *Pétrone* (3d ed., Paris, 1913); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part ii (3d ed., Munich, 1913). In Sienkiewicz's popular novel, *Quo Vadis*, Petronius is a leading character (1895).

PETROPAVLOVSK, pyë'trô-páv'lôfsk. A district town in the Territory of Akmolinsk, west Siberia, situated on the right bank of the Ishim and the Trans-Siberian Railway, 191 miles west by rail from Omsk (Map: Asia, H 3). It was founded in 1752. Tallow and leather are the chief products; there is a considerable trade in animals, animal products and manufactures, with the native tribes. Pop., 43,000, of which about 15,000 are Mohammedans.

PETROPAVLOVSK. The chief town of Kamchatka (q.v.).

PETROPOLIS, pâ-trô-pô-lês. A city in the State of Rio de Janeiro, Brazil, situated in a mountainous region about 20 miles north of the city of Rio de Janeiro. It is an attractive place, with a healthful climate, and contains a palace, a number of magnificent villas, hotels, and parks. It is the summer residence of the wealthy class of Rio de Janeiro and besides is of considerable industrial importance, having a number of cotton and silk mills. It was colonized by Germans in 1845 and still has a large German element in its population. Emperor Pedro II favored the city and made it the summer home of the court. Pop, 1913 (est.), 30,000.

PETROSINO, pët'rô-zë'nô, JOSEPH (1861-1909). An American detective, born in the Province of Salerno, Italy. He came to the United States in 1865, entered the police department of New York City in 1883, and in time became especially valuable for his skill in tracking Italian (often Sicilian) criminals. In 1905 he was appointed chief of a special squad of detectives to deal especially with black-mailers and murderers belonging to the so-called "Black Hand" associations. The zeal and success with which he carried on his work incurred the violent hatred of the members of these criminal societies, and when in Sicily in 1909 on a secret mission he was assassinated at Palermo on March 13. Petrosino received a public funeral in New York City in recognition of his service to the community.

PETROVSK, pyë'trôfsk'. Capital of a district in the Government of Saratov, Russia, 93 miles northwest of Saratov (Map: Russia, G 4). The manufacture of flour and butter is extensively carried on. There are many brick-yards. Pop., 1897, 13,200; 1910, 19,346.

PETROVSKOYE, pyë'trôf'skoi-e. A village in Russia. See BUTULINOVKA.

PETROZAVODSK, pyë'trô-zâ-vôtsk'. The capital of the Government of Olónetz, Russia, situated on the west shore of Lake Onega, about 190 miles northeast of St. Petersburg (Map: Russia, D 2). It has a Gymnasium, a theological seminary, and a famous government cannon foundry. The town grew up around an

iron foundry established in 1703 by Peter the Great. Pop., 1910, 15,420.

PETRUCCI, pà-trō'chē, OTTAVIANO DE' (1466-1539). An Italian music printer, born at Fossombrone, near Urbino (Lat. *Forum Sempronii*, from which Petrucci adopted the name Petrucci Forosempronensis). He improved the art of Hahn and Reyser to such an extent that he may almost be regarded as the inventor of printing music with movable type. The Council of Venice gave him a monopoly of his invention for 20 years (1498-1518), and from 1501 to 1511 he developed his discovery with profit to himself, but finally attempted experiments that proved too costly and so was compelled to sell his privilege and business to Amadeo Scotti and Niccolo da Rafael, after which he returned to his native town. Securing a privilege for the Papal States for a term of 15 years, he commenced work again in his home town, but with very much inferior results. Petrucci prints are exceedingly rare and are very valuable. Consult A. Vernarecci, *Ottaviano de' Petrucci* (Bologna, 1882).

PETRUCCI, PANDOLFO (?-1512). A Siennese tyrant or, more exactly, political boss. He was a poor noble by birth, but marriage to an heiress gave him money and influential connections. After four years in banishment he came back in 1487, over the city wall, with a group of armed friends, and within 10 years they had become virtually the government of the city. Petrucci's times were those when the smaller Italian states were being swallowed up by the larger, which in turn France and Spain were eager to appropriate. Petrucci, who managed to maintain the independence of the little State of Siena in the midst of such new and serious perils, was cunning and ruthless (he executed his father-in-law, who had plotted his death), but relied on diplomacy and finesse rather than force. His descendants lacked his talent and failed to make him the founder of a dynasty. Consult G. A. Pecci, *Memorie storico-critiche della Città di Siena che servono alla vita di Pandolfo Petrucci* (Siena, 1755), and U. G. Mondolfo, *Pandolfo Petrucci, signore di Siena* (ib., 1899).

PETRUCHIO, pē-trō'chi-ō or -ki-ō. The husband of Katharine in Shakespeare's *Taming of the Shrew*.

PETRUNK'EVITCH, IVAN ILITCH (1844-). A Russian statesman, born in the Government of Tchernigov. In 1868 he was elected to the district and later to the government assembly. From 1869 to 1879 he was a member of the local judiciary. In the latter year, however, as the result of his radical declarations in favor of reforms, he was banished to Tver, where he continued to take an active part in political matters. In 1886, permitted to return to the Government of Tchernigov, he was elected to the local assembly. Moving again to the Government of Tver, he resumed there his political activity, which led to his second exile. Subsequently he took a very active part in the liberation movement of 1904-06. He was vice president of the Zemstvo congresses at St. Petersburg and Moscow (1904). In 1905 he became leader in the Constitutional Democratic party and was elected to the Duma of 1906, in which he made the opening address. After the dissolution of the first Duma, he was one of the deputies to the Viborg Convention, at which, too, he made the opening address defending the course of

that famous assembly. For this he was imprisoned, together with the rest of the 160 delegates. See RUSSIA.

PETRUS CAMPANEN'SIS, or KAMPANA. See KEMPENER, PETER DE.

PETTENKOFEN, pēt'en-kō'fen, AUGUST VON (1822-89). An Austrian genre and military painter and lithographer, born in Vienna. He studied at the Vienna Academy under Kupelwieser, was a cavalry officer for five years, then devoted himself to painting and lithography. He wandered through Hungary, Germany, France, and Italy and alone among his anecdotic contemporaries observed nature and the life of the people from a purely pictorial standpoint. His art is contemplative and tender and his color delicately harmonious; in his rendering of values and treatment of light he attacked the problems solved later by Manet. His favorite subjects are men and women absorbed in toil, the common soldier, and the work horse. Excellent examples of his paintings are: "The Volunteers" and the "Ambulance Wagon," Metropolitan Museum, New York; "A Slavonic Team," New Pinakothek, Munich; "Resting Gypsies," Berlin Gallery; and "The Street Fight" and other paintings and sketches in the Vienna Modern Gallery. Pettenkofen's lithographs include many fine illustrations for military works. He was a member of the Vienna and Munich academies and was knighted in 1875.

PETTENKOFER, pēt'en-kō'fēr, MAX VON (1818-1901). A German chemist and hygienist, born in Bavaria. He studied medicine and chemistry at Munich and later under Liebig at Giessen. In 1847 he became professor of medical chemistry at Munich. His famous researches formed the foundation of the science of experimental hygiene. At his instance chairs of hygiene were founded at the Bavarian universities, and he himself accepted the professorship at Munich in 1865. He became coeditor of the *Zeitschrift für Biologie* in 1864 and was for years one of the editors of the *Archiv für Hygiene*, which he founded in 1883. In 1889 he was chosen president of the Bavarian Academy of Sciences. He is best known for his experimental researches on the ventilation of dwellings, on respiration and the metabolic assimilation of food, and on cholera. The researches on metabolism were carried out, jointly with Karl Voit, by the use of an apparatus of Pettenkofer's invention, which permits the determination of the amount of atmospheric oxygen used up by the body and the amount of carbonic acid and water vapor given off. As to cholera Pettenkofer was the first to show that the symptoms of that disease are caused by the activity of a specific germ, which may be disseminated through ground water, that the spread of the disease is dependent to a great extent on local climatic and sanitary conditions, and that infection is due largely to individual predisposition. Most of his contributions appeared in the *Zeitschrift für Biologie*. He published: *Untersuchungen über die Verbreitungsart der Cholera* (1855); *Ueber den Luftwechsel in Wohngebäuden* (1858); *Zum gegenwärtigen Stand der Cholerafrage* (1887); etc. His *Beziehungen der Luft zu Kleidung, Wohnung und Boden; Was man gegen die Cholera thun kann; Populäre Vorträge*, and other works have passed through several editions.

PETTERSEN, pēt'tēr-sēn, HJALMAR (MARIUS) (1856-). A Norwegian bibliographer

and librarian, born in Christiania and educated there at the university, in the library of which he afterward held important positions. His extensive bibliographical studies, especially in Norwegian literature, resulted in various works, the most important being *Bibliotheca Norvegica* (1899 et seq.), which in scope and minute accuracy is without parallel in Norwegian bibliographic literature of Norway. Three volumes had appeared up to 1915.

PETERSSON, pět'tér-són, SVEN OTTO (1848-). A Swedish chemist, born at Göteborg. He studied at Upsala and Wiesbaden, and in 1872 obtained the doctorate at Upsala, where he became docent in physical chemistry (1874). In 1881 he was appointed director of the chemical laboratory at the College of Stockholm and from 1884 to 1909 served as professor there. In 1902 he became director of the hydrographic-biological commission. For years he did important work in physical and inorganic chemistry and in hydrography, publishing the results in periodicals. He constructed several important instruments. In 1900 he became a member of the Nobel prize committee in chemistry.

PETTIE, pět'i, JOHN (1839-93). A Scottish genre, historical, and portrait painter, born in Edinburgh. He studied under Lauder at the Trustees' Academy in Edinburgh and after Orchardson (q.v.) was chief of the group of painters who under Lauder's influence aided powerfully in the development of modern Scottish art. In 1863 he moved to London and for a while had a studio with Orchardson. His figures are usually in the costume of the sixteenth or seventeenth century. His compositions are animated, purely pictorial in motive, and full of dramatic power; his execution is brilliant and his color rich and resonant. His works include: "A Challenge"; "The Chieftain's Candlesticks"; "What d'ye lack" (1861); "Arrest for Witchcraft" (1866, Melbourne Gallery); "The Death Warrant" (1879, Hamburg Kunsthalle); "Treason" (Sheffield Gallery); "The Vigil" (Tate Gallery, London); and "The Ultimatum" (1892). His best portraits are those of Windham as "David Garrick," of himself (Tate Gallery), and of "Sybil" (1891). He was elected to the Royal Academy in 1874. Consult the biography by Hardie (London, 1908).

PETTIGREW, JAMES BELL (1834-1908). A British physiologist, born at Roxhill, Lanarkshire, Scotland. He received his education in Glasgow and Edinburgh, graduating in medicine in 1862. From 1862 to 1868 he was assistant curator of the Hunterian Museum in London. Joining the staff of Edinburgh University in 1869, he finally became Chandos professor of anatomy and, in 1875, dean of the medical faculty. Among his works may be mentioned: *The Physiology of the Circulation in Plants, in the Lower Animals, and in Man* (1872); *Animal Locomotion, etc.* (1874), translated into German and French; and articles on "Crystals, Den-drites, and Spirals" (1901) and "Swimming and Flying" (1904), reprinted. His best-known work, *Design in Nature*, was published posthumously (3 vols., 1908). It is monumental in scope, aiming to prove "that inorganic and organic matter, and physical, vital, and mental force are not opposed to each other; that a Creator, Prime Mover, or First Cause is necessary to produce dead and living matter."

PETTIGREW, JAMES JOHNSTON (1828-63). An American soldier, born in Tyrrell Co., N. C.

He graduated at the University of North Carolina in 1847 and was appointed by President Polk assistant professor in the Naval Observatory. In 1848 he resigned, to study law. He visited Europe in 1850 and for a time acted as secretary of the Spanish Legation. In 1852 he returned to the practice of law in Charleston, S. C., and was a member of the Legislature in 1856. He joined the Sardinian army in 1858, but the armistice of Villafranca destroyed his hopes of active service. After a visit to Spain he returned to Charleston to practice law and was prominent in militia affairs. He took part on the Confederate side in the first operations of the Civil War at Castle Pinckney and Morris Island, and in May, 1861, was made colonel of the Twenty-second North Carolina Regiment. In the spring of 1862 he was promoted to brigadier general and assigned to the Peninsula. He was wounded and captured at Seven Pines (May 31) and after exchange was assigned to command a new brigade of North Carolinians at Petersburg. In the fall of 1862 he made an unsuccessful attempt to recapture Newbern, N. C., and he opposed Stoneman before Richmond early in 1863. At the battle of Gettysburg (July 1-3) his brigade, a part of Heth's division, A. P. Hill's corps, opposed the famous Iron Brigade the first day and lost one-third of its numbers. One regiment, the Twenty-sixth North Carolina, lost in killed and wounded 584 out of 820. On the third day he commanded Heth's division. In the famous charge on Cemetery Ridge this division formed the left of the assaulting force. Owing to a sharp change in the direction of the stone wall, at the Bloody Angle, which made it 80 yards farther from the Confederate lines, it has been officially shown that men of this division went at least 40 yards farther up the hill than those of Pickett's. Pettigrew's brigade had 935 men left and was commanded by a major, the only field officer left. On the retreat Pettigrew was mortally wounded by Federal cavalry at Falling Waters, July 14, and died at Bunker Hill, Va., July 17. For his part in this battle, consult *North Carolina Regiments, 1861-65*, vol. v, published by the State (1901).

PETTY, SIR WILLIAM (1623-87). An English political economist, born at Romsey in Hampshire. After studying at the Jesuit College at Caen in Normandy he returned to England and entered the royal navy. On the outbreak of the Civil War he retired to the Continent and studied at Utrecht, Amsterdam, Leyden, and Paris. He returned to England and took the degree of doctor of physic at Oxford in 1649 and was soon after appointed fellow of Brasenose College. In 1651 he became professor of anatomy and in 1652 was appointed physician general to the army in Ireland. His intimacy with Henry Cromwell and other members of the Cromwellian party involved him in the downfall of the Protectorate, but he soon won the confidence of Charles II. He was one of the founders of the Royal Society, which was incorporated in 1662. He was one of the authors of *Natural and Political Observations*, published in 1662, which was the first book on vital statistics ever written. Ten years later his *Political Anatomy of Ireland* appeared. His later works were: *Quantulumcumque Concerning Money* (1682); *Observations upon the Cities of London and Rome* (1687); and a number of *Essays in Political Arithmetick*, published between 1687 and 1690.

PETTY BAG OFFICE. An office formerly attached to the Court of Chancery in England for the care of suits for and against solicitors and officers of the court; for all judicial matters relating to statutes, recognizances, writs of *scire facias* and other prerogative writs, and to certain other matters relating to the crown. The name was derived from the ancient practice of keeping the writs and returns in a little sack or bag (*in parvâ bagâ*). A great deal of miscellaneous business was also transacted in the Petty Bag Office under the general authority of the Lord Chancellor and Master of the Rolls. When the jurisdiction of the Court of Chancery was transferred to the High Court of Justice by the Judicature Acts in 1874, the office of the clerk of the petty bag was abolished, and his duties and powers are now vested in the senior clerk of the Crown Office department of the Central Office.

PETTY-FITZMAURICE, HENRY CHARLES KEITH. See LANSDOWNE, H. C. K. PETTY-FITZMAURICE, MARQUIS OF.

PETTY FITZMAURICE, WILLIAM, EARL OF SHELburne. See SHELburne.

PETTY OFFICER. A term applied in the navy to the men of the enlisted force who are appointed to positions below the rank of warrant officer; these positions or "ratings" correspond to the noncommissioned grades of the army, but they are much more numerous. The rates of pay are from \$30 to \$70 per month. (See PAY AND ALLOWANCES, *United States Navy*.) The most capable and deserving petty officers are promoted to warrant rank as vacancies occur in the grades of boatswain, gunner, and carpenter; and, if exceptionally meritorious and well informed and they pass the necessary examinations, they may then be commissioned ensigns in the regular line of promotion, but not more than 12 may be commissioned in any one year.

PETTY SESSIONS. An English court, constituted by two or more justices of the peace or a borough magistrate, when sitting for the trial of certain minor criminal cases or for the preliminary hearing and commitment for trial of persons accused of graver crimes which can be tried only at quarter sessions. It corresponds closely to the magistrate's court, or the police court, of most American cities. The jurisdiction of the justices in petty sessions is mainly over violations of certain special acts, such as those concerning poaching, vagrancy, bastardy proceedings, absconding workmen, apprentices, poor laws, etc. One of the important functions of this court is to hear and investigate charges for all indictable offenses and to commit the accused person for trial at quarter sessions if a probable case is made out against him. The jurisdiction of petty sessions and special sessions is practically the same, except that the latter court is held only on special notice. Appeals from petty sessions are heard in the court of quarter sessions. See JUSTICE OF THE PEACE; QUARTER SESSIONS; SPECIAL SESSIONS.

PETU'NIA (Neo-Lat., from Brazilian *petun*, tobacco). A genus of plants of the family Solanaceæ, natives of South America, and during the nineteenth century introduced into cultivation in other countries for their beautiful flowers. Although naturally perennials, they are generally cultivated as garden annuals. The slightly viscid foliage emits a peculiar, often disagreeable odor, especially in the evening or during stormy weather. The common garden

petunias are mostly hybrids of *Petunia nyctaginiflora* and *Petunia violaceæ*, which themselves are not frequently cultivated. *Petunia nyctaginiflora* is a stout species with white flowers; *Petunia violaceæ*, a trailing plant with purplish violet blossoms. The number of varieties is very large and includes single and double flowered forms, plain or variegated, with innumerable variations in color from pure white to deep violet, through rose, purple, pink, and many other shades. The finest flowers are produced on deep rich soils in sunny situations. They are well adapted for beds and borders and are also grown as house and conservatory plants. Since seedlings do not come true to the parent plant, the choice varieties are propagated by cuttings. These are put in sandy soil with bottom heat in August, potted singly after they have rooted, wintered in the greenhouse, and set out in the open in late spring.

PETZOLDT, pět'sólt, JOSEPH (1862-). A German Positivist philosopher, born in Altenburg and educated at the universities of Jena, Munich, Geneva, Leipzig, and Göttingen. He taught in Berlin Gymnasiums and in 1904 became privatdozent in the Berlin-Charlottenburg School of Technology. Among his works, which show traces of the influence of Avenarius, are: *Maxima, Minima, und Oekonomie* (1891); *Einführung in die Philosophie der reinen Erfahrung* (1900-04); *Das Weltproblem* (1906).

PEUCER, poi'tsér, KASPAR (1525-1602). A German scientist and scholar, son-in-law of Melanchthon. He was born at Bautzen and studied at Wittenberg, where he was made professor of mathematics in 1554 and of medicine in 1560. But in 1574 he was removed from his position as rector of the university, because of his intimate relations with Crypto-Calvinists. After 12 years' imprisonment Peucer was freed and became court physician to the Prince of Anhalt. He wrote on astronomy, geometry, and medicine and edited some of Melanchthon's letters (1565 and 1570); his best-known work is the history from Charlemagne to Charles V, which appeared as part iii in Melanchthon's *Chronicon Carionis* (1562-65).

PEUCKER, poik'ér, KARL (1859-). A German geographer. He was born in Bojanowo, Posen, and was educated at the universities of Breslau and Berlin. After several years as a private tutor, in 1891 he went to Vienna to work for the map makers Artaria & Co. In 1910 he began to lecture in the Vienna Museum of Commerce, and in 1912 he became scientific adviser to the Scheimpflug Aërophotogrammic Institute. He published an annual, *Atlas für Handelsschulen und Akademien* (1894 et seq.); an original map of Zante (1891), with Partsch; a map of eastern Asia (1904); *Kleines Ortsalewikon von Oesterreich-Ungarn* (1904); *Physiographik* (1908); *Erste Proben einer raumtreuen Karte* (1910); *Hohenschichtenkarten* (1911); and partial maps of Italy, Germany, and Austria for the 1:200,000 aeronautical map of the world.

PEURBACH, or PEUERBACH, GEORG VON. See PURBACH.

PEUTINGER, poi'ting-ér, KONRAD (1465-1547). A German antiquary, born at Augsburg. He studied law at Padua and at 28 became syndic of his native city, which he represented in several Diets, notably that of Worms in 1521. Emperor Maximilian made him Imperial counselor. His writings on classical antiquities were

very valuable; the most important is *Inscriptiones Romanæ* (1520). He is best known as owner of the *Tabula Peutingeriana* (see PEUTINGERIAN TABLE). Consult Herberger, *Konrad Peutinger in seinem Verhältnis zu Kaiser Maximilian* (Augsburg, 1851).

PEUTINGERIAN (pū'tin-jér'i-an) **TABLE** (Lat. *Tabula Peutingeriana*). The name given to a most interesting ancient document, which exhibits the military roads of the Roman Empire and of the world known to the Romans. It is not, properly speaking, a map, no regard being paid to geographic position or the extent of countries. The great lines of road are laid down in a narrow strip, as if nearly parallel, all proceeding from Rome as a centre; and as to rivers, all that appears is whether they cross the road from left to right or from right to left of the traveler proceeding from Rome. The Mediterranean and other seas are represented by mere narrow channels. A small house is the mark for a town; important towns and military stations are distinguished by walls and towers. Rome, Constantinople, and Antioch are each represented by a circle, within which is a human figure seated; in the case of Rome the figure is crowned. Until recently a portion of the only copy of this valuable relic of antiquity known to exist was evidently wanting, as it terminated abruptly on the west at the confines of Spain and included only the eastern parts of Britain. In the east it traces roads through India to a number of places of trade as far as the mouths of the Ganges. It is on parchment and, as described in all the publications devoted to it, 21 feet in length and about 1 foot wide. The extant document seems to be a thirteenth-century copy of an original made in the second or the third century; this original itself owed much to Agrippa's map of the world. It was found in the library of the Benedictine monastery at Tegernsee, in Upper Bavaria, in the fifteenth century, by Konrad Celtes, who bequeathed it to Konrad Peutinger of Augsburg, a zealous antiquary and one of the earliest writers on the Roman and other antiquities of Germany. Peutinger began to prepare a copy of it for publication, but died before he could accomplish his purpose, which, however, was partially executed by Mark Welser, in his *Fragmenta Tabulæ Antiquæ ex Peutingerorum Bibliotheca* (Venice, 1591). The ancient document itself remained in the hands of the Peutinger family and attracted no further notice till it was offered for sale in 1714 and purchased by Prince Eugene, who presented it to the Imperial Library of Vienna, in which it still remains. An exact copy of it was published at Vienna in 1753, with an introduction and index by F. C. von Scheyb. It was again published as an appendix to Katanetsch's *Orbis Antiquus* (Budapest, 1825), and at the request of the Academy of Munich a revised edition was published by Konrad Mannert (Leipzig, 1824). Since that time a leaf detached from the sheets forming the map has been found in the Imperial Library at Vienna. Consult: Miller's edition of the *Tabula* (Ravensburg, 1868), and Desjardins' (Paris, 1869-71); Philippi, *De Tabula Peutingeriana* (Bonn, 1876); Dettelsen, *Ursprung, Einrichtung und Bedeutung der Erdkarte Agrippas* (1906); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part i (3d ed., Munich, 1911). See Plate of MAP.

PEVERIL OF THE PEAK. A novel by Sir Walter Scott (1823). It is a story of the Popish Plot in the reign of Charles II.

PEW (OF. *pui, puy, poi, peu*, elevated place or seat, hill, mound, *puye*, elevated railed balcony or gallery, from Lat. *podium*, balcony, from Gk. *πόδιον*, dim. of *πούς*, *pous*, foot). An inclosed seat in a church, appropriated to a person or family. Such seats were in use in English churches some time before the Reformation. They were originally plain fixed benches, with partitions of wainscoting about 3 feet high and sides of the width of the seat, paneled or carved. In the later Reformation period and probably under the influence of the Puritans, who, objecting to some parts of the service which they were compelled to attend, sought means to conceal their nonconformity, pews grew into large and high inclosures, containing from two to four seats and fitted with doors, desks, and cushions. At first pews seem to have been assigned only to the patrons of churches, but gradually the system of appropriation was extended. It would appear by the common law of England that every parishioner has a right to a seat in the church, and that the churchwardens are bound to provide for each one as best they can. So, also, by the common law, the right to a pew is only a right to use it for the services of the church and at times when it is open for use, subject to the regulations of the church; and there is no right of access to it for any other purpose except repairs. Ordinarily in England, as in the United States, pews and the control of sittings are vested in the church authorities (in the Established church in England in the bishop, or ordinary; in other churches there and generally in America, in a board of trustees), subject to be let for a longer or shorter term to parishioners or other worshipers. But from an early date the courts in England recognized the right and title of individuals to specific pews which they and their ancestors had occupied from time immemorial. This prescriptive right came in course of time to be recognized as a species of real property an incorporeal hereditament, which would descend to the heirs of the owner and which might be alienated like any other property. It was however, subject to the control of the ecclesiastical authorities, who could rebuild or rearrange the pews in the church, or tear down the church and rebuild it, or sell it and build another church on the same or on another site, without the consent of the pewholders. In such cases however, by the weight of authority, a pewholder would be entitled to a pew of like character in the new edifice. However, if a church corporation is dissolved, the pewholders are entitled to have the value of their pew rights returned out of the church funds. The common law above set forth prevails in most of the United States. A few States have passed statutes expressly making pew rights real property, and in others the statutes define such rights as personal property. In most churches, however, pews are let from year to year and the pewholders merely have temporary possessory rights. Consult: G. H. F. Oliphant, *The Law of Pews in Churches and Chapels* (London, 1850); A. Heales, *History and Law of Church Seats and Pews* (London 1872); Sir R. J. Phillimore, *Ecclesiastical Law of the Church of England* (2d ed., ib., 1895) and the authorities referred to under **REAL PROPERTY**.

PEWEE (onomatopoetic name). Any of several small olive-green or brown American tyrant flycatchers (q.v.). The common pewee or phoebe bird (*Sayornis phoebe*) measures about 12 inches across the extended wings. It is brown on the back, darker on the head, with a yellowish-white breast and belly, quills brown, slightly edged with a lighter color. Its principal habitat is the Middle and Atlantic States. It comes north in April and usually hatches a brood by the middle of May and another by the first of August. In October it returns to the south, migrating at night. It placed its nest originally on a ledge of rocks or plastered it bracket-like against the surface of a mossy cliff, but now more frequently chooses a beam or rafter of a building or bridge. The nest is made of mud, grass, mosses, and the like and is lined with down and other soft materials; but these materials seem so favorable for the breeding of parasites that the second brood is often raised in a new nest. The pewee lays four to six eggs, white, rarely with a few reddish spots at the larger end. The hatching takes about 13 days, and in a few days more the young birds leave the nest. The pewee occurs as far west as eastern Nebraska. Its food consists wholly of insects, captured usually on the wing. Its plaintive note, *phæbe*, is well known. Two allied species, Say's pewee (*Sayornis sayus*) and *Sayornis nigricans*, occur in the Western States. The former is grayish brown with cinnamon belly and black tail, while the latter is blackish with a white belly.

The very familiar wood pewee (*Contopus*, or *Myiochanes*, *virgens*) measures from 10 to 11 inches across the outspread wings, with the color of the back much like that of the phoebe bird, but it has two pale grayish bands across the wings, a narrow whitish circle around the eyes, a greenish-yellow belly, and grayish throat and breast. Its flight is rapid, with sudden sweeps when darting after its insect prey, which it pursues in the shade of the orchard or woods. Its note is much slower and more plaintive than that of the phoebe and is more frequently single-syllabled. It comes north two or three weeks later than the phoebe, going as far north as New Brunswick and Nova Scotia and retreating as far south in the winter as New Granada. The nest is saddled upon the branch of a tree and is notable for the skill with which it is covered with lichens, so that it very closely resembles a natural wart on the limb. The eggs are four or five, light yellowish with reddish and lilac spots at the larger end. The pewee is very courageous, defending its nest against all intruders. Two broods are raised where the season is long enough. The Western wood pewee (*Contopus*, or *Myiochanes*, *richardsoni*), which resembles the wood pewee except in being darker and in having shorter legs, longer wings, and larger feet, is found from the sixtieth parallel of latitude to Panama and from the great plains to the Pacific.

The least pewee (*Empidonax minimus*) is a small bird, present in every village garden and roadside, and the type of a genus containing several small similar species. It makes a neat nest of hempen materials placed in the crotch of a small tree. Consult general works on American ornithology. See Plate of TYPICAL FLYCATCHERS with the article FLYCATCHER; and also the Colored Plate of EGGS OF AMERICAN SONG-BIRDS.

PEWIT. A British name for several birds having a cry more or less resembling these syllables, especially the lapwing (q.v.) and certain gulls.

PEWTER (OF. *peutre*, *peautre*, *piautre*, Fr. *peautre*, probably a variant of OF. *espeautre*, pewter, from LGer. *spialter*, Eng. *spelter*, zinc). An alloy of tin with lead, antimony, or bismuth, of which there are three common varieties: ley or common pewter, consisting of tin, 4 parts, and lead, 1 part; plate pewter, consisting of tin, 90 parts, antimony, 7, bismuth, 2, and copper, 2; and trifle pewter, consisting of tin, 79 parts, antimony, 15, and lead, 6. Pewter is a soft metal, similar in appearance to tin, but somewhat duller and darker in color. It was formerly extensively used for making plates, teapots, and other domestic utensils, but, on account of the poisonous character of the lead, prohibitory measures have been adopted by the governments of several countries, and consequently other alloys have largely taken its place. Old pewter, however, is now highly prized by collectors of antiques. Consult: A. L. Liberty, *Pewter and the Revival of its Use* (Washington, 1905); E. J. Gale, *Pewter and the Amateur Collector* (New York, 1909); C. A. Markham, *Pewter Marks and Old Pewter Ware, Domestic and Ecclesiastical* (ib., 1909).

PEYER'S (pi'érz) **GLAND.** One of the glands forming aggregations of solitary lymphoid follicles, first discovered by Johann Konrad Peyer, a Swiss anatomist (1653-1712), principally found in the ileum, the lower division of the small intestine, and connected with the function of absorption. (See DIGESTION.) The solitary glands which are not aggregated have essentially the same structure as those which make up the patches of Peyer, or Peyer's glands.

PEYOTE, pá-yó'tá (Sp., from Aztec *peyotl*, caterpillar, in allusion to the downy growth upon the root of the southern variety). The Mexican name given to several species of plants used by the Indians of the plains and central plateau to produce a peculiar kind of mental exhilaration. The practice existed among the native tribes from the Arkansas River as far south at least as the city of Mexico, and in a few places had crossed the main divide to the Pacific coast. The southern plant, to which the name was originally applied by the Aztecs, is a species of *Compositæ*, the active principle being in the root. The variety best known, and the use of which is everywhere found from about the valley of Mexico northward to the Arkansas, is a small cactus, botanically identified as *Lophophora williamsii*. The plant grows abundantly in a wild state along the Rio Grande and southward, and is gathered by the Indians, who use the dried top, called a "button." It is taken at intervals during a ceremony which lasts throughout the night. A small gourd rattle and a tiny water drum are the chief regalia. The effect is to exhilarate and intensify the imaginative faculties, producing a pleasant dreaminess, without, however, overmastering the will power or producing a disagreeable reaction later. Many observers assert that the moral tone of the users is heightened and that it effectively checks tendencies towards alcoholism. In recent years the ceremony, a peyote religion, has spread through Oklahoma and northward among the Plains tribes. The ritual has been described by A. L. Kroeber, in *Bulletin of the American Museum of Natural History*, vol. xviii. Consult

also Safford, in *Journal of Heredity*, vol. vi, no. 7.

PEYRÈRE, pà'tar', ISAAC DE LA. See **PRE-ADAMITES**.

PEYRON, pà'rôn', VITTORE AMADEO (1785-1870). An Italian philologist, born at Turin. He studied under the Abbé Valpergo di Caluso, and in 1815 succeeded him as professor of Oriental languages at Turin. He translated Thucydides into Italian, edited *Fragmenta Ciceronis Orationum* (1824) and other classical texts, and was a member both of the Turin Academy of Sciences and of the French Institute. It was he who first placed the study of Coptic upon a scientific basis by the *Lexicon Linguae Copticae* (1835; new ed., 1896), with the supplemental *Grammatica Linguae Copticae* (1841). See J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

PEYRONNET, pà'rô'nâ', CHARLES IGNACE, COUNT (1778-1854). A French politician, born at Bordeaux. As an advocate in his native town he displayed great zeal for the cause of the Bourbons during the decline of Napoleon's power. In 1815 he was made president of the Court of First Instance at Bordeaux and later became Procurator General at Bourges. In 1821 he was elected to the Chamber of Deputies and in the same year was named Minister of Justice—a post which he held till 1828. He was one of the most prominent champions of reaction during this period, his term of office being marked by the enactment of a rigorous press law (1822) and the passage of the law against sacrilege (1825). In May, 1830, he became Minister of the Interior under Polignac and in that capacity signed the famous Ordinances which brought about the July revolution (q.v.). Peyronnet fled, but was arrested at Tours and condemned to imprisonment for life on the charge of treason. He was pardoned in 1836. During his captivity he wrote *Pensées d'un prisonnier* (1834) and *Histoire des Francs* (1835).

PEYROUSE, PHILIPPE PICOT DE LA. See **LA PEYROUSE**, P. P. DE.

PÉZENAS, páz'nás'. A town in the Department of Hérault, France, on the Peyne, a branch of the Hérault, 25 miles west-southwest of Montpellier (Map: France, S., H 5). It manufactures spirits, wine, and cognac, and the prices which prevail at its weekly market of these articles are registered throughout Europe. Pop., 1901, 7073; 1911, 6940.

PEZET, pà-thât', FEDERICO ALFONSO (1859-). A Peruvian diplomat, born in London, educated in England and in the Military Academy at Lima. He served with distinction in the Peruvian-Chilean war, was wounded and taken prisoner, but was released later and returned to service. He was Spanish editor of the *Panama Star and Herald* from 1884 to 1886. Entering the Peruvian diplomatic service in 1886 as Consul at Panama, he later served in like capacity at Liverpool, London, and New York. He was chargé d'affaires and Consul General at Panama (1904-09), Envoy Extraordinary and Minister Plenipotentiary to Panama (1909), and special envoy extraordinary to Central America and Panama (1909-12). In 1912 he was named Minister to the United States. Pezet received the degree of LL.D. from Brown University in 1914. He became a member of numerous learned societies and contributed to American and European periodicals. His writings include *Peru: Its Commerce and Resources* (1893), *The Ques-*

tion of the Pacific (1901); *What the Panama Canal Means to Peru* (1911).

PEZI'ZA (Neo-Lat., corrupted from Lat. *pezica*, from Gk. *πέσις*, *pezis*, sessile mushroom). A genus of the Ascomycetes (q.v.) characterized by a cuplike ascocarp (apothecium), whose hymenial lining is brightly colored. The mycelium grows on decaying wood, humous soil, etc., and one of the best-known species is the scarlet cup, so named from its scarlet lining.

PEZZA, pèd'zà, MICHELE. See **FRA DIAVOLO**.

PFÄFERS, pfa'fêrs. A village and watering place in the Canton of Saint-Gall, Switzerland, in a deep gorge of the mountain stream Tamina, 2½ miles southwest of Ragatz (Map: Switzerland, D 2). It is 2240 feet above the sea. The water of the noted hot springs varies in temperature from 99° to 102° F., contains in small proportions carbonate of lime, chloride of sodium, and magnesia, is used for bathing, and has considerable curative qualities. The springs of Pfäfers were known as early as the eleventh century, and the present Kurhaus was erected at the beginning of the eighteenth century to replace the older buildings dating from the fifteenth and seventeenth centuries. The baths belonged formerly to the Benedictine monks and were acquired by the canton in 1838. Pop., about 600.

PFÄFF, pfäf, JOHANN FRIEDRICH (1765-1825). A German mathematician, born at Stuttgart. In 1788 he became professor of mathematics in Helmstedt, and in 1810 at Halle. He invented a method of integrating partial differential equations of the first order in any number of variables which depends on the solution of the general problem of integrating a linear homogeneous equation between the differentials. Equations of this kind are therefore called Pfaffian equations and their integration is called the Pfaffian problem.

A determinant,

$$\begin{vmatrix} a_{11} & a_{12} & \dots & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ a_{n1} & a_{n2} & \dots & \dots & a_{nn} \end{vmatrix}$$

in which $a_{ij} = -a_{ji}$, is called a *gauche*, or *skew*, determinant; if in addition $a_{11} = a_{22} = \dots = a_{nn} = 0$, it is called *gauche* or *skew symmetric*. Every such determinant of even order is the square of an integral function of its elements, which function is called a Pfaffian, it having first been discussed by Pfaff. His chief mathematical works are: *Commentatio de Orbitis et Occasibus Siderum apud Auctores Classicos Commemoratis* (1786); *Versuch einer neuen Summationsmethode* (1788); *Disquisitiones Analyticae* (1797); *Methodus Generalis Equationes Differentiarum Particularum Completi Integrandi* (Proceedings of the Berlin Academy, 1814-1815). His correspondence with Duke Karl of Württemberg, Bouterwek, and others was published in Leipzig (1853).

PFÄFFE, KONRAD DER. See **KONRAD DER PFÄFFE**.

PFAU, pfau, LUDWIG (1821-94). A German lyricist and art critic, born in Heilbronn. He studied in the universities of Tübingen and Heidelberg, edited the satirical *Eulenspiegel*, and took a prominent part in the revolt of Baden in 1848. On the suppression of the revolt, Pfau was sentenced to 22 years' imprisonment, but he escaped to Switzerland and, after spending two years in Zurich and in Bern, settled in Paris. In 1863 he returned to Stuttgart and became

editor of the *Beobachter*. His poetry is especially noted for its political satire; *Gedichte* (1846; 4th ed., 1889) and *Deutsche Sonette auf das Jahr 1850* (1849) are the most important titles. Pfau translated many French novels, among others Claude Tilliers's *Uncle Benjamin* and with Hartmann a volume of Breton folk songs (1859), but his original literary work was in the ballad and in art criticism as author of *Freie Studien* (1866), *Kunst und Gewerbestudien* (1877), and *Kunst und Kritik* (1888).

PFEFFEL, pfëf'el, GOTTLIEB KONRAD (1736-1809). A German fabulist. He was born at Kolmar and studied at Halle, where he could not finish his course because of threatening blindness. At 22 he lost his sight entirely. In 1773, with the help of his wife and the patronage of Louis XV, he founded a school for Protestants which enjoyed great success down to the Revolution. Pfeffer was employed in the council which undertook the reformation of the French educational system. His *Fabeln* (1783) follow Gellert for the most part; his complete works, including several very popular poems, as e.g., "Die Tabakspfeife," were published at Tübingen (1810-12). Consult his biography by L. B. Bernard, his great-granddaughter (Lausanne, 1866); Stöfer, *Pfeffels Verdienste um Erziehung und Schule* (Strassburg, 1878); C. Schmitt, *Zu Pfeffels 100jährigem Todestag* (ib., 1909).

PFEFFER, pfëf'ër, WILHELM (1845-). A German botanist. He was born near Cassel, studied at Göttingen (Ph.D., 1865), Marburg, Würzburg, and Berlin, and became professor of botany at Bonn (1873), at Basel (1877), at Tübingen (1878), and at Leipzig (1887). He made important contributions to botanical knowledge. His earlier work was mainly systematic and morphological, but he soon turned to plant physiology. He and Sachs stand alone as plant physiologists, both in the matter of importance of original contributions and as masterful organizers of the subject. In many phases of plant physiology Pfeffer was the pioneer and laid the broad foundations upon which the subject still stands. This is especially true of his work on osmotic pressure, one of the most thoroughly worked phases of the subject. In this connection he also laid the foundation of modern physical chemistry. From Pfeffer's data Van't Hoff later formulated the laws of osmotic pressure and showed their likeness to the laws of gas pressure. It is upon this basis that he derived his theory of dilute solutions. Pfeffer's contributions upon plasmatic membranes and irritability are scarcely less fundamental in plant physiology. His *Pflanzenphysiologie*, translated into English by A. J. Ewart (1899-1905), forms the most comprehensive treatise on the subject in the English language. His published papers are too numerous and too important to justify any attempt to select a few titles.

PFEFFERS, pfëf'ërs. A village in Switzerland. See PFÄBERS.

PFEIFFER, pfif'ër, FRANZ (1815-68). A Germanic scholar. He was born at Bettlach, Switzerland, studied at Munich, became royal librarian at Stuttgart in 1846, and in 1857 was made professor of German literature in the University of Vienna. He was one of the most important Germanists of recent times. He founded the review *Germania* and the series *Deutsche Klassiker des Mittelalters*, for which he edited

Walther von der Vogelweide (6th ed., 1880). His more valuable works are: *Der Dichter des Nibelungenlieds* (1862); *Freie Forschung* (1867); and, among many editions, *Barlaam und Josaphat* (1843), *Die deutschen Mystiker des 14. Jahrhunderts* (1845-47), an edition of the *Deutsche Ordenschronik* of Jeroschin (1854), *Marienlegenden* (new ed., 1863), and *Die Weingartner und Heidelberger Liederhandschrift* (2 vols., 1843). Consult article in *Allgemeine deutsche Biographie*, vol. xxv (Leipzig, 1887).

PFEIFFER, IDA, née REYER (1797-1858). An Austrian traveler. She was born at Vienna and began her career as a traveler by a trip to Palestine and Egypt when she was 45 years old. This expedition was succeeded by others to Scandinavia and Iceland in 1845, and in 1846-48 to Brazil, Chile, China, India, Persia, Armenia, and the Caucasus. Another journey was taken, in 1851-55, to Africa, Australia, and America, resulting in some valuable acquisitions for the Museum of Natural History at Vienna. In 1856 she set out for Madagascar, where she was imprisoned. Broken in health, she returned thence to die. Her works, which have been translated into English, include: *Journey of a Viennese to the Holy Land* (1843); *Journey to the Scandinavian North* (1846); *A Woman's Journey round the World* (1850).

PFEIFFER, RICHARD FRIEDRICH JOHANN (1858-). A German bacteriologist, born at Zduny, Posen. He studied medicine at the University of Berlin (M.D., 1880), was a surgeon in the army until 1890, and became lecturer at his alma mater in 1891 and director of the Institute for Infectious Diseases in Berlin. In 1899 he was called to Königsberg as professor of hygiene, and in 1909 to Breslau. Pfeiffer discovered the bacillus of influenza (1892) and bacteriolysis (1904), and with Kolle demonstrated antityphoid vaccination in Germany (1896). He published: *Mikrophotographischer Atlas* (1889; 2d ed., 1893), with C. Fraenkel; *Beiträge zur Protozoen Forschung* (1892); *Die Mikroorganismen* (1896), with F. G. F. W. Flügge; *Encyklopädie der Hygiene* (1902-06), with Proskauer.

PFEIL, pfil, JOACHIM FRIEDRICH, COUNT (1857-). A German explorer and colonist in Africa and New Guinea. He was born at Neurode in Silesia, studied at the Gymnasium of Göttingen, and in 1873 went to Natal. He learned the vernacular and stayed in the country four years; then (1879), after a visit to Europe, he settled in Orange Free State and with Wilson mapped the course of the Limpopo; but illness forced him to return to Germany. In 1884, having entered the employ of the Society for German Colonization, Count Pfeil went to East Africa with Peters and Jühlke, and in 1886 succeeded the latter as general manager of the company in Somaliland. This post he resigned in 1887 and entered the service of the New Guinea Company. In 1891 Pfeil became a member of the Department for Colonies, but resigned the next year. He traveled in 1892 through southwest Africa, visited Spain in 1895, Morocco in 1897-1901, the United States in 1904, East Africa in 1905, and Morocco again in 1907. His travels and explorations in the South Seas are described in his *Studien und Beobachtungen in der Südsee* (1899), and he also wrote *Vorschläge zur praktischen Kolonisation in Ostafrika* (1887); *Zur Frage der Deportation nach den deutschen Kolonien* (1900); *Warum brau-*

ohen wir Morokko? (1904); *Ein bewegtes Leben* (1911).

PFEL, MATHIEU (1863-). A German actor and theatrical manager. He was born in Cologne and made his debut there in his seventeenth year. In 1881 he went to the Victoria Theatre in Berlin and in 1882 to the Court Theatre at Dessau, to which he returned in 1886 after a year at Sigmaringen and another year in the army. In 1889 he played in St. Petersburg, in 1890 at the Berlin Schauspielhaus, and in 1892 at Breslau. Then he came to America and for some time was connected with the Irving Place Theatre in New York. From the Lessing Theatre in Berlin he went in 1901 to the Frankfurt Stadttheater. In 1905 he entered into a contract for five years as manager and actor at the Stuttgart Hoftheater, but in 1906 returned to Frankfurt. His rôles included Brutus, Götz, Macbeth, King Lear, Nathan, and Wallenstein.

PFEUFER, pfoi'fër, KARL VON (1806-69). A German physician who introduced the rational method of physical and chemical explanations for physiological or pathological conditions. He was born at Bamberg and studied medicine at Erlangen and Würzburg. After eight years of practice in Munich Pfeufer held academic positions in Zurich (1840-44), in Heidelberg (1844-52), and in Munich (1852-69). Besides his great contributions to method, which appeared in the *Zeitschrift für rationelle Medizin* (1844 et seq.), he wrote on cholera, *Ueber die Cholera-Epidemie in Mittenwalde* (1837) and *Zum Schutz wider die Cholera* (1849; 3d ed., 1854), and introduced public sanitation as a requisite in medical study.

PFISTER, pfis'tër, ALBRECHT (c.1420-c.70). A German printer, to whom the discovery of the art is sometimes wrongly attributed. It seems probable that he worked as wood engraver for Gutenberg. About 1455 he founded a press in Bamberg. There he printed Boner's *Edelstein* (1461); the *Book of the Four Histories* (Joseph, Daniel, Esther, and Ruth) (c.1462); the famous *Biblia Pauperum* (1462); and *Belial*, of the same date.

PFISTER, CHRISTIAN (1857-). A French historian, born at Bellenheim (Alsace), and educated at the lycées of Besançon and Louis le Grand and at the Ecole Normale Supérieure. He became a doctor of letters and taught at Besançon, at Nancy, and finally, as professor, at the Sorbonne. Pfister was created a Knight of the Legion of Honor. His writings include: *Etudes sur le règne de Robert le Pieux* (1885); *Le comté de Hombourg et la seigneurie de Riquewihr sous la souveraineté française* (1888); *Le duché mérovingien d'Alsace* (1892); *Catherine de Lorraine* (1898); *La fondation de la ville-neuve de Nancy* (1905); *Histoire de Nancy* (3 vols., 1909); *La Lorraine, Le Barrois et les Trois-Évêchés* (1912); *Les assemblées électorales dans le département de la Meurthe* (1912).

PFITZNER, pfits'nër, HANS (1869-). A German composer, born of German parents at Moscow. He received his first musical instruction from his father, a violinist at the Frankfurt Opera, and in 1886-90 was a pupil of Kwast and Knorr at Hoch's Conservatory. After teaching one season (1892-93) at the conservatory at Coblenz, he was for two years conductor of the opera at Mainz. In 1897 he became professor at Stern's conservatory in Berlin, in 1903-07 was first conductor at the Theater des

Westens, during the winter of 1907-08 directed the Kaim Orchestra at Munich, and then succeeded Stockhausen as director of the conservatory and general musical director at Strassburg. Because of his two music dramas, *Der arme Heinrich* (1895) and *Die Rose vom Liebesgarten* (1901), he was in certain circles proclaimed as the legitimate successor of Wagner; but neither work was able to hold the stage. However, his chamber music and vocal works with orchestra, in which he gets away from the influence of Wagner, exhibit originality and splendid attainments. His compositions include an orchestral scherzo; the ballads "Der Blumen Rache," "Herr Oluf," "Die Heinzelmännchen"; incidental music to Ibsen's *Fest auf Solhaug*, Kleist's *Küthchen von Heilbronn*, Stach's *Christelflein*; a string quartet, a piano quintet, a cello sonata, and a number of remarkable songs. Consult P. Cossmann, *Hans Pfitzner* (Munich, 1904).

PFIZER, pfiz'sër, GUSTAV (1807-90). A German lyricist and critic of the Swabian school. He was born in Stuttgart, studied at Tübingen, and in 1846 became professor at the Gymnasium in his native city. He wrote *Gedichte* (1831), *Dichtungen epischer und episch-lyrischer Gattung* (1840), and *Der Welsche und der Deutsche* (1844); translations of Bulwer and Byron; the critical work *Uhland und Rückert* (1837), and an attack on Heine which called out Heine's *Schwabenspiegel*. His poetry is more original and reflective than most of the products of the Swabian school. Among the most popular of his songs is "Meiner Heimat Berge dunkeln." Consult article in *Allgemeine deutsche Biographie*, vol. liii (Leipzig, 1907).

PFLEIDERER, pfli'dër-ër, OTTO (1839-1908). A German Protestant theologian, born at Stetten, near Canstatt. After studying theology at Tübingen he was for some time pastor at Heilbronn, and in 1870 was appointed chief pastor (*oberpfarrer*) and professor at Jena. In 1875 he was called to the chair of systematic theology at the University of Berlin. Through his lectures and writings he became known as one of the most influential representatives of liberal doctrines. His lectures in London (1885) and in Edinburgh (1894) were published in English as *Influence of the Apostle Paul on the Development of Christianity* and *The Philosophy and Development of Religion*. His other important works, in English translation, are as follows: *Paulinism* (1877); *Philosophy of Religion* (1886-88); *The Development of Theology in Germany since Kant, and its Progress in Great Britain since 1825* (original in English, 1890); *Evolution and Theology, and Other Essays* (1900); *The Early Christian Conception of Christ* (1905); *Christian Origins* (1906); *Primitive Christianity* (1906-09); *Religion and Historic Faiths* (1907); *The Development of Christianity* (1910).

PFÜGER, pfü'gër, EDUARD FRIEDRICH WILHELM (1829-1910). A German physiologist, born at Hanau. He studied at Marburg and Berlin and in 1859 became director of the Physiological Institute and professor in the University of Bonn. Pfüger made special studies on the nervous systems of lower animals and of metabolism. He and his pupils demonstrated that the oxidation of the blood, the essential work of respiration, takes place in the tissues; furthermore, he made important experiments on fertilization of eggs of different species of frogs; he also invented several physiological instru-

ments, among them the aërotonometer (1872) and the pneumonometer (1882). In 1868 he founded the famous *Archiv für die gesamte Physiologie* and he wrote, among other works, *Sensorische Funktionen des Rückenmarks der Wirbeltiere* (1853); *Ueber das Hemmungsnervensystem für die peristaltischen Bewegungen der Gedärme* (1857); *Physiologie des Elektrotonus* (1859); *Ueber die Eierstöcke der Säugethiere und des Menschen* (1863); *Untersuchungen aus dem physiologischen Laboratorium zu Bonn* (1865); *Die teleologische Mechanik der lebendigen Natur* (1877); *Ueber die Kunst der Verlängerung des Lebens* (1890); *Das Glykogen und seine Beziehungen zur Zuckerkrankheit* (1905).

PFLÜCK-HARTTUNG, pfloo'-här'tung, JULIUS VON (1848-). A German historian, best known as an authority on papal and mediæval history. He was born at Warnikow, studied at Bonn, Berlin, and Göttingen, and in 1886 became professor of history at Basel. On account of the Wohlgemuth case he resigned and went to Berlin, where in 1893 he became head of the secret state archives. He wrote: *Studien zur Geschichte Konrads II* (1876-77); *Norwegen und die deutschen Seestädte* (1887); *Acta Pontificorum Romanorum Inedita*, 748-1198 (1879-88); *Iter Italicum* (1883); in Grote's *Allgemeine Weltgeschichte* the part on the early Middle Ages (1889); *Krieg und Sieg*, 1870-71 (1895), the first of his studies of modern history; *Napoleon I., Republik und Kaisertum* (1900); *Die Bullen der Papste bis zum Ende des 12. Jahrhunderts* (1901); *Deutsche Gedenkhalle* (1906); *Weltgeschichte* (6 vols., 1907-10); *Die Papstwahlen und das Kaisertum* (1908); *Das Befreiungsjahr 1813* (1913); *Leipzig*, 1813 (1913).

PFORZHEIM, pförts'him. A town in the Grand Duchy of Baden, Germany, at the junction of the Enz, Würm, and Nagold, on the north border of the Black Forest, 16 miles southeast of Karlsruhe (Map: Germany, C 4). It has the remains of an ancient castle, formerly the residence of the margraves of Baden, a convent, and industrial and other schools. A new town hall has been erected in the market square. The Schlosskirche is a notable old structure in the Gothic and Renaissance styles, with tombs of the margraves. Pforzheim is one of the largest manufacturing centres of cheap jewelry in the world, over 22,000 workmen being employed. There are also chemical and iron works, foundries, machine shops, tanneries, and manufactures of tools, paper, and electrical apparatus. Pop., 1900, 43,097; 1910, 69,082.

PHACOPS (Neo-Lat., from Gk. φακός, *phakos*, lentil + ὤψ, *ōps*, eye, face). A genus of trilobites that furnishes several index fossils for the middle Paleozoic formations. The carapace is of oblong or elliptical form and is quite convex, with a pronounced axis and 11 thoracic segments. The head is semicircular, with its central portion or glabella large and very wide in front. The eyes are large and conspicuous and the lateral slopes of the head are steep, with their posterior corners rounded. The pygidium, or tailpiece, is large, convex, and strongly ribbed. The genus *Phacops* ranges from Silurian to Upper Devonian formations. The early European authors generally include under this generic term a number of species that are now classed under the genera *Dalmanites*, *Pterygometopus*, *Acaste*, and others. The most im-

portant species are *Phacops logani* of the American Lower Helderberg, *Phacops latifrons* of the European Devonian, and *Phacops rana*, a well-known species of the American Devonian. See TRILOBITA.

PHÆACIA (Lat., from Gk. Φαίαια, *Phaia-kia*). The country of the Phæacians, a people whom Odysseus visited in his wanderings. It was situated on the mythical island of Scheria, identified with Corcyra (Corfu), where the people had settled after having been driven out of their earlier home in Hyperia by the Cyclopes. There they led an undisturbed life of happiness, occupied with their marvelous ships, which safely traversed the sea without human guidance. Odysseus was found on the shore of the Phæacian island by the Princess Nausicaa, and hospitably received at the palace of her father, King Alcinous. This episode is described in *Odyssey*, vi-viii.

PHÆDO (Lat., from Gk. Φαίδων, *Phaidōn*) (early fourth century B.C.). A Greek philosopher, born in Elis. He was taken prisoner and brought to Athens, apparently about 400 B.C.; there he became acquainted with Socrates, who secured his ransom by one of his friends. He remained a devoted disciple of the great teacher until the latter's death, when he returned to Elis and became the founder of the Elean school (q.v.). In Athens he had been intimate, too, with Cebes and Plato. He composed dialogues, no longer extant, in the Socratic manner. Plato's dialogue which describes the death of Socrates bears Phædo's name.

PHÆDRA (Lat., from Gk. Φαίδρα, *Phaidra*). In Greek legend, the daughter of Minos (q.v.), King of Crete, and of Pasiphaë, sister of Ariadne, and wife of Theseus. Aphrodite, enraged against Hippolytus (q.v.), Phædra's stepson, for neglecting her worship, and against Phædra as being the daughter of Pasiphaë, inspired the latter with a passion for Hippolytus. On the rejection of her advances she falsely accused Hippolytus to Theseus, who prayed to his father, Poseidon, to destroy his son. Hippolytus was thrown from his chariot on the seashore and dragged upon the sands till dead. Phædra died by her own hand and Theseus learned the truth too late. This story, which seems to have been developed from the songs of Troezenian maidens to their local divinity, Hippolytus, guardian of purity, was first treated in tragedy by Euripides, in the play *Hippolytus*, whose second version has been preserved. It was also treated in a lost play by Sophocles. The Euripidean tragedy was imitated by the Roman Seneca and also by Racine, whose *Phèdre* (1677) is one of his masterpieces. Consult Euripides, *Hippolytus*, edited by Ulrich von Wilamowitz-Moellendorf (Berlin, 1891) and by J. E. Harry (Boston, 1899). Seneca's play has been translated by F. J. Miller, *The Tragedies of Seneca* (Chicago, 1907).

PHÆDRIADÆ. See DELPHI; PARNASSUS.

PHÆDRUS. A Latin fabulist. He was probably a Thracian who was carried to Rome as a slave in his childhood and brought up at the court of Augustus, who emancipated him. Under Tiberius he was exposed to great danger from the hostility of Sejanus, but lived to see that favorite's overthrow, and died at an advanced age, probably in the reign of Claudius. Five books of fables, after the manner of Æsop and called *Fabulæ Æsopice*, have been ascribed to him. Most of the fables are versifications of those of the Æsopian cycle, but many are drawn

from contemporary story. The book as we have it is a later and incomplete recension. The first edition was published at Troyes in 1596. The best later editions are those of Müller (Leipzig, 1877, with critical notes), Ramavino (Turin, 1884), and Müller (Leipzig, 1890). Consult: Hervieux, *Les fabulistes latins* (Paris, 1893-96); Bédier, *Les fabliaux* (Paris, 1893); Thiele, *Der illustrierte lateinische Æsop* (Leyden, 1905). See Æsop.

PHÆDRUS. A dialogue of Plato, in which Plato is represented walking in the woods with Phædrus and discoursing on the nature of love. The dialogue is distinguished by unusual poetic enthusiasm. The latter portion is an exposition of dialectics.

PHÆNOGAMS. See PHANEROGAMS.

PHÆOPHYCÆ (Neo-Lat. nom. pl., from Gk. *φαῖος*, *phaïos*, dusky + *φυκος*, *phykos*, seaweed), or **BROWN ALGÆ**. A group of algæ named from the color of the chromoplast, always a shade of brown, a color due to the pigment phycophæsin, which modifies or overpowers the green of the chlorophyll. The group includes the largest (kelps) and most vegetatively complex of the algæ.

The Phæophycæ are characteristically inhabitants of the colder waters of the globe, and are almost all marine, reaching their maximum development in Arctic and Antarctic oceans and along such coasts as the Pacific coast of North America, where the water for the most part is cold. The display is especially luxuriant at Cape Horn and on the rocky coasts of the North Atlantic and Pacific oceans. The brown algæ contain a large number of diverse groups, whose

(holdfast), that ends above in an expansion called the blade, which in some forms bears lateral leaflike structures. The blade is simple in the smaller forms (*Laminaria*), or perhaps split up longitudinally into segments. In many types the blade is cast off at certain periods by the development of a new one through the activity of the tissues just below the old. In other genera the blade serves as the growing region of the plant and splits off segments which take a lateral position on the stem (*Macrocystis*).

The most interesting forms on the American coast are the giant kelps of the Pacific Ocean. *Macrocystis* is reported to attain a length of 900 feet. It is easily recognized by the leaves borne on a stem about the size of a clothes line. Far more picturesque is the bladder kelp (*Nereocystis*), which consists of a flexible stalk swollen at the end into a hollow spherical float several inches in diameter. The top of the float bears long straplike leaves that extend on either side in the water and are whipped about by the wind and surf. Another interesting form is the sea palm (*Postelsia*), which grows on surf-beaten rocks and reefs and has a heavy, thick, erect stalk 12 to 18 inches high, with a thick crown of leaves that grow out and bend downward in the form of the conventional palm tree. The stalk is so tough that it may be bent over at right angles by the force of the waves without breaking. *Lessonia*, found on the coast of Chile, has stalks so heavy and thick that they have been mistaken for tree trunks when washed up on the beach. The kelps are one of the principal sources of iodine, which is obtained from their ashes, and are coming into use as a very important source of potash fertilizers.

In a very different division of the Phæophycæ are the rockweeds and gulfweeds. The former, also called wrack and bladder wrack, cover the rocks between tide marks with thick fringing growth. Most of the rockweed is *Fucus*, a form with a forkingly branched thallus, that bears swollen tips, and in some species special air bladders that serve to float the branches. The gulfweeds (*Sargassum*) have one of the most highly differentiated vegetative bodies among the algæ. The species are found in warmer waters than most brown algæ. In addition to the holdfast and branching stalk, there are delicate leaves and small berry-like air bladders on short pedicels, besides specialized portions that bear sexual organs. Certain species (as *Sargassum bacciferum*) will vegetate luxuriantly when floating in mid-ocean, thus forming the large masses of gulfweed met by ships, especially in certain warmer parts of the Atlantic.

Reproduction among Phæophycæ is made the basis of their classification into two groups—Phæosporales, characterized by the formation of zoöspores and by prevailing isogamy, and Fucales, characterized by the absence of zoöspores and by well-developed heterogamy. The sporangium is a single cell, being either a transformed vegetative cell or a special cell distinct from the vegetative body, and produces numerous laterally biciliate zoöspores. Laterally biciliate swimming cells (spores and gametes) are characteristic of Phæophycæ. In the isogamous forms (Phæosporales) the gametangia (sex organs) are many-celled, each cell producing a gamete, which resembles a very small zoöspore. Upon escaping the gametes pair and fuse and a zygospor (fertilized egg) is formed. These

FIG. 1. BROWN ALGÆ.

1, *Ectocarpus* with gametes escaping; 2, conjugation of the same, showing (a) numerous male gametes about a single female gamete, and (b) various stages of fusion; 3, *Pylæella*, with one cell functioning as a sporangium.

representatives range from microscopic forms and delicate filamentous types (Ectocarpales) to the immense coarse kelps several hundred feet long. The Laminariales (kelps, devil's aprons) generally have a stalk (stipe) attached to the rocks by a cluster of strong rootlike processes

gametangia show interesting gradations between isogamy and heterogamy. In some cases they produce both zoospores and gametes, as judged by behavior; in other cases the pairing gametes differ in size and activity, indicating incipient heterogamy. In the heterogamous forms (Fucales) the sex organs are produced in cham-

bers called conceptacles. The female organ (oogonium) of *Fucus* produces eight eggs; in other forms the number of eggs varies from four to the usual one; but in all cases the eggs are discharged before fertilization. The male organs (antheridia) are produced in great profusion, and discharge numerous biciliate sperms, which surround the floating eggs in swarms. After fertilization the egg germinates at once and produces a new rockweed.

See ALGÆ.

PHAER, fā'ēr, or **PHAYER**, THOMAS (?1510-1560). An English lawyer and translator, educated at Oxford and at Lincoln's Inn. As a lawyer he aimed to popularize legal methods. To this end he wrote two legal handbooks. Rewarded for his service by the appointment as solicitor in the court of the Welsh marches, he settled at Kilgerran in Pembrokeshire, where he passed most of his life. He also studied medicine and published a popular book called *The Regiment of Life*, an English rendering of a French work, containing Phaer's own treatise on the plague (1546). To the *Mirror of Magistrates* (1559) he contributed a poem on a legend connected with Owen Glendower. Phaer is now

remembered chiefly for his translation of Vergil's *Æneid* into English ballad metre (7 books, 1555-58; two more books, published posthumously with the first seven, 1562). The translation was completed by Thomas Twine in 1584. Vergil had been partly translated earlier, into the Scottish dialect by Gawin Douglas (q.v.), and by the Earl of Surrey (q.v.).

PHÆSTUS, fēs'tūs. The name of a city of ancient Crete (q.v.), a few miles west of Gortyna. Excavations made there by the Italians throw important light on Minoan civilization. Here was found in 1908 a clay disk stamped with hieroglyphics which have not yet been deciphered. Consult: Angelo Mosso, *The Palaces of Crete and their Builders* (New York, 1907); the article "Archæology," the paragraph on Greece, in the NEW INTERNATIONAL YEAR BOOK for 1908 (ib., 1909); C. H. and H. B. Hawes, *Crete, the Forerunner of Greece* (ib., 1909); H. R. Hall, *Ægean Archaeology* (London, 1915).

PHÆTHON (Lat., from Gk. φαῖθων, shining). In the Greek poets, a not infrequent title of Helios, the sun god. Phæthōn, in Greek legend, is also a son of Helios and the Oceanid Clymene. To prove his descent, he went to his father's palace and insisted on attempting to drive the chariot of the sun. Unable to control the fiery horses, he was carried from his course and, approaching too near the earth, wrought great damage. Whereupon the earth cried to Zeus for help, who struck down Phæthōn with a thunderbolt and flung him into the Eridanus, a mythical river, later identified with the Po. His sisters, the Heliades, found the body, and bewailed the loss until they were changed to poplars and their tears to amber, to which the rays of the sun gave its special glow. In the lost *Phæthōn* of Euripides the youth appeared as the favorite of Aphrodite, who had placed him in charge of her temple. Consult: Ovid, *Metamorphoses*, i, 750-ii, 366; Georg Knaack, "Questiones Phaethontæ," in his *Philologische Untersuchungen*, vol. viii (Berlin, 1886); Salomon Reinach, in *Revue de l'histoire des religions*, vol. lviii (Paris, 1908); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

PHAETON, fā'ē-ton. A form of carriage for pleasure driving drawn by one or two horses. The term is more often applied to a low easy carriage driven by ladies and known as a pony phaeton, although there are the mail phaeton and the spider phaeton, which are high carriages suitable for park driving, with a seat in front for the driver and a companion, and a rear seat for a groom.

PHAETON. See TROPIC BIRD.

PHAGEDENA, fāj'ē-dē'nā (ML., from Lat. *phagedæna*, from Gk. φαγέδαινα, *phagedaina*, a canker, from φαγεῖν, *phagein*, to eat). A term used in surgery to designate any obstinate and rapidly destructive form of ulceration. The process usually occurs in those whose systems are exhausted by disease and whose vitality is lowered by unhygienic surroundings. When an ulcer assumes a phagedenic character it enlarges rapidly; its edges are ragged and thin; its base is covered with an unhealthy slough; the discharge is thin, reddish, and offensive, and around the whole is a zone of red and deeply congested tissue. There is no tendency towards healing. The treatment consists in the local application of caustics or of excision, and the administration of stimulants, tonics, and nutritious food, to

gether with measures to promote the most favorable hygienic conditions. The term was formerly applied to hospital gangrene and to noma (see CANORUM ORIS).

PHAGOCYTE, fäg'ô-sit (from Gk. φαγεῖν, *phagein*, to eat + κύτος, *kytos*, hollow, cell). A microbe-destroying cell residing free in the animal system. About 1883 Metchnikoff found that the individual cells of the stomachs of sponges took in solid particles of food and digested them, and this he called intracellular digestion. This function is performed by individual, free, or wandering mesoderm cells, resembling amebæ. Such wandering cells, in the cases of many of the lower animals, ingest or absorb parts of the body which become useless or by decay harmful to the organism. Besides this these free ameboid cells can and do capture and devour foreign bodies and particles; they take up anything hard or soft which occurs in or is carried into the body; and when such cells are confronted with a large mass of food material which they cannot devour singly, they usually fuse into a plasmodium, which eats up the whole available food. Such bodies as cannot be eaten are surrounded and isolated. Led by these facts, Metchnikoff threw out the remarkable theory that inflammation in the vertebrates is due to the struggle between the white corpuscles of the blood and the disease germs within it. Thus a new importance was lent to the leucocytes or white ameboid corpuscles, viz., that they act as microbe eaters or phagocytes. Metchnikoff injected fluids containing bacteria or microbes beneath the skin of various invertebrate animals. They were soon found within the ameboid cells, and if such microbes developed spontaneously in the wounds of such animals, they were absorbed in the same manner. Kovalevsky, a few years later, made similar observations in compound ascidians. When an individual died it was attacked and absorbed by the mantle cells of the colony, which also sought to destroy incoming bacteria, as was proved by experiment. Kovalevsky concluded that the passage of the wandering cells to the surface of the epithelium is a means of protection against the intrusion of agents of disease. These discoveries and theories mark an epoch in biology in its application to medical knowledge.

Consult Iliya Metchnikoff, "Researches on the 'Intracellular Digestion' of Invertebrates," in *Quarterly Journal of Microscopical Science*, vol. xxiv (London, 1884), and id., *Leçons sur la pathologie comparée de l'inflammation, faites à l'Institut Pasteur en avril et mai 1891* (Paris, 1892).

PHAGOCYTO'SIS. See INFLAMMATION.

PHALANGER, fâ-lân'jër (Fr. *phalanger*, from *phalange*, phalanx, from Lat. *phalanx*, from Gk. φάλαγξ, line of battle, rank of soldiers, round piece of wood, joint between the fingers and toes). Any of the marsupials of the family Phalangeridae, which are characterized preëminently by having five fingers and toes, the second and third bound together. The thumb is opposable and nailless. The tail is nearly always long and prehensile. The family is divisible into four sections and includes a considerable variety of form. Thus, the true or typical phalangers include the various species of cuscus and various largish species, some arboreal and some terrestrial, besides the petaurists, or flying phalangers (q.v.; also TAGUAN), and the dormouse phalangers of the genus *Dromicia*. An-

other group contains the koala (q.v.), a third the wombat (q.v.), a fourth the aberrant little *Tarsipes* of Western Australia, which is only 7 inches long and uses its long, slender tongue to extract honey from flowers, as well as to catch the small insects which constitute most of its food. The phalangers are united with the kangaroos by descent, and are now separated from them only by the musk kangaroo (*Hypsoprymnodon*).

PHALANX (Lat. *phalanx*, from Gk. φάλαγξ, line of battle, row of soldiers, round piece of wood). The ancient Greek name for the heavy infantry in line of battle. The heavy-armed hoplites were only of service when stationed in a long straight line in close order. In the Homeric poems there are only shadowy traces of a regular line of battle, and the development of the typical Greek formation seems to have been largely the work of the Spartans during their struggles for supremacy in the Peloponnesus. As the principle of formation was the desire to present an equal line to the enemy, the depth and formation depended on circumstances. The usual depth seems to have been eight men, but Miltiades at Marathon weakened his centre in order to extend his line. (For an interesting explanation, somewhat different, of this manœuvre, consult Macan's *Herodotus*, referred to under MARATHON.) At Delium the Theban column was 25 deep. It is not until the fourth century B.C. that we find troops other than the hoplites of practical importance in deciding the Greek battles. During that century the improved equipment of the peltasts, or light-armed troops, made them able to meet the phalanx, if able to choose their ground and avoid the direct attack. Epaminondas gave a new direction to the art of war by replacing the old attack along the whole line with the decisive onset of one wing, drawn up in a heavy column (at Leuctra 50 deep), while the rest of the line in ordinary depth served to check the enemy. Philip of Macedon learned his military science at Thebes, and reorganized his army by the introduction of a regular infantry besides the hereditary cavalry of the nobles. These soldiers were armed with a small shield about 18 inches in diameter, corselets, and long spears, and fought in closer order than was usual among the Greeks. This phalanx seems to have been a mobile body, but probably Philip, and certainly Alexander, relied rather on the heavy cavalry as the offensive force, and used the phalanx to hold the main line of the enemy in check, while the cavalry crushed his wing or turned his flank. The phalanx of Alexander seems to have had pikes of different lengths, the longest being about 17 feet and of course requiring the use of both hands. Though intended to fight in line as a single mass, it was also capable of breaking into small tactical units able to manœuvre separately if the nature of the ground or the development of the battle made it desirable. The successors of Alexander gradually changed his fundamental principles and depended again upon the phalanx to decide the day. This led to even closer massing of men and increase of the length of the lances, till the mass became irresistible if unbroken, but unwieldy and utterly helpless if broken by uneven ground, as was proved in many a battle against the Roman legions. This later phalanx was regularly drawn up 16 men deep and either about 3 feet apart, body included, or only about 18 inches with shields touching, a formation

PHALANX. See INFANTRY.

PHALARIS (Lat., from Gk. Φάλαρις). A tyrant of Agrigentum in Sicily, whose rule lasted from about 570 to 549 B.C., when he was killed in a popular revolt. (Cicero, *De Officiis*, ii, 26.) He maintained himself by mercenaries, and chiefly by stratagem extended his power on all sides. The tradition, at least as old as Pindar, *Pythian Odes*, i, 185, that he gratified his savage nature by roasting persons alive in a brazen bull, has made him the universal type of the cruel tyrant. In later times, however, Phalaris was represented as a humane man and as patron of philosophy and literature. A collection of letters which bears his name represents him thus as a kindly and cultivated prince; but Bentley in his famous *Dissertation* (first published in 1690) showed that these are forgeries of the Christian era. Consult E. A. Freeman, *History of Sicily*, vol. ii (Oxford, 1891). See BENTLEY, RICHARD.

PHALARIS. See CANARY GRASS.

PHALAROPE (from Gk. φαλαρίς, *phalaris*, root + πούς, *pous*, foot). A sandpiper-like shore bird of the family Phalaropodidae, having lobate feet and a rather long bill, which is slender, weak, and straight. Phalaropes differ from sandpipers, however, in that they spend the greater part of their time in swimming on the sea, where they seek mollusks and other small marine animals for their food. They are very fearless of man and are said to be easily tamable, but the flesh is only and unpalatable. The phalaropes differ from most other birds in the remarkable relative condition of the two sexes. The females are not only larger and more brightly colored, but they do the courting, and after they have secured a mate and laid their three or four eggs they leave the male to do the incubating. Three species only are known, all inhabitants of the Northern Hemisphere and two circumpolar. Each is now made the type of its own genus. The northern phalarope (*Lobipes lobatus*) has the membrane of the toes scalloped and the bill very slender. It breeds in the Arctic regions and migrates southward on the approach of winter. The nest is a shallow depression in the ground lined with grass and moss. The eggs are olive gray or buffy white, heavily blotched with chocolate brown. Its entire length is rather less than 8 inches. The tail is short. It is a beautiful bird and remarkable for the great difference of its summer and winter plumage, the prevailing tint in winter being a delicate gray, while in summer the upper parts exhibit a fine mixture of slate gray and buff, sides and front of neck rufous, and the breast and under parts are white. The red phalarope (*Phalaropus fulicarius*) is rather larger than the northern phalarope and is, like it, very graceful in form and movements and finely

colored. The membrane of the toes is scalloped, but the bill is stouter, flattened, and has a lancet-shaped tip. The third species is Wilson's phalarope (*Steganopus tricolor*), which is an American bird, found in summer north to the Saskatchewan and in winter south to Brazil and Patagonia. It is rare in the East, but abundant in the Mississippi valley. It is the largest of the three species, being 9 inches or more in length. The toe membranes are plain and unscalloped. Consult Elliott Coues, *Birds of the Northwest* (Washington, 1874), and Turner, *Contributions to the Natural History of Alaska* (Washington, 1886). See Plate of Eggs or WATER AND GAME BIRDS.

PHALÆRUM. One of the harbors of Athens (q.v.). See PIRÆUS.

PHALLOICISM, or **PHALLISM** (from *phallic*, from Gk. φαλλικός, *phallikos*, relating to the male organ, from φαλλός, *phallos*, male organ). The worship of the generative power, as expressed most strongly by adoration of the male organ. As a cult phallicism is typical of the Oriental races, especially Semitic and Dravidian. In Europe its strongest expression is found in Greece, which was under Semitic influence, but as a phase of other worship rather than as a special cult it is native to many savage tribes of America and Asia. Under a corresponding name, *linga* worship, phallicism is still practiced by the natives of India. There are two forms of phallicism. The lower, and probably earlier, form is found when the phallos itself is worshiped as divine or is regarded as emblematic of sexual passion alone. Ordinarily in this form the phallic emblem is the mark of devotion to some deity of lust, who is not necessarily a male divinity. On the contrary, the female deity is more usual and sometimes older than the male. In the latter case we have reverence paid to the divine mothers, or female forms, of India; to the date palm, mother goddess in Arabia, etc.; in the former we find the worship of Dionysus in Greece and Siva in India. In this first form of phallicism there is no notion, or only a very vague notion, of affinity between sexual instinct and the creative power of nature. Among savages the rite in this form is scarcely more than a frankly brutal indulgence of passion; in a civilized community, where excess is frowned upon by a more refined sentiment, the indulgence tends to become secret, as in the Tantric worship of India. This Hindu phallicism, with its conventional admixture of philosophy, represents the conditions which obtained in Greece when orgies were veiled as Orphic mysteries.

In the second form the phallos serves merely as a symbol of that mysterious force which in spring renews vegetable life and awakens to fresh energy all living things, and phallicism thus refined becomes the worship of a great divine unifying and creative power. Such phallicism as this may be the religion of ascetics, like the Lingaites of India, and in this case the phallic emblem is usually twofold, as the deity is regarded as androgynous. But the two emblems, no longer realistic, are merely conventionalized shapes, which are placed in the temples of the male-female god Siva. Such was probably the phallicism of the higher minds in Greece, and to them the Orphic mysteries were a philosophical reinterpretation of the naïve form of grossly material phallicism which alone appealed to the vulgar.

Phallicism is not necessarily primitive, al-

though found in very savage communities. Among the Central Australians, e.g., there are erotic dances, but no trace of phallic worship. Finally it is to be observed that many supposed phallic survivals, such as the *swastikas* (q.v.) and upright stones, may have in reality nothing to do with phallic worship. Phallicism, however, lies at the base of various savage rites in many parts of the world, Asia, Africa, and America, and was often connected, as among the Aztecs, with higher forms of nature worship. Consult: James Fergusson, *Rude Stone Monuments* (London, 1872); G. A. Barton, *Sketch of Semitic Origins, Social and Religious* (New York, 1902); E. B. Tylor, *Primitive Culture* (4th ed., 2 vols., ib., 1903); Clifford Howard, *Sex Worship: An Exposition of the Phallic Origin of Religion* (4th ed., Chicago, 1902); Sha Rocco, *Masculine Cross and Ancient Sex Worship* (ib., 1914). See HINOUISM; LINGA.

PHALLUS. A genus of the Basidiomycetes (q.v.) which includes the so-called stinkhorns. The spore-producing body is a stout hollow stalk, bearing at its summit a caplike structure containing embedded spores. The exposed cap deliquesces into a slimy, dripping mass, with the odor of carrion, which attracts carrion flies, by whose agency the embedded spores are dispersed.

PHANARIOTS. See FANARIOTS.

PHANEROGAMS (from Gk. *phainós, phaneros*, evident + *gámos, gamos*, marriage). An old name of spermatophytes (q.v.), popularly called flowering plants. The name has often been modified to phénogams or phenogams. The name means "evident sexual reproduction," so that the term "flowering plants" is not a translation. The contrasting term is "cryptogams" (q.v.), which means "hidden sexual reproduction." The facts have contradicted the terms, for in cryptogams sexual reproduction is very evident, while in phanerogams it is concealed from ordinary observation.

PHAN'EROGLOS/SA, (Neo-Lat., from Gk. *phainós, phaneros*, evident + *γλῶσσα, glōssa*, tongue). A suborder of the Anura (q.v.), containing those frogs and toads which possess a tongue which has the shape of a round disk adherent by nearly the whole of its base and is not protrusible. This group includes the great majority of the frogs and toads of the world. Consult Hans Gadow, *Amphibia and Reptiles* (London, 1901).

PHAN'OCLES (Lat., from Gk. *φανοκλῆς, Phanoklēs*). A Greek elegiac poet of the close of the fourth century B.C. Of his life we know nothing. His poems deal with the loves of the gods for beautiful boys; the tragic vengeance in each case seems to have been particularly stressed. Apart from some merely verbal fragments, there remains of this series only one considerable piece from a poem on Orpheus's admiration for Calais, and the consequent slaying of Calais by the Thracian women (see ORPHEUS), which shows much beauty of diction and versification. It is edited in Bergk's *Anthologia Lyrica*.

PHARAOH, fā'rō or fā'rā-ō (Heb. *Phar'ōh*, Gk. *Φαραώ, Pharaō*). The Hebrew form of the Egyptian *Per'o*, used in the Bible as the general name or title of the kings of Egypt. From motives of reverence, the Egyptians avoided using the name of their sovereign and usually substituted for it some such expression as "the good god," "Horus the lord of the palace," "his

Majesty," "the King," or, especially under the New Empire, the indefinite pronoun "one." A very old designation of this nature was *Per'o*, great house (i.e., the palace). It occurs as early as the fourth dynasty, was used with special frequency in the vernacular of the New Empire, and finally, at quite a late period, became the common popular designation of the Egyptian monarchs. It is preserved in the Coptic *perro* (the King), where the *p* is mistaken for the definite article. Josephus (*Antiq.*, viii, 6, 2) correctly explains Pharaoh as meaning "King," and as late as the fourth century A.D. Horapollo seems to have known that "great house" was a synonym of "King." Consult G. M. Ebers, *Aegypten und die Bücher Moses* (Leipzig, 1868), and Cheyne and Black, *Encyclopædia Biblica*, vol. iii (London, 1902).

PHARAOH'S HEN, or PHARAOH'S CHICKEN. The small Egyptian vulture (*Neophron percnopterus*), so called because of its frequent appearance in the ancient hieroglyphs.

PHARAOH'S RAT. The Egyptian mongoose (*Herpestes ichneumon*).

PHARAOH'S SERPENTS. See SULPHOCYANIC ACID.

PHARAOH. See FARO.

PHARISEES (Gk. *Φαρισαῖοι, Pharisaioi*, from Aram. *perishaya*, pl. *perishin*, Heb. *perūshim*, the set apart, separatists, from *pārash*, to separate). A Jewish religious party. The Pharisees first emerged as a definite party when the success of the Maccabean revolt led to the foundation of a secular state, at the head of which John Hyrcanus (high priest, 135-105 B.C.) reigned as a secular prince, making alliances with other Powers. Opposition to this policy, along the line of the old spirit of separation from all things non-Jewish (see GENTILES), crystallized in the party of the Pharisees. They were essentially a religious party and used political methods only when they could not otherwise attain their ends. Their distinctive doctrines were: 1. Separation from all intercourse in common life with the mass of the people, whom they designated as the *'am hā' āres* (people of the land). This term did not include, as it had originally done, the heathen inhabitants of the land, from whom Jehovah was supposed to have commanded the Israelites to keep apart for fear of contamination (cf. Ezra ix. 1; Neh. x. 28-31); it was used by the Pharisees to designate even their orthodox fellow countrymen who were less scrupulous than themselves in the interpretation and observance of the law. Since absolute separation was impossible, they drew up elaborate rules to govern their intercourse with the mass of their fellow countrymen. They would not buy or sell in exchange with an *'am hā' āres*, though they worshiped with their countrymen in the temple and synagogue (cf. Luke xviii, 9-14). 2. Less distinctive, but held with equal intensity, was their doctrine of the strict interpretation and rigid observance of the law as a necessity to righteousness. They insisted upon both the written law (the *Torah*) and also the traditions of the elders, or the oral law. (the *Halacha*). Indeed, they made the tradition of more weight than the law (Mark vii. 8 et seq.). Their legal prescriptions were extended to the minute details of the ablution of hands and vessels, to tithes, fasts, and Sabbath observance. According to their teaching righteousness was the product of legal observance. 3. They cherished the political ideal of a restora-

tion of the kingdom of Israel, which they expected to be accomplished through the interposition of a divine act; preparation for this consummation they believed was best achieved through a strict carrying out of the law. Foreign domination they regarded as a punishment of God for the sins of the people, though they would submit to any rule, even that of a foreign conqueror, if it would establish the supreme observance of the law. (See ZEALOT.) 4. Their other doctrines, regarding the immortality of the soul, providence, and human freedom, were less peculiar and held in common with other Jews. See SADDUCEES.

The Pharisees are most familiar through their relation to Jesus of Nazareth. In spite of the fact that they cherished a strong national Messianic hope and were the producers of the apocalyptic literature which gave such passionate expression to it, they became the bitter opponents of Jesus, and that early in his ministry, developing their hostility until they compassed his death. The grounds of their enmity were many. He and his disciples mingled freely with publicans and sinners, thus violating the distinctive Pharisaic doctrine of separation from the 'am hā' āres (cf. Mark ii. 15-17). They were careless about the strict observance of fasts, ablutions, and the Sabbath (cf. Mark ii. 18-22; vii. 1-16; iii. 1-6). The teaching of Jesus concerning the Fatherhood of God was in direct opposition to the letter and spirit of Pharisaic legalism (cf. Matt. vi. vii. 7-11, 18-23; Luke xv. 11-32), while his claim of direct relationship to God was to them blasphemy (cf. John v. 18; x. 33). His interpretation of the *Torah* in the Sermon on the Mount was a repudiation of the Pharisaic principle that righteousness is the result of the strictness with which commandments affecting the external life are observed (cf. Matt. v. 17-47). The Pharisees made the religious relation one of legal compact; Jesus made it one of personal fellowship in the bond of filial trust and obedience. These two systems were utterly contradictory. This is evident in the incident of the paralytic (Mark ii. 7), where Jesus grants forgiveness of sins without any ceremonial conditions. The representatives of the one could not endure the teacher of the other. Hence the Pharisees were the most active in putting Jesus to death. At the same time it must be remembered that some of the ideas with which the Pharisees had indoctrinated the people did not a little in preparing the way for Jesus' own teaching. The hope of a Messianic reign, the belief in a resurrection and an immortal existence, the assurance of a divine providence over life and a divine control of history, even the insistence upon individual righteousness—external and material as their view point was—had made the people ready, as otherwise they would not have been, for the spiritual interpretation of these truths which was given in Jesus' message. After the destruction of Jerusalem under Titus (70 A.D.) the Pharisees survived as a party; their leading rabbis formed a body which regarded itself as the continuation of the ancient Sanhedrin; this group persisted and preserved Judaism of the stricter sort after the theocracy was really overthrown.

PHARMACEUTICAL ASSOCIATION, AMERICAN. A scientific society with its headquarters at Baltimore, Md. Its initial meeting was held in New York in 1851. The association was organized in Philadelphia in 1852 and incorporated in Washington, D. C., in 1888. Its objects are to improve the science and art of pharmacy by diffusing scientific knowledge among apothecaries and druggists, to foster pharmaceutical literature, to stimulate discovery and invention, and to encourage home production and manufacture in the several lines of drugs. It has published annual volumes of proceedings since 1851, except for the year 1861.

PHARMACOGNOSY (from Gk. *pharmakon*, *pharmakon*, drug, medicine + *γνώσις*, *gnōsis*, knowledge). See PHARMACOLOGY.

PHARMACOL'OGY (from Gk. *pharmakon*, *pharmakon*, drug, medicine + *λόγος*, *logos*, discourse, science). The science of drugs, their sources, description, nature, preparation, administration, and effects. See also MATERIA MEDICA; PHARMACOPEIA.

PHARMACOPEIA (Neo-Lat., from Gk. *φαρμακοποιία*, *pharmakopoiia*, art of preparing drugs, from *φαρμακοποιός*, *pharmakopoios*, one who prepares drugs, from *φάρμακον*, *pharmakon*, drug, medicine + *ποιεῖν*, *poiein*, to make). A term applied to various works, consisting for the most part of (1) a list of the articles of the materia medica, whether simple or compound, with their characters, and the tests for the determination of their purity, i.e., a condensed manual of pharmacology; and (2) a collection of approved receipts or prescriptions, together with the processes for articles in the materia medica, obtained by chemical operations.

The first pharmacopeia published under authority appears to have been that of the city of Nuremberg in the year 1546, prepared by Valerius Cordus, later professor at Wittenberg, who was staying for a short time at Nuremberg and had made a selection from the works of the most eminent writers on pharmacology. This municipal pharmacopeia was followed in 1564 by those of the cities of Augsburg, in 1565 of Cologne, and in 1576 of Lyons, while the first governmental pharmacopeia published was the one of Brandenburg in 1698. Before this time the books chiefly in use by apothecaries were the treatises of Dioscorides (c.50 A.D.), of Andromachus (c.75 A.D.), Rhazes's (died 932) *Continens*, Avicenna's (born 980) *Canon Medicinæ*; *De Medicinis Lavativis* and *Antidotarium* of Johannes Damascenus or Mezuë (died 1015), *Practica* of Bartholomæus (c.1050), *Ars medendi* of Copto (c.1100), the *Simples* of Serapion the

Younger (c.1225), *Antidotarium* (called *magnum*) of Nicolaus Alexandrinus (thirteenth century), and, most important of all, the *Antidotarium* (called *parvum*) of Nicolaus Praepositus of Salerno; while the so-called pharmacopœia of Gotha by Everhard van Wampen (1325) was an abridged edition of Bartholomæus' *Practica*. The *Compendium Aromatariorum* (1447) of Saladin of Ascalon was also used. Later on there appeared the pharmacopœias of Foesius (1561), Christopher Wirsung (1577), Wecker (1581), *La Pharmacopée* of Brice Bauderon (1588), and of Jean de Renou (1624), etc.

The first edition of the *Pharmacopœia* (or, more correctly speaking, of the pharmacopœia of the London College of Physicians) appeared in 1618 and was chiefly founded on the works of Mezue and Nicolaus of Salerno; Nicholas Culpeper translated the Latin version into English in 1649. Successive editions appeared in 1627, 1635, 1650, 1697, 1721, 1746, 1787, 1809, 1824, 1836, and 1851 and form an important contribution to the history of the progress of pharmacy and therapeutics during the last two centuries and a half.

The Edinburgh pharmacopœia is more modern than the London, the first edition having appeared in 1722, while the Dublin pharmacopœia does not date farther back than 1807. The latest editions of these works appeared in the years 1841 and 1850 respectively.

Until the Medical Act passed in 1858, the right of publishing the pharmacopœia for England, Scotland, and Ireland was vested in the colleges of physicians of London, Edinburgh, and Dublin respectively; and as these three pharmacopœias contained many important preparations, similar in name but totally different in strength, dangerous complications arose from a London prescription being made up in Edinburgh or Dublin, or vice versa. By that Act it was ordained that the general (medical) council should cause to be published a *British Pharmacopœia* which should take the place through Great Britain and Ireland of the three above-named pharmacopœias. The first edition in 1864 was followed by others in 1867, 1874, 1885, a supplement in 1890, and the latest in 1914.

In the United States the first pharmacopœia was published in Philadelphia in 1778 for the use of a portion of the American army. Another was published in 1805 by the Massachusetts Medical Society. The New York Hospital issued one for its own use in 1815; later editions, like those of similar institutions, being known as the *Formulary* and consisting of classified collections of prescriptions. The Medical Society of the County of New York in 1818 took measures for holding a convention of delegates from various State medical societies and medical colleges, which met at Washington, Jan. 1, 1820. The action taken then resulted in the appearance the same year of the first *Pharmacopœia* in the United States of America, a volume of 272 pages in Latin and English. Since the edition of 1840 the Latin has been omitted. The convention made provisions for the holding of other conventions for revision every 10 years. The convention of 1860 received delegates from the army and navy and from various colleges of pharmacy and pharmaceutical societies. But this pharmacopœia was not published by authority of the government, and its requirements were enforced by law only in certain States, until in 1907, under the provision of the National Food and

Drugs Act, it became a legal standard. Following the convention held at Washington in 1910, the ninth revised edition was to be published in 1915.

Almost every civilized country of importance has its national pharmacopœia published in its own language, the use of Latin having entirely disappeared. There exist at present about 30 pharmacopœias, of different size and contents, so that only about 150 remedies appear in all of them. Best known among these pharmacopœias are the Austrian (abbrev., P. Austr.) 1744, 1st ed. in its present form, 1774; the British (B. P.) 1627, 1st ed. 1864; the French, *Code de médicamentarius* (Codex), 1638, 1st ed. 1818; the German (P. G.), 1st ed. 1872, based principally upon the Prussian, 1698, 1st ed. 1799; the Swiss (P. Helv.), 1st ed. 1870; and the *United States Pharmacopœia* (U. S. P.), 1st ed. 1820.

It may be proper here to make the distinction between a pharmacopœia and a dispensatory. These terms have been used indiscriminately, but there is a distinction among pharmacists. A pharmacopœia is strictly a collection of recipes or instructions for making various medicinal compounds, or simple preparations, which are also made under the authority of a college or body of medical men, and are termed "official" or "pharmacopœial." A dispensatory is a book which also treats of the preparation of medicines, but it moreover contains the natural as well as the medical history of the various medicinal substances. A dispensatory, in addition to official preparations, may contain many others and be published without official authority. A dispensatory is also to a greater or less extent a treatise on *materia medica* (q.v.) or pharmacology, a branch of medical science which treats of the knowledge and action of medicines, and may either treat of the action of individual medicines or embrace the whole range of the pharmacopœia and occupy itself with the action of every article, simple or compound, either upon a healthy or a diseased subject; that is to say, it may consider the physiological as well as the therapeutic action of medicines, therapeutics (q.v.) being that branch of the science which treats of the action of drugs as *medicines* strictly speaking, or their action in disease; for this is often very different from their action on the healthy body, or their physiological action. A dispensatory is generally a combination of a pharmacopœia, a *materia medica*, and a treatise on pharmacology and on therapeutics, as far as the latter is not included in *materia medica*. The first edition of the *United States Dispensatory* was issued in 1831. It has since that time passed through many revisions and has become double its original size, till at the present time it is really an encyclopædia of therapeutics, pharmacy, and *materia medica*. Several other excellent pharmacopœias and dispensatories have been published, the *National Dispensatory* and the *American Dispensatory* being the most prominent. Though valuable, they do not occupy the official position that is filled by the pharmacopœia. New preparations are, of course, continually added to the pharmacopœias.

Consult: Bruno Hirsch, *Universal Pharmacopœie* (2d ed., Göttingen, 1902); J. Berendes, *Das Apothekewesen* (Stuttgart, 1907); Lucas and Stevens, *The Book of Pharmacopœias* (Philadelphia, 1915).

PHARMACY (OF. *farmacie*, Fr. *pharmacie*, from Gk. *pharmakela*, *pharmakeia*, use of drugs,

from *φάρμακον*, *pharmakon*, drug, medicine). That department of *materia medica* (q.v.) which treats of the collection, preparation, preservation, and dispensing of medicines. It is synonymous with pharmaceutical chemistry. Also a place where drugs are prepared, dispensed, and sold; a drugstore or an apothecary's shop.

PHARNABAZUS (Lat., from Gk. *Φαρνάβαζος*, from OPers. **Farnābazu*, having an arm of glory). A Persian, son of Pharnaces, whom he succeeded, in the reign of Darius II, as satrap of the region Dascylitis, which embraced the coast lands in northwestern Asia Minor. In 413 B.C. he espoused the cause of the Spartans, with whom he acted in concert for several years, endeavoring to drive the Athenians from the region of the Hellespont. In 408, however, changing his policy, he made a covenant of friendship and hospitality with Alcibiades and accepted terms of accommodation from the Athenians. In 396 he defeated an invading Spartan force under Agesilaus, but in the next year was himself defeated by that general. Soon after, Conon came to his assistance from Athens, and the two sailed through the Ægean Sea, driving out the Lacedæmonians from the seaport towns. Pharnabazus' final effort was with the Athenian Iphicrates in Egypt in 377 and the following years. The expedition proved unsuccessful.

PHARNACES (Gk. *Φαρνάκης*). 1. A king of Pontus (190-c.156 B.C.), son of Mithridates IV. He waged war unsuccessfully with Eumenes, King of Pergamum (q.v.), and with Ariarathes, King of Cappadocia. 2. Son of Mithridates VI the Great (q.v.), ruler of the Kingdom of Bosphorus (q.v.). In 63 B.C. he compelled his father to put an end to his life. Afterward he submitted to Pompey, who granted him the Kingdom of Bosphorus and called him ally and friend of the Roman people. In the war between Cæsar and Pompey he declared against Cæsar, but was defeated by Cæsar, near Zela in 47 B.C. The case with which the victory was won called forth Cæsar's famous message, *Veni, vidi, vici* (I came, I saw, I conquered). In 47 Pharnaces was slain by his own general, Asander, who hoped for his throne. See CRIMEA, *History*.

PHAROS (Lat., from Gk. *Φάρος*). A rocky island off the west extremity of the Egyptian coast, opposite the town of Rakotis. When Alexander chose the site of Alexandria, he connected the island with the mainland by the Heptastadium, or Seven-Furlong Mole. This made it possible to build two harbors, and on the eastern extremity of the island, at the entrance to the great harbor, Ptolemy I began the erection of a great lighthouse, which was finished under his son, Ptolemy Philadelphus, about 282 B.C. The architect was Sostratus of Onidus, and the work was reckoned among the wonders of the world. It was a lofty tower with a square base measuring about 100 feet on a side, and the light was furnished by a beacon fire on the summit. The statements that it was 400 feet high and that the light was visible for 60 miles at sea are certainly exaggerations. After this lighthouse, from the name of the island also called the Pharos, had stood for nearly 1600 years one side was thrown down by an earthquake on Aug. 7, 1303, and in 1346 it was a complete ruin. In 1478 the foundations were used for the fort Kaft Bai; the side of the great central tower of this fort has the same length as that given for the side of the old Pharos. The name Pharos was borne by at least 20

other lighthouses in the ancient classical world. Consult Von Holbach, in *Kaiserlich Deutsches Archäologisches Institut, Mittheilungen: Athenische Abtheilung*, vol. xxxiv (1909), and the article "Leuchttürme," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

PHARSA/TA, or **PHERSA/TA**. The modern name of the ancient Pharsalus (q.v.).

PHARSA/TIA. An epic poem in 10 books by Lucan, narrating the struggle between Cæsar and Pompeius. The hero is Cato.

PHARSA/TUS (Lat., from Gk. *Φάρσαλος*), now Pharsala. A Greek city of southern Thessaly, on the river Enipeus, the chief town of the District of Pharsalia. It does not appear in history until the fifth century B.C. and seems to have been one of the prosperous cities of Thessaly. In the fourth century B.C. it was the home of Daochus, who was one of the chief adherents of Philip of Macedon. It is best known from the battle of Pharsalus, fought near the city on Aug. 9, 48 B.C., between Cæsar and Pompeius. Pompeius had about 47,000 legionaries, 7000 cavalry, and a great number of light-armed auxiliaries. Cæsar had 22,000 legionaries and 1000 German and Gallic cavalry. The battle, which commenced with an attack by Pompeius' cavalry on Cæsar's right wing, ended in the turning of Pompeius' left and the destruction of his army. About 15,000 fell, and the remainder surrendered on the following day. Pharsala was one of the positions occupied by the Greeks in the disastrous war against Turkey in 1897 and after the rout of the Greeks was entered by the Turks on May 6. (Consult K. Baedeker, *Greece*, 4th Eng. ed., Leipzig, 1909.) The struggle between Cæsar and Pompeius is the theme of the *Pharsalia*, the epic poem by Lucan (q.v.).

PHARYNGITIS (Neo-Lat., from Gk. *φάρυγξ*, *pharynx*, throat, pharynx). A disease of the mucous membrane lining the pharynx, accompanied by inflammation. It is generally described as of one of two types: (1) catarrhal, (2) follicular. Catarrhal pharyngitis is the ordinary "sore throat." It is characterized by swelling and relaxation of the mucous membrane, with redness and tenderness of its surface, and occasionally ulceration with bleeding (gangrenous pharyngitis). Occasionally there is a chill, followed by fever at the beginning of the attack. The follicular variety is characterized by a pebbled surface, the elevations corresponding to the situation of the follicles in the membrane. Either variety may be preceded by a stage during which the mucous membrane is dry and the surface dull and pale. There is also a chronic dry pharyngitis. The affection is sometimes caused by inhaling irritating vapors, including tobacco smoke, or by exposure. It is often rheumatic in origin, and intestinal autointoxication is a predisposing cause. Acute pharyngitis is best treated locally by a mild, alkaline gargle and internally with aconite, phenacetin, aspirin, and salol to relieve pain and reduce fever. Purgatives and diuretics are used when indicated. Chronic pharyngitis requires first the removal of the underlying cause, e.g., autointoxication, rheumatism, smoking; and locally cleansing and astringent washes. Inflammation of the pharyngeal soft parts around the tonsil, or peritonsillitis, is described under QUINSEY (q.v.).

PHARYNGOGNATHI (Neo-Lat. nom. pl., from Gk. *φάρυγξ*, *pharynx*, throat + *γνάθος*, *gnathos*, jaw). A suborder of acanthopterous

fishes, having the lower pharyngeals fully united. It includes the Labridæ, Scaridæ, and allies. This group has aroused diversity of opinion among ichthyologists. Consult Jordan and Evermann, *Fishes of North America* (Washington, 1896).

PHARYNX (Neo-Lat., from Gk. *pharyx*, *pharynx*, throat, pharynx; connected with *pharyx*, *pharax*, cleft, *pharān*, *pharan*, to plow). The name of the combined portion of the respiratory and alimentary tracts which lies behind the nose and mouth above and in front, and the larynx and œsophagus below. It is a musculo-membranous sac situated in front of the cervical portion of the vertebral column and extending from the base of the occiput to the level of the fifth cervical vertebra, where it becomes continuous with the œsophagus (q.v.). Its length is about $4\frac{1}{2}$ inches; it is broader in its transverse than in its anteroposterior diameter, and its narrowest point is at its termination in the œsophagus. Seven openings communicate with it, viz., the two posterior nares or nostrils, at the upper and front part of the pharynx; the two Eustachian tubes, opening on the outer margins of the preceding orifices; the mouth; the larynx; and the œsophagus. Its anterior limit at the level of the mouth is marked on each side, by two musculomembranous folds, between which lie the tonsils.

The pharynx is composed of an external muscular coat; a middle fibrous coat called the pharyngeal aponeurosis, thick above where the muscular coat is absent, and gradually thinning as it descends; and a mucous coat, continuous with the mucous membrane of the mouth and nostrils. The muscular coat requires special notice. It is composed of a superior, middle, and inferior constrictor muscle on either side, together with two less important muscles, termed the stylopharyngeus and palatopharyngeus

PHARYNX.

muscles. When the food, after being sufficiently masticated and mixed with saliva, is thrown, by the action of the tongue, into the pharynx, the latter is drawn upward and dilated in different directions; the elevator muscles (the stylopharyngeus and palatopharyngeus) then relax, and the pharynx descends; and as soon as the morsel is fairly within the sphere of action of the constrictor muscles, they successively contract upon it and pass it on to the œsophagus.

The pharynx has an influence on voice modulation, especially in the production of the higher notes.

The pharynx is subject to various circulatory disturbances, to acute and chronic inflammations, diphtheria, ulceration, suppuration, and abscess. See also PALATE.

PHASE INDICATOR. See SYNCHRONIZER.

PHASE RULE. A principle of physical chemistry discovered by J. Willard Gibbs (q.v.). By "phase" is meant each of the homogeneous parts of such a system as water with ice floating on its surface; liquid water is said to form one phase of the system, ice another phase. The water vapor over the half-liquid, half-solid water is recognized as a separate phase.

No system can have more than one vapor phase, because all vapors mix to form homogeneous media. Liquids, on the other hand, frequently refuse to mix (e.g., oil and water), and so a system may have two or even three distinct liquid phases, each homogeneous liquid layer constituting a separate phase. Solids quite usually refuse to mix homogeneously, so that an apparently mixed powder really consists of distinct solid phases. A system may have a considerable number of solid phases.

Gibbs's Phase Rule correlates the number of phases that a system may have with the number of its "independent components." In a system of which the ingredients do not react chemically, the number of independent components is simply the number of substances present. If a single chemical reaction (of reasonable speed) is possible, the number of independent components is the number of substances present less one; if two chemical reactions are possible, the number of independent components equals the number of substances present less two; and so forth.

In its simplest form the phase rule affirms that the number of phases can never exceed the number of independent components by more than two. In pure water we have one single substance, and of course no reaction; hence the number of independent components is one. The phase rule therefore affirms that the number of water phases that can at any time exist together in stable equilibrium cannot possibly exceed three. We may have (at the freezing point) liquid water, ice, and water vapor together. But we could not possibly obtain two different kinds of ice (see ICE) and water and water vapor all together as a stable mass; that would make four phases, a number exceeding by three the number of independent components. If we are to get two forms of ice in equilibrium with liquid water, we must eliminate the vapor phase (by working under pressure). Consult: W. D. Bancroft, *The Phase Rule* (Ithaca, 1897); H. W. B. Roozeboom, *Die heterogenen Gleichgewichte vom Standpunkte der Phasentheorie* (Brunswick, 1901 et seq.); Alexander Findlay, *The Phase Rule* (3d ed., New York, 1911).

PHASES (ML. nom. pl., from Gk. *phásis*, *phasis*, appearance, from *pháō*, *phaein*, Skt. *bhā*, to shine). The different luminous appearances presented by the moon and several of the planets, sometimes the whole, a part, or none, of the luminous surface being seen from the earth. (For the various phases of the moon and the seasons for them, see MOON.) Mercury and Venus present to an observer on the earth similar phases to those of the moon, but require, instead of a month, periods of 116 and 584 days,

respectively, to pass through a complete series of phases. Since Mars has an orbit exterior to that of the earth, it cannot pass between it and the sun. Consequently we can never observe a crescent phase of this planet. But when in quadrature (q.v.) it is visibly gibbous, like the moon when about four days from full. The other planets show no observable phases on account of their great distances from the earth.

PHA'SIS. The ancient name of a river in Transcaucasia, now called the Rion (q.v.).

PHAT'AGIN. See MANIS.

PHAYER, THOMAS. See PHAER, THOMAS.

PHAZANIA. See FEZZAN.

PHE'AL. See JACKAL.

PHEASANT, fēz'ant (AF. *fesant*, *fesaunt*, OF., Fr. *faisan*, from Lat. *phasianus*, from Gk. *φασιανός*, *phasiant*, *φασιανός*, relating to the Phasis, from *φάσις*, *Phasis*, the name of a river in Colchis, where the pheasant has always abounded). A group of large gallinaceous birds, usually long-tailed and with brilliant coloring, of the family Phasianidae and especially of the subfamily Phasianinae. The skin around the eyes and sometimes the cheeks and specialized wattles are bare of feathers, the wings are broad and rounded, and the tail is usually elongated. Beebe in his recent study of this group has separated the pheasants from the Old World quail, partridges, and francolins by the difference in the sequence of molt of the tail feathers. This places the blood pheasants or partridges and the tragopans in the *Perdixinae*. Phasianinae proper contains 12 genera. The most brilliantly iridescent of all the groups are the Impeyans or monauls (*Lophophorus*) of the Himalaya, the bright coloring, as is usual among the pheasants, being confined to the males. The eared pheasants (*Crossoptilon*) of central and northern China number three species. The sexes are alike, and the tail feathers are long and loose-webbed and for centuries have been used to decorate the official hats of mandarins. Four genera show a rather close relationship, although connected by only the most superficial of characters, such as the compressed tail and facial wattles. The most important and generalized genus is *Gennæus*, containing the kaleegee and silver pheasants. The former are dark-colored with long flowing crests and are scattered along the base of the Himalaya. In Burma these touch the range of the lineated kaleegee (*Gennæus lineatus*) and the silver pheasants, and along the line of contact many hybrid forms have been shot and mistakenly named as good species. The Chinese silver pheasant (*Gennæus nycthemerus*) ranges across southern China. The upper plumage is white, finely penciled with black, while the lower parts are blue black. In the related tropical genera *Acomus* and *Lophura* the plumage is more brilliant, the fiery metallic red of the lower back giving these birds their name of firebacks, and the facial skin and wattles being red or blue. They live in the dense jungles of southeastern Asia and range from Siam to Borneo. In the latter island occurs the extraordinary white-tailed wattled pheasant (*Lobiophasis bulweri*), the male of which has a great fan-shaped white tail of 32 feathers and three pairs of elongated facial wattles. The female, as usual, is sombre in color, with only 28 tail feathers. Rather isolated are the four species of jungle fowl (q.v.) (*Gallus*), the koklass

pheasants (*Pucrasia*), and the cheer (*Oatreus*). The latter is represented by a single species (*Oatreus walliohi*) and lives in the western Himalaya on rocky heights among scattered deodars at elevations of 4000 feet or over. It has a long dark-brown crest, and the general color is yellowish brown, rufous, and ashy, more or less barred with black.

The name "pheasant" belongs, by etymology and usage, more particularly to the bird now so extensively naturalized in Europe and other parts of the world known as the common or the English pheasant (*Phasianus colchicus*). It is a member of the genus *Phasianus*, which includes about 18 species with numerous subspecies, and which has representatives extending straight across Asia from the Caucasus Mountains to Japan. The reeves and copper pheasants were formerly included in this genus, but without them it is much more homogeneous and typified by the disintegrated feathers of the rump, which have the appearance of hair. The Caucasus or Colchis bird was brought to Great Britain probably by the Romans and is now the standard game bird of many parts of the world, being bred and reared in enormous numbers on great preserves for the annual shooting season. This so-called "common" pheasant varies much in plumage owing to its having been crossed with several closely related forms, especially the ring-necked pheasant of eastern China. The head and neck of the cock are metallic steel blue, reflecting brown, green, and purple tints in different lights; the back and wings show a fine mixture of black, brown, light yellow and coppery red, while the breast and lower parts are golden red, each feather margined with black and reflecting tints of gold and purple. The tail is long, tapering, and barred with black. The cock bird measures about 3 feet in length, of which the tail occupies over 20 inches. The female is smaller, measuring 2 feet over all, and is pale yellowish brown, varied with darker brown, the sides of the neck tinged with vinous and greenish. See Colored Plate of Game Birds, under GROUSE.

The weight of the cocks varies from two and one half to four pounds. Pheasants are polygamous. The nest is placed on the ground, merely a hollow among dead leaves, in which the 10 or 12 olive-brown eggs are laid. On preserves, however, the eggs are taken by the gamekeepers and hatched by hens. Very young pheasants must be carefully supplied with ants, eggs, maggots, etc., and the whole difficulty of rearing them is in their earliest stage. Adult pheasants feed indiscriminately on berries, seeds, roots, young shoots of plants, worms, insects, etc. They roost in trees. The male pheasant takes flight much more readily than the female, which often remains still until the sportsman is almost upon her. The males and females do not associate together except during the breeding season, but small numbers of one sex are often found in company. The "short crow" of the males begins to be heard in March. In England and Scotland pheasant shooting legally begins on October 1 and ends on February 3. The pheasants turned out from the gamekeeper's breeding yard into a preserve are in general supplied with abundance of food during winter and come to the accustomed call as readily as any kind of poultry, so that the sportsmanship of a battue, in which they are

killed by scores or hundreds, is of the lowest kind. The pheasant exhibits a remarkable readiness to hybridize with other gallinaceous birds; a hybrid between it and the common fowl is not infrequent and is called a pero. Hybrids with the black grouse have also occurred. The flesh is excellent for eating. These pheasants have been introduced into the United States, and in many places in Oregon they are so abundant as to have become a nuisance. Other well-known wild forms are the Chinese ring-necked pheasant (*Phasianus torquatus*) and the green Japanese pheasant (*Phasianus versicolor*).

The reeves, Elliot's, copper, mikado, and Burmese bar-tailed pheasants may be grouped in the genus *Symaticus*, owing to the close resemblance of the hens and the lack of any character separating the cocks other than their multitudinous colors and patterns. The reeve (*Symaticus reevesi*) of northern China is a large bird, golden yellow in general coloration, each feather barred with black; the flanks are white with chestnut margins, and the belly is black. The tail is extremely long, the central feathers sometimes measuring over 6 feet. They are whitish, margined with buff and barred with black and chestnut. The mikado pheasant (*Symaticus mikado*) has recently been discovered in Formosa and is of a rich blue black, marked on the wings with small white spots.

Chrysolophus is the group containing the golden and Amherst pheasants. They are gorgeous birds. The former (*Chrysolophus pictus*) has the back metallic green, the underparts scarlet, the rump golden yellow, the crest amber-colored, and a magnificent ruff about the neck, orange red tipped with dark blue. Lady Amherst's pheasant (*Chrysolophus amherstiae*) has the breast metallic green and the belly white, the crest crimson with whitish tips and the nuchal ruff white margined with rich green. The tail of this bird is exceedingly long and graceful. These are hardy birds, living at moderate heights in the mountain forests of central and western China.

Owing to still another difference in tail molt four genera are segregated in the subfamily Argusianinae, inclusive of the peacock pheasants and the argus. The former comprise about a half-dozen species placed in the two genera *Chalcurus* and *Polyplectron*, while the four species of argus also present two distinct groups *Rheinardus* and *Argusianus*. The peacock pheasants are so named from the multitude of metallic ocelli or eyes on the plumage of the tail and upper parts. The true argus are perhaps the most wonderfully patterned birds in the world, the Malayan argus (*Argusianus argus*) being decorated on its greatly elongated secondary wing feathers with spots which resemble delicately tinted balls revolving in ornate sockets. This bird clears a circle in the jungle about 5 yards in diameter, in which it erects its wings and tail and displays before the female. The position assumed in courtship appears on the Plate of PHEASANTS.

Finally, we have the peacocks themselves as the last genus (*Pavo*) and subfamily (Pavoninae) of the pheasants.

Several more or less related birds are called pheasants by colonists and sportsmen in various parts of the world, e.g., the ruffed grouse in the southern United States.

PHEASANT, CHINESE SILVER. See KALEEGE **PHEASANT'S-EYE.** See ADONIS, and Plate of ACANTHUS.

PHEASANT SHELL. A gastropod mollusk of the family Turbinidae, of which the shells are much valued for their beauty, suggesting, by their gorgeous metallic tints, the plumage of pheasants; when formerly they were rare in collections, they were sometimes sold for extraordinary prices. They are now comparatively cheap and plentiful, being found in great numbers in Australia.

PHEÈDRE, fâ'dr'. A tragedy in five acts by Racine, first presented at the Hôtel de Bourgogne in 1677. The subject is taken from the *Hippolytus* of Euripides.

PHEGEUS (Lat., from Gk. Φηγεύς). An Arcadian king who gave his daughter in marriage to Alcmaeon (q.v.). The latter gave his wife the peplus and necklace of Harmonia (q.v.), but was slain by the sons of Phegeus when he attempted to recover his gifts in order to give them to his later wife, Calirrhoe. Phegeus in turn was killed by the sons of Alcmaeon.

PHEIDIAS. See PHIDIAS.

PHELAN, JAMES DUVAL (1861-). An American lawyer, mayor, and legislator, born in San Francisco. He graduated from St Ignatius College in 1881, studied law at the University of California, and in 1903 was given the degree of Ph.D. by Santa Clara College. While practicing his profession in San Francisco, he became prominent in the Democratic party. Also interested in many civic movements, president of the Mutual Savings Bank, and a director in numerous financial institutions, from 1896 to 1902 he was successful and popular as mayor. In 1900 he was given the complimentary vote of the Democratic minority for the United States Senate. In the same year he was chairman of the charter commission which secured a new reform charter for the city. After the disastrous San Francisco earthquake of 1906 he was one of the most efficient leaders in relief and reconstruction, being chairman of the committees of fifty and of forty for these purposes. In 1913 Phelan was appointed by President Wilson special commissioner to visit European countries and invite their governments to participate in the Panama-Pacific Exposition. In 1914 he was elected by a small plurality to the United States Senate. He is author of numerous articles on city improvement and municipal government.

PHELLODERM (from Gk. φελλός, *phellos*, cork + δέρμα, *derma*, skin). The plant tissue produced internally by the phellogen (q.v.). See HISTOLOGY.

PHELLOGEN (from Gk. φελλός, *phellos*, cork + -γενής, *-genēs*, producing, from γίγνεσθαι,

5. PEACOCK PHEASANT (*Polyplecton bicalcaratum*).
6. CHINESE SILVER PHEASANT (*Gennæus nyctemerus*).

gignethai, to become), or CORK CAMBIUM. A meristematic layer which usually arises in the primary cortex, giving rise externally to cork tissue and internally to phelloderm (cork cortex). Phellogen, cork, and phelloderm together are known as periderm, which is usually the conspicuous region of bark. Often a phellogen layer gradually ceases its activity, and a new one develops beneath the old. See BARK; CAMBIUM.

PHILO'NION. See COSTUME, ECCLESIASTICAL.

PHELPS, ANSON GREENE (1781-1853). An American merchant and philanthropist, born in Connecticut. He removed to Hartford at the age of 18, and established himself in the saddlery business. In 1815 he removed to New York and engaged as a merchant in tin plate and heavy metals. He acquired a large fortune, partly in real estate, and gave much of his wealth to benevolent purposes. He was president of the New York blind asylum, of the American Board of Commissioners for Foreign Missions, and of the New York branch of the Colonization Society. He bequeathed to religious and charitable institutions \$371,000 and intrusted to his son a fund of \$100,000 to dispose of in charity. Ansonia, Conn., was named in his honor.

PHELPS, AUSTIN (1820-90). An American clergyman and author. He was born at West Brookfield, Mass., was educated at the University of Pennsylvania and at Andover and Union Theological Seminaries, and the Yale Divinity School. In 1842 he became pastor of the Pine Street Congregational Church in Boston, where he remained until 1848, when he accepted the chair of sacred rhetoric at Andover Theological Seminary. He remained there for 30 years, assuming in 1869 the presidency in connection with the work of his professorship. In 1879 he resigned both positions because of ill health and thereafter lived in retirement, though freely contributing, mainly through the columns of the *Congregationalist*, to current theological discussions. He published several devotional works, and a number of volumes which were the outgrowth of his professional duties, among which may be mentioned. *Studies of the Old Testament* (1879); *The Theory of Preaching* (1881); *Men and Books* (1882); *English Style in Public Discourse* (1883); *My Study and Other Essays* (1886); *My Note-Book: Fragmentary Studies in Theology and Subjects Adjacent thereto* (1889). Consult his *Life* by his daughter, Elizabeth Stuart Phelps Ward (New York, 1891).

PHELPS, EDWARD JOHN (1822-1900). An American political leader and diplomat, born at Middlebury, Vt. He graduated at Middlebury College in 1840 and three years later was admitted to the bar in his native town. In 1845 he removed to Burlington, where he remained until 1851, when he was appointed Second Comptroller of the United States Treasury. He was then a proslavery Democrat and was afterwards a strong opponent of the Civil War. In 1870 he was a member of the Vermont Constitutional Convention. Ten years later he was elected president of the American Bar Association and in 1881 was appointed Kent professor of law at Yale. This position he held until his death. He was absent from his chair during his term as Minister to the Court of St. James's, London (1885-89). In 1893 he was appointed

senior counsel for the United States in the Berlin Sea arbitration. Among his publications are *The Life and Character of Charles Linsley*, and a posthumous collection of his *Orations and Essays* (1901), edited by J. G. McCullough, to which is prefixed a *Memoir* by J. W. Stewart.

PHELPS, ELIZABETH STUART (1815-52). An American author, the daughter of Prof. Moses Stuart of Andover Theological Seminary, wife of Prof. Austin Phelps of the same institution, and mother of Elizabeth Stuart Phelps Ward. She was born in Andover, Mass. Her tales of New England and chiefly of clerical life showed considerable promise. Her *Sunnyside* (1851, republished in Edinburgh as *Manse of Sunnyside*) was remarkably popular.

PHELPS, ELIZABETH STUART. See WARD, ELIZABETH STUART PHELPS.

PHELPS, JOHN WOLCOTT (1813-85). An American soldier, born at Guilford Centre, Vt. He graduated at West Point in 1836 and soon thereafter participated in campaigns against the Creeks and Seminoles. During the Mexican War he was engaged in several of the most important battles and in 1850 was commissioned captain of the Fourth Artillery. In 1859 he resigned from the army, but on the outbreak of the Civil War entered the Federal service as colonel of the First Vermont Volunteers. On May 17, 1861, he was commissioned brigadier general of volunteers and was sent to occupy Newport News. He took military possession of Ship Island, Miss., in November, 1861, and cooperated with Farragut in opening up the lower Mississippi in April, 1862. After the occupation of New Orleans he, on his own initiative, organized the first negro troops enrolled for service in the Federal armies. This action caused great excitement among the Confederates, whose government on Aug. 21, 1862, declared him an outlaw for having organized and armed negro slaves. The authorities at Washington were not then ready to support Phelps and ordered the troops to be disbanded and to be employed as laborers. On receiving this order General Phelps resigned, Aug. 21, 1862, and took no further part in the war. During the latter years of his life he devoted himself to an Antimasonic agitation and in 1880 was nominated for the presidency by the American party (q.v.). He wrote several books, including a *History of Madagascar* (1884) and the *Fables of Florian* (1888), and translated De la Hodde's *Sociétés secrètes de France* (1884). Consult C. H. C. Howard, *Life and Public Services of Gen. John Wolcott Phelps* (Brattleboro, Vt., 1887).

PHELPS, OLIVER (1749-1809). An American merchant and land speculator, born in Windsor, Conn. In 1788 he, with Nathaniel Gorham, contracted to buy from Massachusetts 6,000,000 acres of land in the Genesee country of New York for £300,000, to be paid in consolidated stock, a scrip issued by Massachusetts and then much depreciated. This tract was included within the charter limits of both States, and by a compromise in 1786 ownership was given to Massachusetts, while New York retained the sovereignty. The Indian title to 2,600,000 acres was extinguished and a land office was opened at Canandaigua, N. Y. The rapid rise in price of the scrip made full payment impossible, and the remainder of the original tract was surrendered to the State. In 1790 Phelps sold to Robert Morris the unsold portion of the pur-

chase, about 2,100,000 acres. In 1795, with Gideon Granger and others, he purchased from Connecticut 3,300,000 acres in Ohio, the so-called Western Reserve, but soon sold his interests and returned to Canandaigua. From 1803 to 1805 he was a member of Congress and was later a circuit judge. He took an active interest in the construction of the Erie Canal and built steamers on Cayuga Lake.

PHELPS, SAMUEL (1804-78). An English actor and manager, born and educated at Devonport. He made his first appearance in an amateur performance at the Olympic in 1825. After playing in the provinces he made his debut in London as Shylock at the Haymarket (1837), and he appeared the same season with Macready at Covent Garden. He rivaled that actor and Charles Kean in certain Shakespearean rôles, such as Lear, Othello, Macbeth, and Antony, and was equally strong in the comic characters Falstaff, Bottom, and Christopher Sly; but his most notable achievement was his joint managership of the Sadler's Wells Theatre, Islington (1844-62), where he produced more than 30 of Shakespeare's plays and those of other legitimate dramatists, with incalculable educational results both upon public taste and upon the actors employed. The undertaking was less successful financially after the retirement of Thomas Greenwood, the business partner (1860), and Phelps had abandoned it for a Drury Lane engagement by 1863. Consult Phelps and Forbes-Robertson, *Life and Life-Work of Samuel Phelps* (London, 1886).

PHELPS, WILLIAM LYON (1865-). An American English scholar, born at New Haven, Conn., and educated at Yale (A.B. 1887; Ph.D. 1891) and at Harvard (A.M. 1891). At first instructor (1892-96) in English at Yale, he was subsequently assistant professor of the English language and literature and after 1901 Lampson professor, being notably successful as a teacher. His editorial work includes: *The Novels of Samuel Richardson* (20 vols., 1902-03); *The Works of Jane Austen* (12 vols., 1906); *Marlowe's Plays* (1912). He is the author of: *The Beginnings of the English Romantic Movement* (1893); *The Pure Gold of Nineteenth Century Literature* (1907); *Essays on Modern Novelists* (1910); *Essays on Russian Novelists* (1911); *Teaching in School and College* (1912); *Essays on Books* (1914); *Robert Browning: How to Know Him* (1915). He was honored with membership in the National Institute of Arts and Letters.

PHENACETIN, fê-nâs'ê-tin (from *phenol* + *acetine*), ACETPHENETIDINE. A coal-tar derivative strongly resembling acetanilid (q.v.). It occurs as a tasteless and odorless, white, glossy, crystalline powder. It is slightly soluble in water and freely in alcohol. Its physiological action and uses are similar to those of antipyrine (q.v.). The after effects of phenacetin are, however, less marked than those following antipyrine, and it is considered safer. It is employed chiefly for the relief of pain.

PHENACODUS (Neo-Lat., from Gk. φέναξ, *phenax*, cheat + Lat. *coda*, *cauda*, tail). One of the earliest fossil ungulates, or hoofed mammals, skeletons of which are found in the Lower Eocene beds of Wyoming. It is one of the most primitive ungulates, belonging to the suborder Condylarthra, in which group the carpal and tarsal bones of the feet are wholly serial, and it presents some characters indicative of its

creodont ancestry. It was a small animal of slender build, between 5 and 6 feet long, with small head, piglike teeth, low fore quarters, hind limbs that were much more powerful than the fore limbs, and with a long, slender tail. The feet were five-toed and somewhat digitigrade, and the large size of the second, third, and fourth toes suggests that these were of more use in running than were the other two. A finely mounted skeleton of this animal is in the American Museum of Natural History in New York City.

PHENIC ACID. See CARBOLIC ACID.

PHENICIA, fê-nish'â. See PHENICIA.

PHENICIN (Fr. *phénicine*, from Gk. φοινίξ, *phoinix*, purple red), or PHENYL BROWN. A rich dye, first prepared by Roth in 1863 by the action of nitric and sulphuric acids on carbolic acid or phenol in the cold. It is a brown, amorphous powder, very soluble in alcohol, ether, and acetic acid, but only slightly soluble in water. It consists of two coloring matters, one yellow, dinitrophenol, C₆H₃(OH)(NO₂)₂, the other a brown, humus-like body of unknown composition. Phenicin was formerly much used in coloring leather.

PHENOCRYST (from Gk. φαίνω, *phainein*, to show, appear + κρύσταλλος, *kryсталlos*, crystal). The name used in petrology to designate crystal individuals in a rock that possesses more perfect boundaries and are of larger size than the remaining constituents. A rock containing such crystals is said to have a porphyritic texture. They indicate that a rock has passed through two stages of crystallization, the first leading to the formation of the phenocryst and the second to the formation of the ground mass. The first stage generally takes place while the rock mass exists in a molten condition within the earth; while the ground mass is the result of rapid cooling after the rock has been erupted.

PHENOGAMS. See PHANEROGAMS.

PHENOL, fê'nôl. See CARBOLIC ACID; PHENOLS.

PHENOL'OGY (abbrev. of *phenomenology*, from Gk. φαινόμενον, *phainomenon*, phenomenon, nom. sing. neut. of pres. p. mid. of φαίνω, *phainein*, to appear + -λογία, -logia, account, from λέγω, *legein*, to say). That branch of ecology in which attempts are made to determine the influence of climatic factors on plant life by means of meteorological observations. See DISTRIBUTION OF PLANTS.

PHENOLPHTHALEIN, -thâl'ê-in, C₉H₆[C(C₆H₄OH)₂][CO]O. A crystalline chemical substance prepared by heating carbolic acid (phenol) with the anhydride of phthalic acid in the presence of strong sulphuric acid. It is insoluble in water, but dissolves readily in alcohol, producing a colorless solution. With alkalis phenolphthalein forms beautifully red-colored salts, and therefore the addition of a few drops of alcoholic phenolphthalein to a solution containing even a trace of free alkali produces a distinct red coloration—a fact utilized for the detection of alkalinity and also for the quantitative determination of the amount of alkali in solutions. When an alkaline solution colored red by phenolphthalein is acidified, the color disappears. (See LITMUS.) Phenolphthalein is also extensively used as a laxative, under various trade names. But while at one time believed to be an ideal, in the sense of perfectly harmless, laxative, it is now known to

be capable of producing faintness and other symptoms of poisoning.

PHENOLS (Fr. *phénol*, from Gk. *phálein*, *phainein*, to appear). An interesting class of carbon compounds, the simplest of which is ordinary carboic acid (q.v.). The phenols are derivatives of benzene, and they are characterized chemically by one or more hydroxyl groups attached immediately to the so-called benzene nucleus (a ring made up of six atoms of carbon). The phenols are distinguished from the alcohols (q.v.) by having the properties of acids. Thus, unlike the alcohols, they combine with metallic hydroxides to form phenates (the alcohols form alcoholates with the alkali metals themselves, but not usually with their hydroxides). On the other hand, they are distinguished from acids by containing no carboxyl group (COOH) and by being weaker than the weakest carboxylic acid known, viz., carbonic acid. Their weakness as acids may be readily demonstrated by passing a current of carbonic acid gas into a solution containing, say, phenate of sodium; the carbonic acid will then take the sodium away from the phenol, sodium carbonate will be formed, and the phenol will be set free. Among the characteristic reactions of the phenols must also be mentioned the fact that they all give colorations with ferric chloride. The principle on which fatty alcohols, phenals, and aromatic alcohols are classified and distinguished from one another symbolically may be seen from the following formulas showing simple representatives of the three classes in question

CH_3OH	$\text{C}_6\text{H}_5\text{OH}$	$\text{C}_6\text{H}_5 \cdot \text{CH}_2 \cdot \text{OH}$
Methyl alcohol	Carboic acid	Benzyl alcohol
(fatty)	(a phenol)	(aromatic)

The distinction between the fatty alcohol and the other two substances is in the hydrocarbon radicals which hold the hydroxyl groups; the distinction between the phenol and the aromatic alcohol is in the fact that in the former the hydroxyl group is attached directly to one of the atoms of the group C_6 , while in the latter the hydroxyl is linked to the C_6 ring by the group CH_2 . Naphthalene (q.v.), anthracene (q.v.), and other polycyclic substances yield derivatives analogous to the phenols yielded by benzene. See ACIDS.

PHENOMENON. A philosophical term meaning that which appears. See NOUMENON.

PHENYL (from *phenol*), C_6H_5 . A chemical radical, i.e., a group of atoms possessed in common by the molecules of different compounds, but incapable of independent existence. See CARBON COMPOUNDS; VALENCE.

PHENYLAMINE. See ANILINE.

PHENYLENE BROWN. See COAL-TAR COLORS.

PHÉRÆ (Lat., from Gk. *Φερά*). An ancient city of southeastern Thessaly, about 10 miles west of its harbor, Pagasæ, where in recent years a remarkable series of painted late Greek grave stelæ have been found, at the head of the Pagasæan Gulf, in Greek legend, the ancient royal seat of Admetus and Alcestis. In the early part of the fourth century B.C. the power was in the hands of Jason, son of Lycophron, who had become tyrant about the close of the Peloponnesian War. Jason was a man of marked ability, and by B.C. 374 had forced his recognition as chief of the Thessalians and began to play an important part in the affairs of Greece, while it was said that he meditated

the invasion of Persia. He was assassinated in 370 B.C. His nephew, Alexander, succeeded to his rule, but was soon confined by the Thebans to the tyranny over Phæræ. After displaying the utmost cruelty for 11 years, he was finally murdered by his wife's brothers, 367 B.C. Five years later Phæræ, with the rest of Thessaly, became subject to Philip of Macedon. At Phæræ there was a mineral spring named Hyperia, famous for its healing virtues, which still flows in the centre of the modern village of Veles-tino. Consult Meineke, *Strabonis Geographica* (1904).

PHERECRATES, fê-rêk'ra-têz (Lat., from Gk. *Φερεκράτης*, *Pherekratês*). One of the most eminent writers of the Old Attic Comedy; a contemporary of Cratinus, Crates, Eupolis, Plato, and Aristophanes. He invented the Pherecrætean metre (see LOGÆDIC VERSE, II, 2), which is frequently used in the choruses of the Greek tragedies and in Horace. A few fragments and the titles of 18 of his plays are extant. Consult A. Meineke, *Fragmenta Comicorum Græcorum* (Berlin, 1839, 1855), and Th. Kock, *Comicorum Atticorum Fragmenta* (Leipzig, 1880). Among the ancients he was famed for his wealth of invention and the purity of his Attic Greek.

PHERECYDES, fê-rê-sî'dêz (Lat., from Gk. *Φερεκύδης*, *Pherekydês*). 1. One of the earliest writers of Greek prose. He was born in the island of Syros and flourished in the sixth century B.C. He composed a cosmogonic work on nature and the gods, entitled *Περὶ φύσεως* (*Pentemychos*), because according to its doctrine, five elements made up the universe—ether, fire, air, water, and earth. That he taught Pythagoras his doctrine of the transmigration of souls may well be doubted. A fragment of Pherecydes on the sacred marriage of Zeus and Chthonia has recently been discovered in Egypt; it is published by Grenfell, p. 22, *New Classical Fragments* (Oxford, 1897). The fragments formerly known, together with those of the following author, are published by Müller, *Fragmenta Historicorum Græcorum* (Paris, 1850). Consult H. Diels, *Fragmente der Vorsokratiker* (1903), and Theodor Gomperz, *Greek Thinkers*, vol. i (Eng. trans. by L. Magnus, New York, 1905).

2. A logographer and native of Leros, who flourished in the middle of the fifth century B.C. He spent the greater part of his life at Athens, where he wrote his *Genealogies* or *Autochthonês* (*Γενεαλογίαι* or *Αὐτόχθονες*), a work of ten books in the Ionic dialect, on the descent of the gods and the noble Greek families. The extant fragments are published as indicated under 1 above. Consult, also, Luetke, *Pherecydæa* (Göttingen, 1893), and H. Bertsch, *Pherekydeische Studien* (1898). For both 1 and 2, consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (5th ed., Munich, 1908).

PHÉRÉTIMA. Wife of Battus III and mother of Arcesilaus III, kings of Cyrene. To avenge the murder of her son by the Barcæans she induced the Persian Viceroy in Egypt to attack their city. After the city fell she caused those chiefly responsible for her son's death to be impaled and the breasts of their wives to be cut off.

PHERSA'LA, or **PHARSALA.** The modern name of the Greek city Pharsalus (q.v.).

PHI BETA KAPPA. An honorary college fraternity, the oldest of the Greek-letter frater-

nities. It was organized at William and Mary College in Williamsburg, Va., Dec. 5, 1776, as a secret social club, and literary society and chapters were established at Yale (1780), at Harvard (1781), and then at Dartmouth (1787). Subsequently, in response to the agitation against secret fraternities, its secret character was abandoned by the Harvard chapter, and this lead the chapters at Yale and Dartmouth soon followed. For nearly half a century it was the only college fraternity in the United States that was devoted to literature and philosophy, and Phi Beta Kappa days at commencements became noteworthy by orations and poems which had an important influence on the early literature of the United States.

There were, in 1915, 86 chapters in as many different colleges, as follows (in addition to the four already mentioned): Union (1817), Bowdoin (1825), Brown (1830), Trinity (1845), Wesleyan (1845), Western Reserve (1847), Vermont (1848), Alabama (1851), Amherst (1853), Kenyon (1858), New York University (1858), Marietta (1860), Williams (1864), College of the City of New York (1867), Middlebury (1868), Rutgers (1869), Columbia (1869), Hamilton (1870), Hobart (1871), Colgate (1878), Cornell (1882), Dickinson (1887), Lehigh (1887), Rochester (1887), De Pauw (1889), Northwestern (1890), Kansas (1890), Lafayette (1890), Tufts (1892), Pennsylvania (1892), Minnesota (1892), Iowa (1895), Johns Hopkins (1895), Nebraska (1895), Colby (1896), Syracuse (1896), Swarthmore (1896), Wabash (1898), California (1898), Haverford (1898), Vassar (1898), Wisconsin (1899), Boston (1899), Cincinnati (1899), Princeton (1899), St. Lawrence (1899), Chicago (1899), Vanderbilt (1901), Missouri (1901), Allegheny (1902), Colorado University (1904), Smith (1904), Stanford (1904), North Carolina (1904), Colorado College (1904), Wellesley (1904), Ohio State (1904), Mount Holyoke (1905), Texas (1905), Goucher (1905), Oberlin (1907), Ohio Wesleyan (1907), Illinois (1907), Michigan (1907), Franklin and Marshall (1908), Grinnell (1908), Virginia (1909), Tulane (1909), West Virginia (1910), Denison (1911), Indiana (1911), Washington and Lee (1911), Miami (1911), Beloit (1911), Lawrence (1914), Pomona (1914), Georgia (1914), Carleton (1914), Washington State (1914), Radcliffe (1914), Washington University (1914), and North Dakota (1914).

Women were not admitted until 1875, and in 1898 Vassar received the first charter given to a woman's college. Four chapters have instituted sections in the affiliated colleges for women, viz., Brown, Columbia in Barnard, Western Reserve, and Hobart in William Smith.

Active membership varies in its details with different chapters, but, as a rule, it is extended to members of the senior class studying for a baccalaureate degree in arts or science as distinguished from those studying for technical or professional degrees; usually also not more than the quarter of a class standing highest is elected, and in many colleges eligibility is further restricted to those who reach a certain percentage. Sometimes elections are made in the junior year as a mark of special distinction. Alumni members are chosen from distinguished alumni, and honorary members are selected from those who have achieved eminence in some branch of learning. Associations have been organized

in New York, Indianapolis, Cleveland, Washington, and Albany, and in Tokyo, Japan, in which membership is confined to graduate and honorary members of the Phi Beta Kappa Society. In 1914 there were 27,645 members, of whom 6613 were women.

The badge consists of a watch key with the Greek letters "ΦΒΚ" standing for the motto "Φιλοσοφία Βίου Κυβερνήτης" (Philosophy the guide of life), and a hand pointing to a group of stars in the upper left-hand corner indicative of the noble aspirations of the fraternity. On the reverse are the letters "S.P.," the initials of the words "Societas Philosophiae," and the date, Dec. 5, 1776, when the society was organized, as well as the name of the owner, with his college and the date of his graduation. See Plate with article SOCIETIES, and article FRATERNITIES.

In 1882, at the suggestion of the Harvard Chapter, delegates met in Saratoga Springs, N. Y., and issued a call for a national organization, which was convened on Sept. 5, 1883. At this time delegates from 16 chapters ratified the constitution and organized a National Council of the United Chapters of Phi Beta Kappa, consisting of 20 senators and delegates not exceeding three from the several chapters of the society. The influence of this council is directed chiefly toward the establishment of uniform customs in regard to membership, details of election, etc. It meets triennially. Under its supervision a general catalogue containing in some form the names and addresses of the 17,000 members of the fraternity was issued in 1900; but since 1910 this and other pertinent information has been given in the *Phi Beta Kappa Key*, which is issued quarterly. There is an extensive literature, consisting of addresses, poems, etc., single and collected, that have been delivered before the various chapters, a bibliography of which is being published in the *Key*. Consult P. S. Northrup and others (eds.), *Representative Phi Beta Kappa Orations* (Boston, 1915).

PHIDARI. A river in Ætolia, Greece (Map: Greece, C65). The Phidari rises in the Vardusia Mountain and after a southwesterly course of about 65 miles flows into the Gulf of Patras.

PHIDIAS, or **PHIDIAS** (Lat., from Gk. *Φειδίας*). The greatest sculptor of ancient Greece, born in Attica, probably between 500 and 490 B.C., the son of Charmides. His master seems to have been the Athenian Hegias, famous for his statues of divinities, and some late authorities connect him with the Argive Hage-laidas also; but both these statements have been questioned, and in general the information as to his life is scanty and is often contradictory. Interest in the lives of the great artists arose comparatively late, when accurate information was scarcely attainable. For our knowledge of his works we are dependent on the statements of ancient writers, as no certain original from his hand has survived. The descriptions, however, warrant the assignment to him of the originals from which several marbles were copied, and to his designs we probably owe the sculptures of the Parthenon (q.v.), though none of them can with certainty be attributed to his hand. The unanimous testimony of the ancients and the evidence of the monuments mark him as the typical artist of the best culture of Greece. His genius found the soil for its ripest

expression in the Athens of Pericles (q.v.), and his works stand with the tragedies of Sophocles as the most perfect expression of the spirit of the noblest period of Greek civilization. Noble ideals and a thorough mastery of technic enabled him beyond any other ancient artist to present beauty in its purity and completeness. In his works we find incorporated the desire of Greek art to reproduce the ideal beauty that lies behind the realities of nature, which, while holding fast to truthful expression, seeks to show forth the typical and permanent elements rather than the individual and transitory. This endeavor to express the sublime ideals formed within the soul was recognized by the ancients as the source whence came the inspiration for the colossal statue "Zeus" at Olympia, which the artist was said to have drawn from Homer (*Iliad*, i, 529), and which seemed to incorporate the divine majesty, power, and loving-kindness. In all branches of sculpture we find Phidias celebrated. In bronze were wrought by him the "Athena" of the Lemnians, probably represented in a statue at Dresden and a head at Bologna, and the colossal "Athena" sometimes called the "Promachos," which ancient tradition at any rate attributed to him; in marble, an "Aphrodite" in Athens, and the face, hands, and feet of an "Athena" at Plataea, whose drapery was of gilded wood, thus forming a cheap substitute for the chryselephantine technic in which he attained his greatest fame. His earliest work in this style was an "Athena" at Pellene in Achæa, but his most celebrated were the "Zeus" at Olympia (q.v.) and the "Athena" of the Parthenon. In this style a core of wood was overlaid with ivory to represent the flesh, and gold, often inlaid with enamel, for drapery. On the statue "Athena" in the Parthenon the gold was detachable and was valued at 44 talents. The "Zeus" at Olympia represented the god seated on his throne, wearing on his head a wreath of olive, and holding in his left hand the sceptre crowned with an eagle; on his extended right hand stood a "Nike" (Victory) holding a fillet. The throne was elaborately decorated with figures in relief and in the round. Our only knowledge of this statue is from descriptions and representations on late coins of Elis, which are, of course, far too small to give any satisfactory idea of its appearance. It may be added that the so-called "Zeus Otricoli" of the Vatican is certainly not Phidian. The "Athena Parthenos" was a standing figure. In her left hand the goddess held her lance, and at her left side stood the shield. The extended right hand also held a "Nike" and was perhaps supported by a pillar. Here, too, the shield, the pedestal, the helmet, and even the soles of the sandals were decorated with scenes from Grecian legend. This statue was erected in 438 B.C., and if Phidias supervised the decorations of the Parthenon he must have worked in Athens from about 447 to 433 B.C., for the building was not completed before this date. The chronology and events of the closing years of his life are much disputed, and the ancient testimony is conflicting. All accounts agree that he was tried at Athens for embezzling the gold appropriated for the statue; but, while one account says he died in prison, another says he was banished, went to Elis, made the statue "Zeus" at Olympia, and was then accused and put to death by the Eleans. This last can scarcely be right, as we know his descendants

enjoyed hereditary honors at Olympia. The most probable theory is perhaps that the statue "Zeus" was made just after the middle of the fifth century B.C. and that after this achievement the artist remained in Athens. It may be regarded as certain that he shared in the attack on the friends of Pericles, and the account may be true that, while acquitted of the charge of embezzlement, he was condemned for impiety in introducing his portrait on the shield of the "Athena Parthenos." Many competent archaeologists, however, prefer to date the "Zeus" later than the "Parthenos."

Bibliography. In addition to the histories of Greek sculpture cited under GREEK ART, consult: C. O. Müller, *De Phidias Vita et Operibus* (Göttingen, 1827); Eugen Petersen, *Die Kunst des Phidias* (Berlin, 1873); Charles Waldstein, *Essays on the Art of Phidias* (New York, 1885); Maxime Collignon, *Phidias* (Paris, 1886); Adolf Furtwängler, *Masterpieces of Greek Sculpture*, translated by E. Sellers (New York, 1895), of great value for the attribution of extant marbles to Phidian originals, but to be used with caution; *Phidias* in "Masters in Art Series" (Boston, 1902), with good bibliography; E. A. Gardner, *Six Greek Sculptors* (London, 1910); id., *A Manual of Greek Sculpture* (ib., 1911); H. H. Powers, *The Message of Greek Art* (New York, 1913); Percy Gardner, *The Principles of Greek Art* (ib., 1914); and the works on Athens, by D'Ooge, Gardner, and Weller, cited under PARTHENON. For the death of Phidias, consult in addition: Loescheke, "Phidias' Tod," in *Historische Untersuchungen* (Bonn, 1882); Schöll, "Der Prozess des Phidias," in *Sitzungsberichte der Münchener Akademie* (Munich, 1888).

PHIDON. Son of Aristodamidas and King of Argos, eighth century B.C. He restored several towns to the Kingdom, but did not succeed in his ambition to extend his authority throughout the Peloponnesus. He is best remembered for the introduction of copper and silver coinage and of a new scale of weights and measures. This system, which finally was used throughout the larger part of Greece, was known as the Æginetan, from Ægina, whose inhabitants through their commerce did most to extend its use.

PHIGALIA. A town of ancient Arcadia, now in the Olympia district of the Province of Messenia, 25 miles northwest of Messene. Near by are the falls of Neda. In 659 B.C. Phigalia was taken by the Spartans, but later became free. Its celebrity in modern times rests on the fact that the ruins of a magnificent temple of Apollo stand on Mount Cotylum at Bassæ in the Commune of Phigalia, about five miles from the town proper. Consult K. Baedeker, *Greece*, 392-396 (4th Eng. ed., Leipzig, 1909), and J. P. Mahaffy, *Rambles and Studies in Greece* (7th ed., New York, 1913). See PHIGALIAN MARBLES; ICTINUS.

PHIGALIAN MARBLES. The sculptured frieze taken from the interior of the cella of the temple of Apollo at Bassæ, 5 miles from Phigalia (q.v.), in Arcadia, in 1814, and transferred to the British Museum. It represented the contest between the Centaurs and the Lapithæ and the Greeks and the Amazons. The temple is situated in the extreme southwest of Arcadia, about four miles from Phigalia, on a terrace on the side of a mountain in a picturesque and wild country, and had been completely forgotten

till it was discovered accidentally in 1765 by a French architect, Bochor, and soon after was visited and described by the English traveler Chandler, who was followed by Gell, Dodwell, and others. In 1811 and 1812 it was carefully examined by a body of English and German artists and scholars, the results of whose investigations are given in Stackelberg, *Der Apollo Tempel zu Bassa in Arkadien* (Rome, 1826), and Cockerell, *The Temples of Jupiter Panhellenius at Aigina and Apollo Epicurus at Bassa, near Phigaleia, in Arcadia* (London, 1860). The temple of Apollo is of a hard yellowish-brown limestone and is a Doric hexastyle peripteros, with 15 columns on the sides, about 125 feet long and 46 feet wide. Owing to the nature of the ground, its main axis runs north and south, but there is a small side door in the east wall of the cella, opposite the cult statue. Of the 38 columns, 35 are still standing and support much of the architrave, though the pediments and the ceiling have fallen. The fallen members lie about the ruin, which appears to have been largely caused by Christian iconoclasm and greed for the metal clamps by which the stones were held. From 1903 on M. Kavvadias, acting for the Greek Archaeological Society, used the existing remains in a restoration of the building. The sculptures show great skill and boldness in design, but the execution is by no means so praiseworthy, as the proportions are often bad and the faces dull. As the temple was the work of Ictinus, the architect of the Parthenon, it is very probable that the sculptures were designed by an Athenian artist, but the carving is probably the work of less experienced Arcadian sculptors. The fragmentary sculptures on the metopes of the pronaos and opisthodomos are of rather better workmanship. In addition to the general works cited under GREEK ART, by Collignon, Overbeck, Mitchell, and Murray, consult: "Phigaleia" in K. A. Baumeister, *Denkmaler des klassischen Altertums*, vol. iii (Munich, 1888); A. H. Smith, *Catalogue of the Sculptures in the British Museum* (3 vols., London, 1892-1904); K. Baedeker, *Greece*, 392-394, with plan (4th Eng. ed., Leipzig, 1909); J. P. Mahaffy, *Rambles and Studies in Greece* (7th ed., New York, 1913). See ICTINUS.

PHI KAPPA PHI. An honor society organized in 1897 and composed of graduate and undergraduate members of all departments of American universities and colleges. Its objects are to emphasize scholarship in the thought of college students, to hold fast to the original purpose for which institutions of learning were founded, and to stimulate mental achievement by the prize of membership; also to bind more closely the alumni to their Alma Mater, to furnish an additional tie of college friendship, and to interest its members in the promotion of a more thorough education. In order to gain these objects membership is restricted to a number of students in any school or department, not exceeding one-third of the whole graduating class, who have distinguished themselves by scholarship or intellectual service to their college or university. These members are elected one year before graduation. Persons may be elected to honorary membership who have won distinction in science, literature, or education. The badge is a globe bearing the letters of the fraternity "ΦΚΦ" and surrounded by the rays of the sun arranged in eight groups,

and it may be worn as a pendant, pin, button, or medal. There are chapters in the University of Maine, University of Tennessee, Pennsylvania State College, Massachusetts Agricultural College, Delaware State College, University of Nevada, Iowa State College, University of Florida, Rhode Island Agricultural College, North Dakota Agricultural College, and Nebraska Wesleyan University. The fraternity is divided into four provinces—north, east, south, and west—each of which has a special secretary.

PHILA. Daughter of Antipater, Regent of Macedonia. She was celebrated as one of the noblest women of her time. In 322 B.C. she was married to Craterus. He died in about a year, and Phila was then married to Demetrius, son of Antigonus, and shared his varying fortunes. When Demetrius was banished from Macedonia in 287 B.C., Phila killed herself at Cassandrea. She left two children by Demetrius, Antigonus and Stratonice. The son, surnamed Gonatas, became King of Macedonia; Stratonice became the wife of Seleucus and subsequently of his son Antiochus. Consult W. W. Tarn, *Antigonus Gonatas* (Oxford, 1913).

PHILADELPHIA (Lat., from Gk. *Φιλαδέλφεια*, *Philadelphēia*, lit, brotherly love, but as a city name common in the Macedonian period it was given in honor of certain individual rulers bearing the name Philadelphia). 1. A city of Asia Minor, named in honor of Attalus II Philadelphus of Pergamum, now called Alashehr (the "reddish city," from the color of the hillsides in the rear), situated in the valley which runs inward from the Gulf of Smyrna, about 75 miles east by south of Smyrna (Map: Turkey in Asia, C 3). The city was founded in the second century B.C. It lay on the trade routes from the interior to the coast and assumed a position of commercial importance. Its name was changed at different times, as shown by the coins of Roman emperors, and it was a point of considerable importance in the political affairs of the Province of Asia. Philadelphia was the head of a district in which Christian churches were established very early, since messages were sent to it in the Book of Revelation (iii. 7-13). Little is known concerning the number or size of these churches. Philadelphia bore a conspicuous part in later history, figuring as a bulwark against the Turks. Consult W. M. Ramsay, *Letters to the Seven Churches* (New York, 1904). See ALASHEHR. 2. The later name of the ancient Rabbah, or Rabbath Ammon (q.v.), the capital of the Ammonites, captured by David (2 Sam. xi-xii). Its name was changed to Philadelphia by Ptolemy II Philadelphus, at which time it was transformed into a Greek city. It ultimately became one of the Decapolis (q.v.) and in the Roman period was a large and important city, as is evidenced by the extensive ruins on its site.

PHILADELPHIA. The chief city of Pennsylvania and the third city in population in the United States, coextensive with Philadelphia County, having an area of 129.5 square miles. It is situated in the southeast corner of the State, at the confluence of the Schuylkill and the Delaware rivers, about 50 miles from the mouth of the Delaware and 100 miles from the Atlantic Ocean, in lat. 39° 57' N. and long 75° 9' W. It is distant from New York by rail 90 miles, from Washington 136, and from Chicago 822.

The climate of Philadelphia is considerably milder in winter and warmer in summer than that of the central and western cities of the State. The mean temperature for January, is 32.6° F. and for July 76° F. The heat during July and August is often very intense, the temperature rising sometimes above 100° F. The average annual rainfall in the city is 41.8 inches, slightly heavier than that of New York.

Description. William Penn founded the city on the narrow neck of land, about 2 miles wide, lying between the Delaware and the Schuylkill rivers. Disregarding his plan for a simultaneous growth of the city backward from each river, the early settlers preferred to remain near the Delaware, along which occurred the first northern and southern expansion of the city. It was not until the beginning of the nineteenth century that growth to the west reached Broad Street, the half-way line to the Schuylkill. From this time the city has grown more rapidly, extending southward to the junction of the two rivers, westward far beyond the Schuylkill to Cobb's Creek, and northward in two main branches, the easternmost following the Delaware to a point beyond Poquessing Creek, 18 miles from the southern limit, and the westerly through the suburban region extending 10 miles along the Wissahickon, a tributary of the Schuylkill. In the western and northern regions of the city areas of open country still exist. From the dike-protected lowlands of the south, 5 feet below the average high tide, the city rises gradually to a height of 443 feet in the hilly regions of the northwest. The general plan of the streets is determined by the east and west direction of Market Street, the main business thoroughfare, 100 feet wide, which runs directly west from the Delaware, a distance of 6 miles, separating the city in respect of street numbering into north and south divisions, and by Broad Street, 113 feet wide and 12 miles long, which at City Hall Square intersects Market at right angles. The main portion of the city is laid out with great regularity, the numbered streets running parallel with Broad and the named streets with Market. The regularity of the general plan is broken, however, in the portion east of the Schuylkill, by Ridge and Germantown avenues, which intersect diagonally the streets north of Market, and by Passyunk and Moyamensing avenues, south of Market Street; in West Philadelphia, Lancaster Avenue, north, and Woodland Avenue, south of Market Street, act in a similar manner, though in this and in other outlying sections there is, in general, less attempt to follow strictly the regularity of the older portions of the city. There are approximately 1615 miles of streets, of which 527 miles are paved with asphalt and 10 miles with wood blocks. The mileage of sewers is 1300 and of water mains 1800. The street railways (employing the overhead trolley system, and in 1914 carrying 588,854,662 passengers) have a total mileage of 664, and the steam railroads of 750. The Market Street Subway extends from the Delaware River to the Schuylkill, and its elevated extension follows Market Street to Sixty-ninth. The new comprehensive plans for rapid transit include a Broad Street Subway extending from Market Street south to League Island and north to City Line. An elevated line running north on Second Street to Frankford also is projected. Eighteen railroad and city bridges

cross the Schuylkill, and one railroad bridge crosses the Delaware; some of these are among the finest structures of their kind.

It is possible to characterize with tolerable accuracy the various sections of Philadelphia. The business life gathers around Market Street. The region north and south of this thoroughfare bordering the Delaware is devoted to wholesale trade, shipping, and warehouses; from Third Street to Fifteenth, Arch, Market, Chestnut, and Walnut Streets may be designated as the banking, financial, and shopping centres. Just southeast of City Hall Square stands the Wanamaker store. At the northwest corner of Broad and Market streets is found the Broad Street Station of the Pennsylvania Railroad, and at Twelfth and Market streets stands the Terminal Building of the Philadelphia and Reading Railroad. The Baltimore and Ohio Railroad Station is situated at Twenty-fourth and Chestnut streets. Less important business centres lie in West Philadelphia along Lancaster Avenue and Fifty-second Street; in North Philadelphia along Girard, Columbia, and Lehigh avenues; in Germantown along Germantown Avenue, and in Frankford along Frankford Avenue. Large manufacturing establishments are scattered throughout the city. The Kensington district is justly known as the centre of the textile industry. At Port Richmond is located Cramp's Shipyard. The model plant of the Stetson Hat Factory is found at Montgomery Avenue and Fourth Street. The central plant of the Baldwin Locomotive Works covers several acres west of Broad Street along Spring Garden. The Disston Saw Works cover a large area on the Delaware River at Tacony. Along the Schuylkill at Manayunk are situated the great carpet mills, and farther south, at the junction of the Schuylkill and the Delaware rivers, are large oil refineries and coal wharves.

The more aristocratic residential section clusters about Rittenhouse Square. The foreign quarter, with an unmistakable Italian aspect, lies in the southeastern part of the city. The negro quarter lies slightly to the west of this. The slums may be found in limited areas in different parts of the city, although the worst districts are to be found in the older portion of the city lying between Vine and South streets, east of Broad. One of the noticeable features of Philadelphia is its charming suburban territory, unsurpassed by that of any city in the world, extending in some places beyond the city limits. To the north lie the old established communities of Germantown, Chestnut Hill, Whitemarsh, Ambler, Fort Washington, and Jenkintown contiguous to the Reading Railway, and Old York Road. Along the main line of the Pennsylvania Railroad lie the wealthy suburbs of Overbrook, Merion, Ardmore, Haverford, Bryn Mawr, Villa Nova, Wayne, and Paoli.

By its name Philadelphia suggests its distinctive title, the City of Brotherly Love; its early history renders especially appropriate that of the Quaker City, but none more truly characterizes it than that of the City of Homes. Of 400,000 buildings of all kinds (1914), 360,000 are dwelling houses, with an average of 5.2 persons per dwelling and with 35 per cent owned by the occupants. There are 987 church buildings, 450 schools, public and private, and 483 buildings used for charitable and benevolent purposes. In the older quarters there are many

survivals of the long blocks of red-brick houses, with white marble steps and trimmings, that early gave Philadelphia the neat appearance for which it is still famous. In the newer parts red brick is still the principal building material, and the residences are commonly built in long blocks of houses of four or more similarly arranged rooms, each separated from its neighbors by a brick party wall and varying in size with the width of the street. On some of the larger streets the houses are built in pairs, instead of in blocks, but the interior plan of the separate houses is the same. There is, however, a more welcome variety in styles of architecture than formerly, and various kinds of building stone, along many streets, are beginning to break the monotony of the customary brick, while in the better suburbs the residences are almost wholly of stone or wood. In general, Philadelphia, in its homes and parks, may be said to retain to a greater degree than any other large American city the finer qualities of its early town life and to combine with these the best features of modern industrial development.

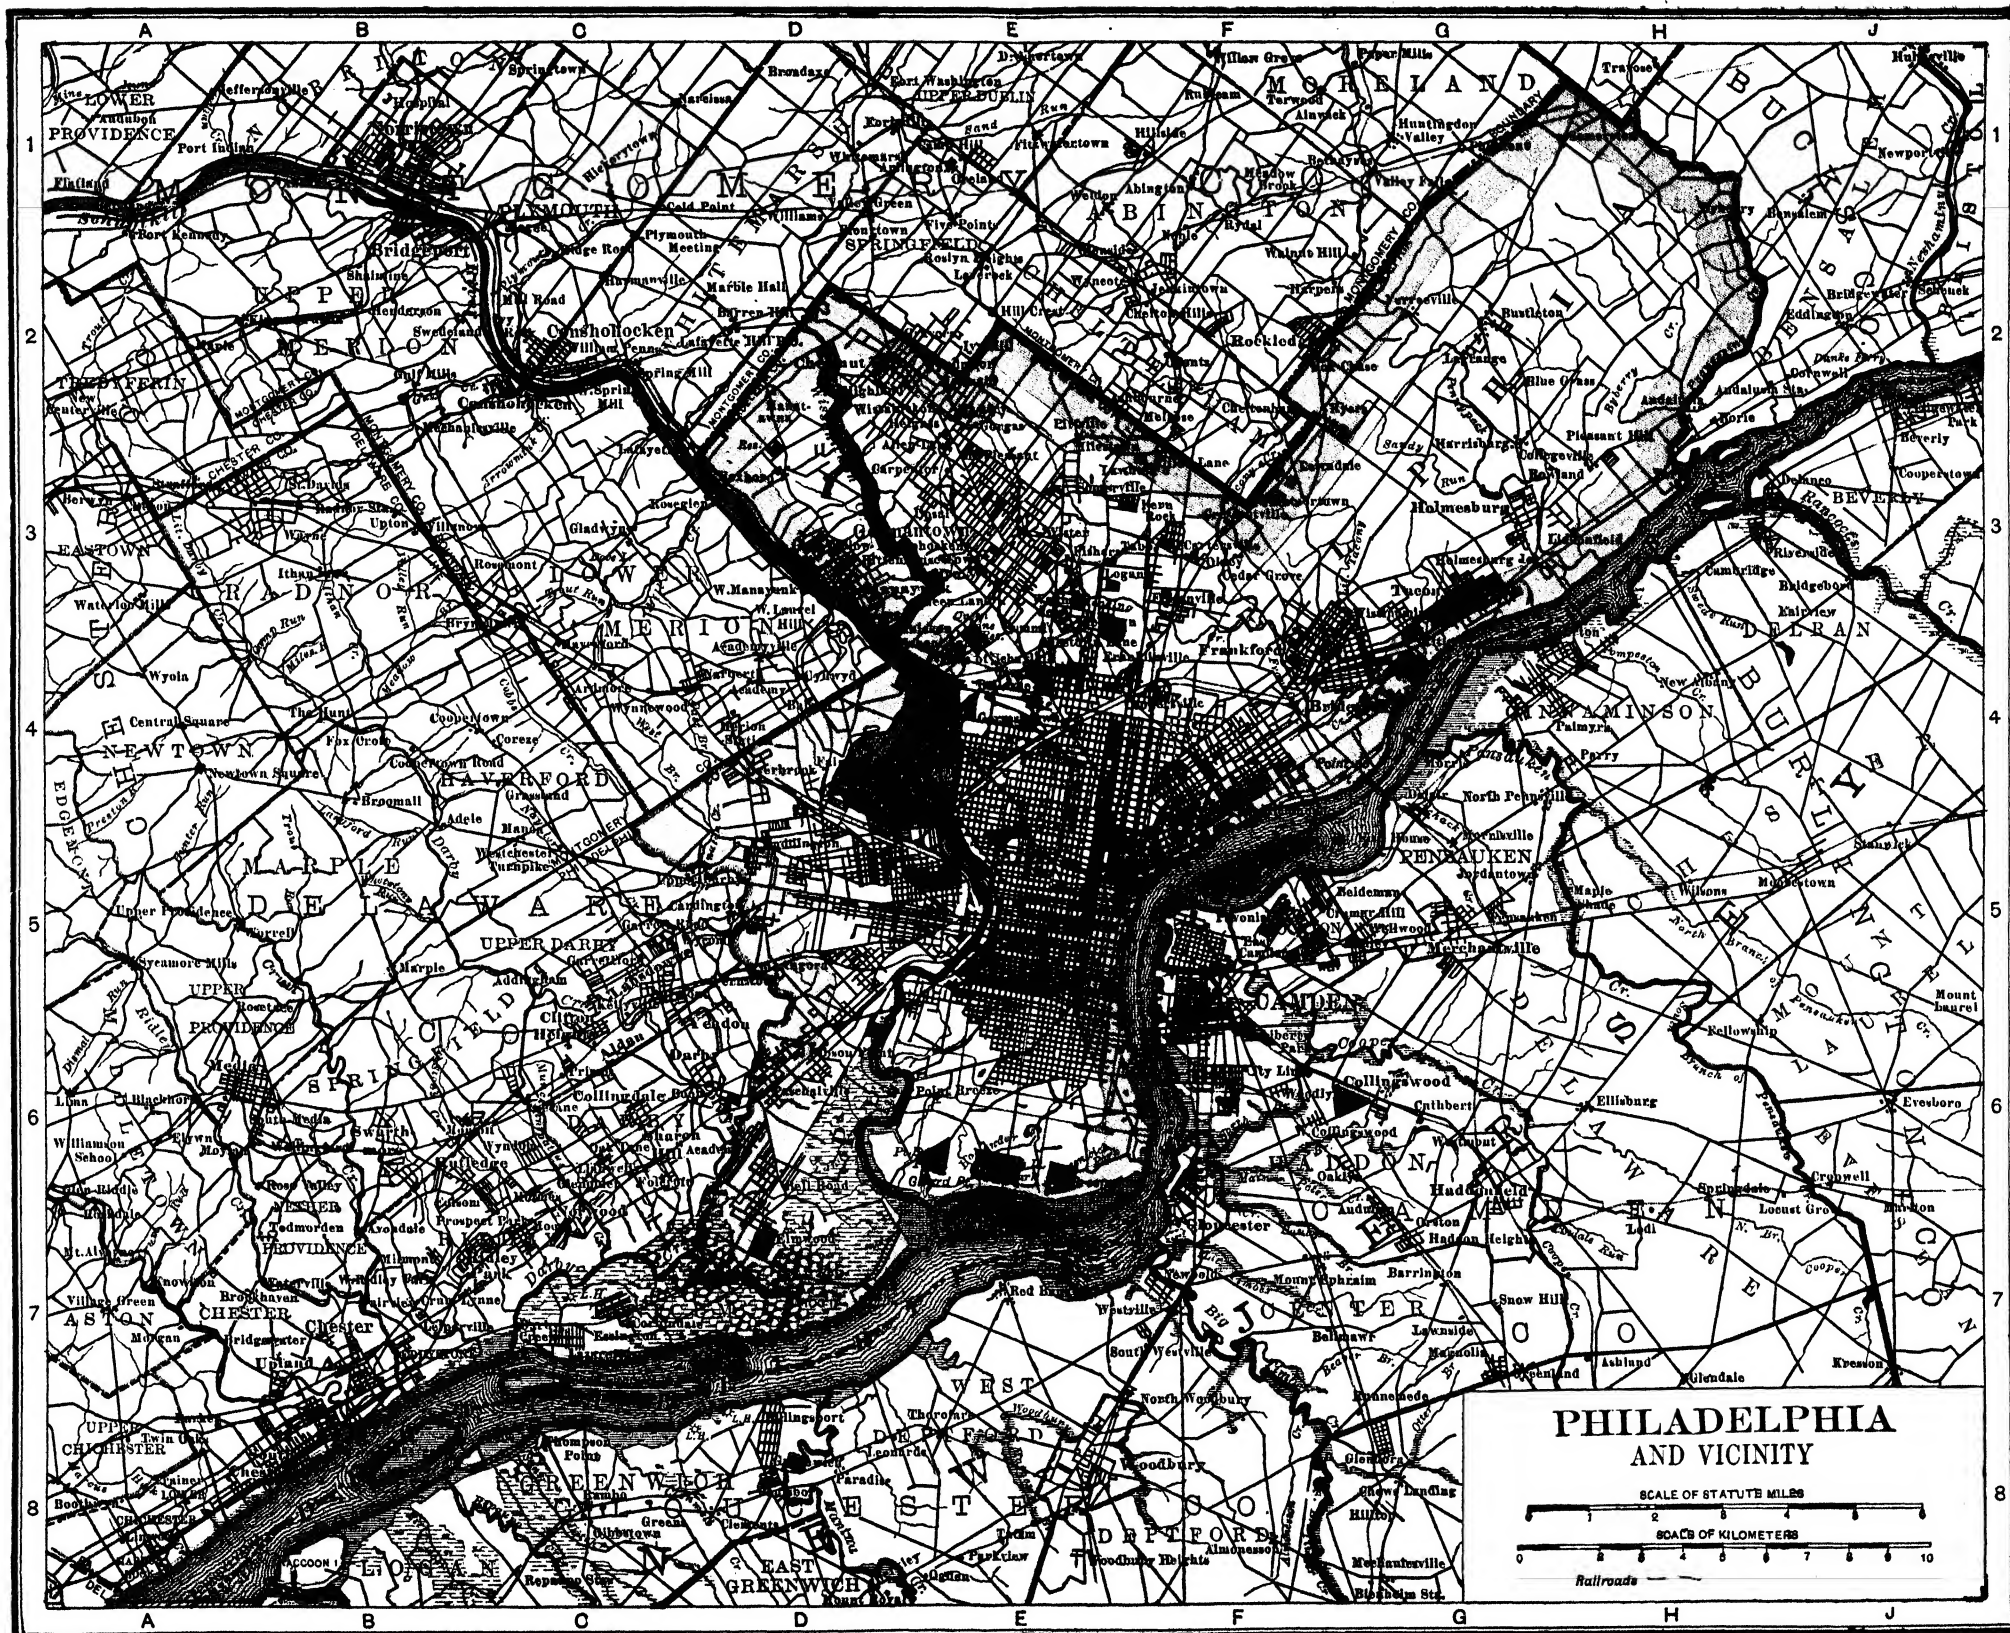

Buildings. Adherence to an early architectural idea has made Philadelphia one of the last of large American cities to favor tall buildings. Recently, however, a group of tall structures has sprung up in the vicinity of the Public Buildings, as Philadelphians designate their City Hall. This immense structure, begun in the early seventies and covering $4\frac{1}{2}$ acres, accommodates nearly all the municipal and county offices and the State and county courts. It is a marble edifice, of modern French Renaissance style, 90 feet high, rising in corner pavilions to 161 feet, in central pavilions to 203 feet, and in the tower surmounted by a colossal statue of William Penn (37 feet high and weighing 53,348 pounds) to a height of 547 feet, $11\frac{1}{4}$ inches. The building, inclosing a large central court, measures 486 feet, 6 inches by 470 feet, and in it are 662 rooms, with a floor space of $14\frac{1}{2}$ acres. In the tower are four great clock dials, each with a minute hand 11 feet long and weighing 225 pounds and regulated by a vibration and temperature-proof clock 143 feet below. The Public Buildings thus far have cost more than \$24,000,000. The assessed valuation of all the municipal buildings in 1914 was \$319,000,000.

Among the important Federal buildings are the United States Mint, on Spring Garden Street, one of the largest in the world, the Post Office Building, bounded by Market, Chestnut, Tenth, and Ninth streets, occupying the site of the first President's mansion and the subsequent home of the University of Pennsylvania; the Custom House, on Chestnut Street near the Delaware River, modeled after the Parthenon and erected in 1819-24 for the Second United States Bank; the Arsenal, below South Street near the Schuylkill; and at the southern end of Broad Street the large League Island Navy Yard. On Chestnut Street, between Fifth and Sixth, stands Independence Hall, America's most famous landmark. It was built in 1735 and used as the State House until 1799. After many architectural changes it has been finally restored to its original form, following the plans made by its designer, Andrew Hamilton. Here met the Second Continental Congress, May 10, 1775. Here, on June 15, 1775, Washington was made Commander in Chief of the American Army. On June 7, 1776, Richard

Henry Lee introduced the motion which on July 2, 1776, culminated in the freeing of the Colonies from British rule. On July 4, 1776, was adopted the Declaration of Independence of Thomas Jefferson and his committee. From the tower of this building pealed forth the notes which "proclaimed liberty throughout all the land unto all the inhabitants thereof." The sacred Liberty Bell now reposes on the main floor, directly beneath the historic tower under which it formerly hung.

Old Congress Hall, restored in 1913, stands at the northwest corner of Sixth and Chestnut streets. Here Congress sat from 1790 to 1800. In this building Washington was inaugurated in 1793 and John Adams in 1797. The old City Hall, where the United States Supreme Court sat from 1791 to 1800 is located at the northeast corner of the square. Carpenter's Hall on Chestnut Street is inseparably associated with the first Continental Congress, the Betsy Ross House is on Arch Street, where the first American flag is said to have been made, the Old Swedes (1700) and Old Christ (1727) churches are of Revolutionary fame; and the first United States Mint is on Seventh Street above Market. The Pennsylvania Historical Society, one of the strongest organizations of its kind in the country, has a finely equipped, fireproof building at Thirteenth and Locust streets.

Philadelphia's recent business structures will compare favorably in size and importance with those of any other American city. Among the leading office buildings may be mentioned the Land Title and Trust Building Annex (319 feet high), the pioneer Betz Building, the Real Estate Trust Building, the Arcade Building, the Commonwealth Trust Building, the Widener Building, and the magnificent Girard Trust Building (a copy of the Pantheon), all grouped around the City Hall. The Drexel Building, the Bullitt Building, and the Provident Building are notable structures of the financial area. In this vicinity, also, is the Philadelphia Contributionship "Hand in Hand," the oldest fire insurance company in America, of whose directorship Franklin was an early member. The Pennsylvania Railroad Station, with a train shed over 590 feet long, and the Reading Terminal, a handsome railway station, approached like that of the Pennsylvania Railroad by a viaduct, are notable railway terminals and office headquarters. Of newspaper buildings the most prominent are those of the *North American* (22 stories), the *Evening Bulletin*, the *Record*, and the *Public Ledger*. The *Ladies' Home Journal*, the *Saturday Evening Post*, and the *Country Gentleman* are housed in the magnificent Curtis Building, facing Independence Square. The building of the old Lippincott Publishing House is on Washington Square. Of semipublic organizations there are the Stock Exchange; the Bourse Building, the home of the Board of Trade, the Trades League, and other trade organizations; and the Commercial Museum, supported by municipal, State, and Federal appropriations and devoted to the encouragement of foreign commerce, especially with Spanish America, is located in the former Export Exposition Building in West Philadelphia, on the site of the Exposition of 1899. Philadelphia has many important hotels; among the most elegant and commodious of these structures may be mentioned the Bellevue-Stratford, the Ritz-Carlton,

with three distinct courses—academic, manual training, and commercial. The basis of the courses is uniform throughout the city except where modified to meet the demands of the community. The Central High School for Boys, founded in 1837, is vested with the power of conferring degrees. The Normal School prepares women, and the School of Pedagogy prepares men, for the profession of teaching. The problem of vocational education centres in the work of the Philadelphia Trades School for Boys. Manual training forms a part of the course for boys and sewing and cooking for girls in the seventh and eighth grades of the elementary course. Backward children and truants are cared for in special schools. In 1915 there were enrolled in the higher schools 15,640 pupils, and in the elementary schools 173,450 pupils. The teaching staff was made up of 5339 officers and teachers, 653 of whom were in the higher schools. The system is designed to give a complete course of instruction, from the kindergarten to the university. The city maintains a complete system of elementary and higher evening schools for men and women, including evening trade schools. The work of the day and evening schools is supplemented by the work done in the summer season in the 22 playground centres under direction of the board of recreation. Through private bequest and municipal legislation there are available 325 free scholarships in the University of Pennsylvania, Bryn Mawr, Lehigh University, and various medical, art, and scientific colleges. The Roman Catholic church maintains an independent system of elementary and higher schools.

At the head of the higher educational institutions is the University of Pennsylvania (q.v.). Philadelphia is a centre of medical education, its prominent medical colleges being those of the University of Pennsylvania, Jefferson, Hahnemann, Medico-Chirurgical, Polyclinic, and Woman's (founded in 1850), the first chartered medical college for women in the world to confer the degree of M.D. The Philadelphia dental college, the dental department of the University of Pennsylvania, the dental school of the Medico-Chirurgical College, and the Philadelphia College of Pharmacy are largely attended. The schools of the Pennsylvania Academy of the Fine Arts (founded in 1805) are the oldest in the country. The Pennsylvania Museum and School of Industrial Art and the School of Design for Women are well known. Bryn Mawr College (q.v.), near Philadelphia, is one of the foremost women's institutions of the United States. The Drexel Institute, founded and endowed with \$2,000,000 by A. J. Drexel, offers at a small cost courses in art, sciences, and industrial training. Other leading institutions are the Franklin and Spring Garden institutes, Pennsylvania institutes for the blind and for the deaf and dumb, Temple University, Episcopal Academy, the seminaries of the Protestant Episcopal, Lutheran, and Roman Catholic churches, La Salle and St. Joseph's colleges, numerous schools of the Society of Friends, including the William Penn Charter (1701, the first chartered school in the country), and the Germantown Academy (1760). The Williamson Free School of Mechanical Trades, located at Williamson, in Delaware County, established under a bequest of \$2,500,000 by the late I. V. Williamson, offers complete trade

courses and supports students free of cost. At the head of the list of institutions for the promotion and diffusion of science and learning stands the American Philosophical Society, with its reference library, containing more than 50,000 volumes and some rare manuscripts, founded in 1743 as the outgrowth of the "Junto." It was early made famous by Franklin, Rittenhouse, the great astronomer, and Godfrey, the inventor of the mariner's quadrant. Among its members are found many of America's noted scholars and men of affairs. The home of the society is on South Fifth Street near Independence Square. Other important institutions are the Philadelphia Academy of Natural Sciences (q.v.), the American Academy of Political and Social Science, the Historical Society of Pennsylvania, the Zoölogical Society, the Numismatic and Antiquarian Society, and the Wagner Institute.

The Free Library of Philadelphia was chartered in 1891, on bequests by George S. Pepper and others, and is maintained by appropriations made by city councils. Its buildings include a main library, occupying temporary quarters at Thirteenth and Locust streets, and 25 branches scattered throughout the city. Of these 17 have been erected out of a gift by Andrew Carnegie of \$1,500,000 for 30 branch buildings. A site of two acres in extent on the Parkway, at Nineteenth and Vine streets, has been acquired by the city, on which it is proposed to erect a main library building. The collection consists (1915) of 510,728 volumes and 214,188 pamphlets, and the total circulation for 1914 was 2,542,137 volumes. The Library Company's collection, begun in 1731 by Benjamin Franklin and his associates of the "Junto," formed the first subscription library in America. Its 200,000 volumes include many of extreme rarity. The Ridgway Branch, an excellent example of pure Greek architecture, contains one of the most valuable reference lists in the United States. It includes also the Loganian Branch, founded by James Logan in 1699. Other important libraries of the 100 in the city are the Mercantile (1821), general circulation and reference; Carpenters' Company (1736), architecture and building; Friends' (1742); American Philosophical Society (1743); Hurst, law; College of Physicians; University of Pennsylvania, Apprentices', Pennsylvania, Presbyterian, and Baptist Historical societies; Drexel Institute; and the H. Josephine Widener Branch of the Free Library, with a valuable collection of reference works.

Hospitals and other Institutions. The municipal charities are the hospitals for the indigent and for the insane, General Hospital, and the Municipal Hospital (contagious diseases). The Pennsylvania Hospital, located at Eighth and Spruce streets, was founded in 1751, through the efforts of Franklin, and maintained entirely by private subscription, and is the oldest institution of the kind in America. The religious denominations maintain institutions, among them being St. Agnes', St. Mary's, and St. Joseph's hospitals (Roman Catholic); Episcopal, Methodist, Presbyterian, Jewish, St. Luke's and Samaritan (Baptist), and German (Lutheran) hospitals. Large hospitals are connected with the university and Jefferson, Medico-Chirurgical, Polyclinic, Hahnemann, and Woman's Medical colleges. Other important charities are the Rush and Phipps hospitals for consumptives,

the Gynæcean, Orthopædic, Wills's, Eye, and Maternity hospitals. There are more than 100 dispensaries, homes, asylums, orphanages, etc. The College Settlement, Society for Organizing Charity, Working Women's Guilds, Flower, Fruit, and Ice Mission, various children's aid, protection, and country-week associations do good work. The city maintains 22 public bath-houses, which are patronized annually by over 5,000,000 persons.

Girard College, founded by Stephen Girard, who at his death in 1830 gave \$2,000,000 for construction and the greater portion of his \$5,000,000 estate for endowment, supports and educates annually over 1556 orphans at a cost of \$706,000 (\$454 each). The residuary fund now amounts to \$31,355,379, which is administered by the board of city trusts. The citizens' permanent relief committee, of which the mayor is president, has relieved thousands of distressed persons in all parts of the world, more than \$6,000,000 having been distributed since 1879. The penal institutions are the Eastern State Penitentiary, the House of Refuge at Glen Mills (boys and girls), the House of Correction (adults), and Moyamensing and Holmesburg County prisons.

Theatres and Clubs. The drama in America began in Philadelphia, a company being organized here in 1749. The first permanent playhouse in the city was built in 1766; a portion of its walls still stands. The Walnut Street Theatre is the oldest in the country. At Locust and Eighth streets stands the Musical Fund Hall, where Malibran, Jenny Lind, and Ole Bull appeared. Other important playhouses are Keith's Theatre, the Garrick, the South Broad, the Chestnut Street, the Little Theatre, the Forrest, the Adelphi, the Lyric; the Metropolitan, the Grand, and Chestnut Street opera houses. The Academy of Music, with a capacity of 2900, and the Horticultural Hall adjoining it, are used for large public gatherings. The Metropolitan Opera House, which has a seating capacity of 4000, is the home of grand opera in Philadelphia.

Leading clubs are the Union League (with a handsome brownstone building), Philadelphia Manufacturers', Mercantile, Rittenhouse, Markham, University, Columbia, the Art (installed in a beautiful Renaissance structure of Pompeian brick and Indiana limestone), Penn. Lawyers', Clover, Five o'Clock, Maennerchor, Philadelphia Country, Manheim, Pen and Pencil, Philadelphia Yacht, New Century, Acorn (women's), Sketch, Franklin Inn, Poor Richard, Plastic, and Le Coin d'Or. The "State in Schuylkill," founded in 1732, is the oldest club in America. The City Club, an organization for the study of civic problems, has 2000 members.

Commerce and Manufactures. The industrial development of Philadelphia has been greatly aided by the favorable location of the city for commerce and especially by its proximity to raw materials. The city has the advantage of superior railroad facilities. The great Pennsylvania Railroad system, with 11,794 miles of owned and leased lines, and the Philadelphia and Reading Railway, with \$140,000,000 capital and 1457 miles of track, terminate and have some offices near the City Hall. The Pennsylvania lines give Philadelphia more direct communication with the productive Middle West than is enjoyed by any other Atlantic port. The Baltimore and Ohio enters

where Chestnut Street crosses the Schuylkill. The tracks of the Pennsylvania are nearly all elevated or below grade, the Baltimore and Ohio below, and the Reading partly above, partly below, but mainly at grade. The Delaware River admits of the entrance of ocean vessels and is navigable the entire length of the city's frontage (37 miles). Work is now in progress to deepen the river to 35 feet. The Schuylkill River is navigable 8 miles for vessels of light draft and is being dredged to a depth of 22 feet. The general export and import interests, including the Port Richmond coal wharves, are located mainly on the Delaware. Twenty-one transatlantic lines enter the port.

Early in the nineteenth century Philadelphia was first among United States ports in foreign commerce, but its relative importance declined, until in 1913 it ranked fifth. The imports for that year were valued at \$91,934,112 and the exports at \$72,422,585. In 1914, 419 sailing vessels, with an aggregate of 434,799 tons, and 2583 steam vessels, foreign and coastwise, with a tonnage of 7,305,644, entered the port. The pipe lines of the Standard Oil Company from the wells in the northwest section of the State terminate at Point Breeze on the Schuylkill, and oil is one of the largest and most valuable shipments. In 1913 the exports of illuminating mineral oil amounted to 315,577,029 gallons, valued at \$23,317,034. Wheat and flour are also exported extensively, 7,164,386 bushels of wheat, aggregating \$6,836,325 in value, and 1,172,242 barrels of flour, valued at \$6,123,990, being exported in 1913. There were also considerable exports of meat and meat products. Coal and copper are other important exports. The largest import is sugar, amounting in 1913 to a value of \$9,037,896. Among other leading imports are goat skins (\$5,770,201), fabrics, bananas, etc.

Philadelphia is a great manufacturing centre, ranking third in the United States in value of products. In the production of steam locomotives, street-railway cars, iron and steel, knit goods, carpets and rugs, leather, saws, felt hats, upholstery goods, and oilcloth, Philadelphia is unequaled by any other city in America. The city is second in foundry and machine-shop products, sugar refining, petroleum refining, worsted goods, chemicals, druggists' preparations, dyeing and finishing textiles, cordage, twine, and fertilizers. The value of the total output in 1909 was \$1,363,060,000, nearly double the corresponding figure for 1900. The refining of sugar and molasses is the most important industry, according to the value of the products, \$37,600,000. The manufacture of locomotives is a very important industry. The Baldwin Locomotive Works has a yearly capacity of 2500, aggregating in value \$42,000,000. For years Philadelphia has been the foremost shipbuilding centre in the country. Many warships of the United States and also a number for foreign governments have been built at the Cramp shipyard, which occupies about 52 acres in the Port Richmond section. These two establishments are not only the leading ones of Philadelphia, but each excels in its own line for the country at large. In the total manufacture of textiles also the city ranks first (though not for any one branch), the value of the principal textiles produced in 1914 being as follows: woolen and worsted goods, \$54,900,000; cotton goods, \$22,500,000; hosiery and knit goods,

\$23,900,000. The value of the foundry and machine-shop products was \$38,600,000; the output of clothing, \$59,100,000; of carpets and rugs, more than \$22,600,000; of leather, nearly \$24,000,000; and of malt liquors, more than \$14,200,000.

Philadelphia is the seat of the Federal Reserve District No. 3, having 628 member banks. Its territory embraces the eastern two-thirds of Pennsylvania, the southern half of New Jersey, and all of Delaware. The capital subscribed is \$10,527,500, with a paid-in capital of \$5,263,750.

Government. The executive branch of the government is dual, consisting of county and municipal departments. The municipal form of government is provided for by the Bullitt Bill, Act of June 1, 1885, amended April, 1903, June, 1909, and May, 1913, the basic elements of which are concentration of authority in the mayor and the distinction between the executive and legislative functions. The executive departments are: public safety, which includes bureaus of police, fire, electricity, corrections, boiler inspection, building inspection, and elevator inspection; public works, which includes bureaus of water, city property, highways, gas, lighting, and surveys; public health and charities; wharves, docks, and ferries; city transit; law; revision of taxes; receiver of taxes, city controller, and city treasurer (ex-officio county treasurer), and supplies. The mayor, who is elected once in four years and is ineligible for succession, appoints directors of the departments of public works, public safety, public health and charities, and supplies, wharves, docks, and ferries, city transit, subject to confirmation by select council. Directors appoint chiefs of bureaus and other employees under civil-service requirements. The receiver of taxes, city treasurer, city controller, and city solicitor are elected by popular suffrage. The board of public education consists of 15 members, appointed by the judges of the courts of Common Pleas. The board of public education is not a department of the city government. It has entire control of the schools and is empowered by the State School Code to lay and collect a school tax not exceeding six mills. The sinking fund commission consists of the mayor, city controller, and one member elected by councils. The commissioners of Fairmount Park and members of the board of revision of taxes, and the board of city trusts, in charge of Girard College and estate and minor trusts, are also appointed by the courts. The county officials are commissioners in charge of elections, etc., treasurer, recorder of deeds, register of wills, clerk of the Court of Quarter Sessions, coroner, sheriff, and district attorney. The legislative function is exercised by select and common councils, the former consisting of one member from each of 42 wards, the latter of one member for every 4000 voters. Select councilmen serve four years, and common councilmen two, without pay. The veto power is vested in the mayor, a three-fifths vote enacting over it. The judiciary consists of police magistrates (limited civil and preliminary criminal actions); judges of the courts of Common Pleas (civil), who are also judges of the courts of Quarter Sessions (criminal); judges of the Orphans' Court (estates); and judges of the Municipal Court (with juvenile and domestic-relations divisions). The Superior and Supreme courts of Pennsylvania and the United

States District and United States Circuit courts sit in the city.

The lighting of the city is done by 24,319 gas lamps, which are supplied by the lessees of the Philadelphia Gas Works free of cost to the city, 19,097 naphtha incandescent lamps and 14,619 electric arc lights, supplied by private corporations. The water works are under municipal ownership and consist of 9 pumping stations, 52 pumps, and 16 reservoirs. The water is distributed through 1783 miles of pipe, and 17,415 fire hydrants are provided for fire protection. The city has 50 miles of water pipe on high-pressure service. The complete works, with a daily capacity of 382,000,000 gallons, are estimated to cost \$75,000,000. Since the completion of the filtration system Philadelphia has enjoyed a supply of pure water. The standard of purity is kept higher than the standard set by the Bureau of Standards of the United States Government. It is also higher than the standards set by the most advanced European cities. The death rate from typhoid fever has been reduced to eight per hundred thousand.

Finances. The city's receipts for 1914 were \$32,536,665. The important items were: taxes, \$14,932,417, gas, \$1,953,342, personal-property tax, \$2,249,410; permits, fees, etc., \$9,347,115, including water rents, \$4,215,617. The expenditures were \$32,348,054; the largest item was \$17,939,741 for municipal departments and bureaus; police, \$4,065,574, fire, \$1,317,547; water, \$1,331,262; highways, \$3,452,778; electrical bureau, \$1,696,556. Other large disbursements were: interest on funded debt, \$8,774,802; several sinking funds, \$8,978,128; mandamus, \$6,803,347. The general cash balance on Jan. 1, 1914, was \$3,516,343. The gross debt at the same date was \$117,686,850; the city loans held by the sinking fund amounted to \$19,769,500, leaving a net city debt of \$97,917,350, the total assets were \$22,230,052, not including the real estate owned by the city, valued at \$319,148,733. The assessed real-estate valuation, subject to taxation, as estimated in June, 1915, was \$1,669,891,999. The assessed personal-property valuation was \$582,896,468. Under the law the debt is limited to 7 per cent. All permanent loans after the 2 per cent point has been exceeded must be authorized by a vote of the people. Expenses incurred by the board of public education for 1914 were \$8,377,953.

Population. The population in 1910 was 1,549,008, Philadelphia ranking third among American cities. Since 1854 no territory has been added to the municipal limits. The percentage of increase from 1880 to 1890 was 23.58, from 1890 to 1900, 23.57, and from 1900 to 1910, 19.70. Of the white population 61.9 per cent is of foreign parentage, but native whites of foreign parentage comprise 32 per cent of the entire population. The negroes numbered 84,549 in 1910; Chinese, Japanese, and Indians, 1177. The largest classes of European descent are Irish, German, Russian, English, and Italian. French, Greeks, Armenians, Hungarians, Bohemians, and Poles are present in lesser numbers. Though some tendency to congregate is shown, there are few well-defined foreign colonies. In 1800 the population of Philadelphia was 23,522; in 1820, 63,802; in 1840, 93,665; in 1860, 563,529; in 1880, 847,170; in 1900, 1,293,697; in 1910, 1,549,008; in 1914 (census est.) 1,657,810.

History. The first settlement (called Wicaco) within the present limits of Philadelphia was

CITY HALL

INDEPENDENCE HALL

PHILADELPHIA

made in 1636 by a company of Swedes sent out by the government of Queen Christina. On Oct. 7, 1681, Capt. William Markham, Deputy Governor for William Penn, arrived with a small company and organized an English settlement here, which in July of the following year was laid out and called Philadelphia (the city of brotherly love). In 1683 a company of Germans, under the leadership of the scholarly Pastorius, invited hither by Penn, arrived and settled at Germantown, within the present city limits. In 1684, immigration having been rapid from the beginning, there were 300 houses and more than 2500 inhabitants. The greater part of the early settlers were Friends, and their influence, combined with that of the Germans, predominated for many years and greatly affected the course of Pennsylvania's history. In the early part of the eighteenth century the tide of immigration set in from Scotland and Ireland. By the time of the outbreak of the Revolution the Scotch-Irish gained the balance of political power. Throughout the Revolutionary period they shaped the political policies of the Middle Colonies. Penn returned to England in 1684 and did not revisit the city until 1699, when he found a population of 4500 and 700 houses. He chartered the city in 1701, and thereafter frequent controversies arose between the people and the Penn family over proprietary privileges, especially regarding taxation of the Penn lands. The first English school was opened in 1683. Franklin's *Pennsylvania Gazette* began publication in 1729, and the *Pennsylvania Journal and Weekly Advertiser* was begun in 1742. In 1741 the city, then having 1621 taxable citizens, was divided into 10 wards. In 1723 Benjamin Franklin, who, next to Penn, exerted the greatest influence in the history of the city, came to Philadelphia. In 1747, during King George's War with the French and the Indians, the publication of his *Plain Truth* roused a spirit of military enthusiasm; a force of 10,000 was raised in Pennsylvania, and a battery was erected below the city, on the site of the present United States Navy Yard. In 1751 the first line of packets to New York was established, followed in 1756 by a stage line. Under Franklin's influence, in 1747 the merchants of Philadelphia sent a ship to discover the Northwest Passage. In 1755 a militia bill was passed, and Franklin became colonel of the city regiment.

From 1763 to 1774 Philadelphia was prominent in resisting British aggression, though the Loyalist party was strong and most of the Friends opposed warfare; and here most of the important official events of the Revolution took place. In 1773 (October 17), during the excitement over the expected arrival of the tea ship *Polly*, the people met in mass meeting and passed resolutions which on November 5 were re-adopted at Boston. The first Continental Congress met in Carpenter's Hall, Sept. 5, 1774; the second met May 10, 1775, in the State House. Philadelphia was held by the British from Sept. 27, 1777, to June 18, 1778, and during this period, while the American army was at Valley Forge, the city was the scene of much gayety. On May 18, 1778, the famous entertainment called the *Mischianza* (q.v.) was given in honor of General Howe, who was about to depart for Europe. On Oct. 4, 1777, the battle of Germantown (q.v.) was fought. On May 14, 1787, delegates from the different States met

here and, after almost four months of debate behind closed doors, adopted, September 17, a Constitution for the United States. On March 11, 1789, the city received a new charter from the Legislature. Epidemics of yellow fever in 1793 and 1798 caused great loss of life, at least 4000 dying in the former year and almost 5000 out of the 30,000 who remained in the city in the latter.

During the latter part of the eighteenth century and the early part of the nineteenth Philadelphia was the most important city in America. The historian McMaster says of it in 1784: "The city was then the greatest in the country. No other could boast of so many streets, so many houses, so many people, so much renown"; and Liancourt describes it in 1800 as "not only the finest city in the United States, but . . . one of the most beautiful cities of the world." Philadelphia was the capital of Pennsylvania from 1683 until 1790, the seat of the Federal government from 1790 to 1800, and the monetary centre of the country until 1836. (See BANK, BANKING.) For many years, also, it was the intellectual and literary centre of the country. Here were published the first newspaper in the Middle Colonies, the *American Weekly Mercury* (1719); the first secular magazine in North America, *Ein geistliches Magazin* (1764); the first daily newspaper in the United States, the *Pennsylvania Packet* (1784); the first American edition of the Bible in German (1743) and in English (1781), and the first religious weekly, the *Religious Remembrancer* (1813). The most popular of the early American magazines—the *Port Folio* and the *Analec-tic*—also were published here.

Philadelphia took the lead in the early anti-slavery movement, the first formal protest against slavery in this country being made by four Germans of Germantown in 1688, the first Abolition convention being held here Jan. 1, 1794, on the invitation of the Pennsylvania Abolition Society, and the American Antislavery Society being founded here, under the leadership of Garrison, in 1833. In 1812 the water works at Fairmount were begun and were finished in 1815. In 1832 nearly 1000 deaths resulted from Asiatic cholera. In May, 1838, an anti-Abolitionist mob destroyed Pennsylvania Hall, in which an Abolitionist meeting had just been held. In 1844 occurred the anti-Catholic riots, arising from the demand of the Catholics to be permitted to use the Douai instead of the King James Bible in the public schools. The anti-Catholics, or "Native Americans," burned St. Michael's and St. Augustine's churches and caused much loss of life before they were put down by the militia. Gas was introduced in 1836, and the first telegraph line was established in April, 1846. On Feb. 2, 1854, a consolidation act was passed by the Legislature, extending the city limits to the county boundaries and uniting under one municipal government all the outlying districts, known as Southwark, Northern Liberties, Kensington, Spring Garden, Moyamensing, Penn, Richmond, West Philadelphia, and Belmont; also the boroughs of Germantown, Manayunk, and some outlying townships. The names of the boroughs and townships included in the Consolidation Act of 1854 are commemorated in the elaborate bronze lamp-posts on City Hall Plaza. Philadelphia took an active part in the Civil War and raised more than \$1,000,000

by a sanitary fair in 1864. The centenary of American independence was celebrated in 1876 by the Centennial Exposition, the bicentennial of the landing of William Penn in 1882, and the centennial of the signing of the Constitution in 1887. In 1908 the Historical Pageant Association celebrated the two hundred and twenty-fifth anniversary of the founding of the city.

PHILADELPHIA ACADEMY OF NATURAL SCIENCES. An association founded in 1812 for the purpose of furthering the study of the natural sciences and encouraging original investigation in the various fields of physical research. Its museum is especially rich in ornithological specimens and fossils, and its collection of shells is the finest in the world. The library contains about 80,000 volumes and is especially rich in the transactions of learned societies. The Jessup Foundation provided gratuitous training for a number of young investigators. The society has published a *Journal* since 1817 and its *Proceedings* since 1841.

PHILADELPHUS (Neo-Lat., from Gk. *φιλᾶδελφος*, *philadelphos*, sort of flowering shrub, perhaps jasmine; named in honor of Ptolemy Philadelphus, King of Egypt). A genus of shrubs of the family Saxifragaceæ. Several species are natives of the Southern Atlantic and Pacific States and Japan. *Philadelphus inodorus* grows in the mountains from Virginia southward. *Philadelphus grandiflorus* grows in lower ground in the same region. *Philadelphus hirsutus* ranges from North Carolina to Alabama in the mountains. *Philadelphus gordonianus* and *Philadelphus lewisii* are natives of the Pacific Coast States. The most common and best representative of the genus, however, is *Philadelphus coronarius*, the common mock orange or syringa, much cultivated in gardens. Its native country is not known, but it was probably brought from Japan to southern Europe, where it appears to be thoroughly established. It has erect branches, oblong-ovate leaves, which when crushed have very much the odor and taste of cucumbers. Its creamy-white flowers, borne in large clusters, are well known for their exceeding fragrance.

PHILÆ (Lat., from Gk. *Φιλᾶ*, Coptic *Φιλᾶ*, *hēh*, the corner, extremity, i.e., of Egypt). A celebrated island in the Nile, just above the First Cataract, in lat. 24° 1' N. It is a small granite rock, about 1000 feet long by 500 feet broad, and is covered with ancient buildings of great architectural beauty and interest. By the Arabs it is called *Gezret Anas el Wogūd* (the island of Anas el Wogūd), from the name of the hero of a tale in the *Thousand and One Nights*, the scene of which is laid here. Philæ is not mentioned in the Egyptian inscriptions before the time of Nectanebo II (361-343 B.C.), who constructed the oldest of the buildings that now remain, though it is reasonably certain that a temple existed there in earlier times. The island was especially devoted to the worship of the goddess Isis, but Osiris, Hathor, Khnum, Satet, and other divinities also were worshipped there. In later times, when the cult of Isis had spread through the Greek and the Roman world, many pilgrims of foreign nationality visited the shrine of the goddess at Philæ, and her worship was maintained there long after heathenism had been banished from other parts of Egypt. The great temple of Isis was built by Ptolemy Philadelphus and his successor, Euergetes I, but additions and embellishments were made by other Ptolemies and by several of the Roman emperors, constituting an ensemble of late Egyptian architecture of extraordinary splendor. The approach to the temple is formed by the dromos, a long open space, flanked on its eastern and western sides by colonnaded walks. At the southern end is the hall of Nectanebo II, built about 350 B.C., and near it to the right is the ruined temple of the Nubian deity Arnuphis (Ar-hes-nofer). Beginning from this temple, the eastern colonnade runs northward to the small temple of Imhotep (Asklepios) and terminates near a gate built by Ptolemy Philadelphus, which is adorned with reliefs by that monarch and by the Emperor Tiberius. The western colonnade is pierced by a number of windows which give a good view over the river. It runs along a fine stone quay of ancient construction. At the northern end of the dromos stands the great pylon of Nectanebo II, leading into the outer court, on the eastern side of which are a number of chambers, built for the use of the priests; and on the western side is the birth house, commemorating the birth of Horus. On the walls of the latter building is a copy in hieroglyphic demotic of the text of the Rosetta stone (q.v.). At the upper end of the outer court is a second pylon, which gives entrance to the inner court leading to a hypostyle hall, and from this, through a succession of smaller halls and chambers, to the sanctuary of the goddess Isis and her son Harpocrates (q.v.). In an upper story is a room decorated with scenes from the myth of Osiris (q.v.). The temple is decorated throughout with sculptures and reliefs, which are richly colored and well preserved. West of the temple of Isis, near the river, is a gate built by the Emperor Hadrian and also the temple of Harendotes (Egypt. *Har-nez-yotf*, Horus the avenger of his father). On the eastern side of the island is the small temple of Hathor, built by Ptolemy Philometor and Euergetes II, and near it, close to the river bank, is a beautiful pavilion supported by light and graceful columns, richly adorned with reliefs, popularly known as "Pharaoh's Bed." On the

northern end of the island, among the ruins of the ancient city of Philæ, are the remains of the old Roman city gate, of the temple of Augustus, and of a Coptic church. Since 1903 the completion of the great dam at Assuan (q.v.) has so raised the level of the Nile at Philæ as to submerge the island, except from July to October, when the river is allowed to run freely through the sluices of the dam.

Lyons, *A Report on the Temples of Philæ* (1908); Baedeker, *Egypt* (7th Eng. ed., Leipzig, 1914). See Plate accompanying EGYPTIAN ART.

PHILANDEER. A Dutch knight in Ariosto's *Orlando furioso*, who made love to Gabrina, the wife of his host. His name is used as the synonym of a male coquet in various plays, and is the origin of the verb to philander (to play at love).

PHILANDER SMITH COLLEGE. A co-educational institution for higher education, founded at Little Rock, Ark., in 1877. It is under Methodist Episcopal control. It includes the college, academic department, commercial department, music department, and grammar school. The value of the college grounds and buildings is about \$170,000, and the annual income from all sources is \$120,000. The total enrollment in all departments in 1915 was 491, and instructors numbered 25. A new dormitory for girls, Webb Hall, was completed in 1915. The library contains about 3000 volumes. The president in 1915 was the Rev. J. M. Cox, D.D.

PHILANTHROPY (Lat. *philanthropia*, from Gk. *φιλανθρωπία*, love of humanity, from *φιλάνθρωπος*, *philánthros*, loving humanity). In German educational history, a term applied to the theories of a group of men who based their educational theories upon the teachings of Rousseau. At the head of these was Basedow, who founded an institution, the Philanthropinum, at Dessau in 1774. The only survival of the movement is Salzmann's institution at Schnepfenthal in Gotha, founded in 1784. Consult B. K. Gray, *A History of English Philanthropy* (London, 1905). See BASEDOW.

PHILARET, fé'lá-rét (VASILI MICHAËLOVITCH DROZDOV) (1782-1867). Metropolitan of Moscow. He was born at Kolomna, became a priest in 1808, and in 1812 was made rector of the Theological Academy of St. Petersburg. In 1817 he became Bishop of Revel, in 1819 Archbishop of Tver and a member of the Holy Synod. In 1820 he was transferred to Yaroslavl and in 1821 to Moscow. He received the appointment of Metropolitan of Moscow in 1825. He was noted for learning and eloquence, and drew up the manifesto which led to the abolition of serfdom. He prepared a longer and a shorter catechism, both of which were adopted and promulgated by the Holy Synod in 1839, and the former is considered the most authoritative

doctrinal standard of the Græco-Russian church. Both catechisms have been translated into English by Blackmore in *The Doctrine of the Russian Church* (London, 1845); Blackmore's translation of the longer catechism is reprinted in Schaff, *The Creeds of Christendom*, vol. ii, pp. 445-542. A volume of Philaret's *Select Sermons* in English translation has also been published (London, 1873), with a brief biography. He began a translation of the New Testament into Russian, completed after his death.

PHILASTER; OR, LOVE LIES A-BLEEDING. A tragedy by Beaumont with some assistance from Fletcher; one of the best known of their joint plays. It was produced not later than 1611 (as John Davies alludes to it in his *Scourge of Folly*) and was printed in 1620. Among several versions produced one by Colman was played in 1764.

PHILATELIC (fil'á-tel'ík) **SOCIETY**, **AMERICAN** (from Gk. *φίλος*, *philos*, loving, from *φιλεῖν*, *philein*, to love + *τέλος*, *telos*, free of tax, prepaid, from *α-*, *a-*, not + *τέλος*, *telos*, tax, duty). A national society of postage-stamp collectors, founded in 1886, meeting annually in such cities as may be selected and having local branches in Chicago, San Francisco, Cleveland, Detroit, Buffalo, Richmond (Va.), Omaha (Neb.), Saginaw (Mich.), Los Angeles, Berkeley (Cal.), Louisville (Ky.), Columbus (Ohio), St. Louis, Pittsburgh, Philadelphia, Springfield (Mass.), Baltimore, Rochester (N. Y.), and Honolulu (Hawaii). It has a membership exceeding 1400, living principally in the United States, but with many members in all parts of the world. Its objects are to bring together those interested in philately and to study that subject through the aid of exhibitions of stamps and the association of its members. It conducts various departments having in view the benefit of its members. It was organized Sept. 14, 1886, and was incorporated under the laws of the State of Minnesota, April 3, 1897. Its affairs are under the management of a board of nine directors, elected annually. The society publishes its own official journal, the *American Philatelist*, issued semimonthly and sent free to all members. In addition it issues handbooks relating to stamp collecting.

PHILATELIC SOCIETY OF LONDON. An English association of collectors of postage stamps, founded in London in 1869, the first of its kind. Its objects are the study of postage stamps, their history and manufacture, the detection of forgeries, the exhibition of stamps, and the publication of works on these subjects. The membership includes many collectors in the English colonies and on the Continent. The society has conducted two international philatelic exhibitions. It has also published expensive volumes on the stamps of Great Britain, of the British colonies, of India and Ceylon, and of Africa, and issues its proceedings in the *Monthly Journal*.

PHILATELY. See POSTAGE STAMPS.
PHILBRICK, JOHN DUDLEY (1818-86). An American educator, born in Deerfield, N. H. He was graduated at Dartmouth College in 1842 and afterward taught in Boston for 10 years. In 1853 he became principal of the Connecticut Normal School and in 1855 superintendent of schools in that State. From 1857 to 1874 and again from 1876 to 1878 he was superintendent of the Boston public schools. He was sent to the Vienna Exposition of 1873 as educational

commissioner from Massachusetts, and acted as a member of the international jury. After his return he became president of the National Teachers' Association and was officer of many educational societies. He prepared a valuable report on *City School Systems in the United States* (published by the United States Bureau of Education in 1885) and edited the *Connecticut Common School Journal* and the *Massachusetts Teacher*.

PHILEMON (Lat., from Gk. Φίλων) (c.361-283 B.C.). A Greek comic poet, a native of Soli in Cilicia or of Syracuse in Sicily. He resided chiefly in Athens, but for a time also in Alexandria at the court of Ptolemy Philadelphus. He and Menander were the two representative poets of the Attic New Comedy. Philemon gained more prizes than Menander. Posterity, however, reversed the decision, and Menander and Homer were the two favorite poets of later Greece. Of the 97 comedies of Philemon 57 are known to us from titles and fragments, while two at least, the *Ευροπος* and the *Θυραυρὸς*, are preserved in Plautus's adaptations, the *Mercator* and the *Trinummus*; and it is probable also that Plautus's *Mostellaria* follows Philemon's *Φάσμα*. The fragments were published by Koch, *Comicorum Atticorum Fragmenta*, vol. ii (Leipzig, 1886). In 1902 a new fragment of Philemon was found by Grenfell and Hunt and published in *The Hibeh Papyri*, part i (Oxford). Consult C. A. Dietze, *De Philemone Comico* (Göttingen, 1901).

PHILEMON. A friend beloved of the Apostle Paul, to whom he wrote the letter which is now preserved in the New Testament under Philemon's name. From this letter it appears that he was a rich man who probably lived at Colossae, owned slaves, was noted for his hospitality, and had become a Christian under Paul's influence. There are legendary accounts of Philemon's later accession to the bishopric of Colossae and of his martyrdom there under the Emperor Nero.

PHILEMON, EPISTLE TO. One of the Epistles of the New Testament and the only letter of Paul written to an individual on a purely private matter that has been preserved. In it Paul appeals to his friend Philemon in behalf of Onesimus, a fugitive slave, who, under the influence of Paul, had become a convert to the Christian faith. This fugitive Paul sends back to his master with a letter praying for the culprit's pardon and even hinting at emancipation. The letter was, almost without doubt, written during Paul's first imprisonment in Rome (c.58-60 A.D.). The special value of the letter consists not only in the light it throws on Paul's attitude towards slavery as it then existed in the Roman Empire, but also in the beautiful exhibition of Christian courtesy and a fine sense of honor on Paul's part, in which respect it is unparalleled among the writings of antiquity. Consult: Ellicott, *Philippians, Colossians, and Philemon* (Andover, 1865); Lightfoot, *Colossians and Philemon* (1876); Von Soden in *Hand-Commentar zum Neuen Testament*, vol. iii (Freiburg, 1893); H. C. G. Moule, *Colossians and Philemon*, in *Cambridge Bible for Schools and Colleges* (Cambridge, 1894); M. R. Vincent, *Philippians and Philemon*, in *International Critical Commentary* (New York, 1897); G. C. Martin, in *New Century Bible* (ib., 1902); Alexander MacLaren, *Colossians and Philemon*, in *Expositor's Bible* (ib.,

1903); James Moffatt, *Introduction to the Literature of the New Testament* (ib., 1911).

PHILEMON AND BAUCIS, βαΐσις. According to a myth related by Ovid in his *Metamorphoses*, viii, 610-715, a pair of poor Phrygian peasants. Jupiter and Mercury, wandering through Phrygia in human form, were hospitably entertained by them, after all the neighborhood had turned the wanderers from their doors. On going away the gods took the pair with them to a neighboring mountain, whence they saw their village covered with a flood, but their own cottage changed into a splendid temple. Jupiter permitted them to make any request they chose, but they only asked to be servants of his temple and to die at the same time. Therefore in their extreme old age the gods transformed Philemon into an oak and Baucis into a linden, which long stood in front of the temple and were honored by the people. The story, which has been much elaborated by Ovid, contains two elements common in popular tales—the rescue from a flood by divine interposition and the reward for hospitality to supernatural visitors in disguise. The vitality of the legend in Phrygia seems emphasized by the experience of Paul and Barnabas at Lystra (Acts xiv).

PHILETAS (Lat., from Gk. Φίλητας), or **PHILITAS**, of Cos. A Greek grammarian and poet who lived about the close of the fourth century B.C., tutor to Ptolemy II Philadelphus of Alexandria. His poems, which were chiefly elegies devoted to the praises of his mistress, Battis, were ranked next to those of Callimachus by the Alexandrian critics, and were imitated by Propertius. He wrote epics also, and notes on Homer, and a vocabulary, called *Ἀρακτα*, in which he explained rare and obscure and dialectal words. The scanty fragments that remain have been published by Bach (1829). Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

PHILHARMONIC SOCIETIES (from Gk. φιλεῖν, *philein*, to love + ἁρμονία, *harmonia*, harmony). Organizations formed for the cultivation of orchestral music. The four most important are those of London, New York, Vienna, and Berlin.

London. This is the oldest association of orchestral performers in England. In 1813 a number of music lovers founded the Philharmonic Society and the first concert was given March 8 of that year. According to the constitution only concerted pieces were to be performed; all soli and concertos were excluded. But when a little later some of the members formed quartets the society ceased to perform chamber music at its concerts and restricted itself to instrumental works for orchestra. In 1820 the term "conductor" (q.v.) appears for the first time upon the programmes, and it designated the person at the piano. After 1821 the conductor stood before the orchestra and directed by means of a baton. Since 1869 the organization has published analytical programmes for its concerts, at which the most eminent instrumental and vocal artists of their time have appeared. Up to 1908 the concerts were directed by a regular conductor for the season. Unfortunately the choice usually fell on distinguished composers who had few qualifications of eminent conductors. Under the last regular conductor, Sir F. Cowen (1900-07), the concerts fell off to such an extent that

rumors of a dissolution began to spread. The board of directors then adopted the policy of inviting the most famous European conductors, and this system of guest conductors has been the rule since 1908. In 1913 the society celebrated the centenary of its existence with a series of splendid festival concerts.

New York. The Philharmonic is the oldest permanent orchestral association in New York. It was founded in 1842, the first concert taking place December 7 of that year. From the beginning it consisted of professional musicians only. As an educational factor the Philharmonic Society has been of greater importance in the musical life of America than any other organization, with the possible exception of the Boston Handel and Haydn Society. (See CHORAL SOCIETIES.) Up to 1865 various members of the orchestra acted as conductors. In that year a conductor for the season was chosen, the first being Carl Bergmann, who directed the concerts until 1876. After Dr. Leopold Damrosch (q.v.) had been conductor for one season, Theodore Thomas held the post from 1877 to 1890. He was succeeded by Anton Seidl. From 1898 to 1902 Emil Paur was conductor, and this period was marked by the production of an unusual number of new works, especially of the Neo-German school. In 1902 Walter Damrosch was conductor. For three seasons (1903-06) the policy of having famous guest conductors was followed, without, however, producing the results expected. From 1906 to 1909 Safonov (q.v.) guided the destinies of the society. The society had now reached a critical point of its existence. The steady deterioration in the quality of the performances was not owing to the conductors, but to the large numbers of superannuated players. In 1909 a number of music lovers raised a fund of \$100,000 on condition that the society be entirely reorganized. Gustav Mahler was appointed conductor and was vested with autocratic power. He reduced the orchestra from 125 to 100 efficient players, and rehearsed daily during a season of 23 weeks. The results of this change were noticeable almost at once. When Mahler died, in 1911, he was succeeded by Josef Stransky (q.v.), who realized the dream of his distinguished predecessor, so that the organization is now the equal of the famous Boston Symphony Orchestra. In 1912 Joseph Pulitzer (q.v.) in his will bequeathed the sum of \$1,000,000 to the Philharmonic society, dependent on certain conditions tending towards the highest efficiency in orchestral playing. These conditions were considered fulfilled in 1914, when the full amount was paid to the society.

Vienna. The society known as Philharmonische Gesellschaft was founded in 1842 by Otto Nicolai, at that time conductor at the Imperial Opera. As the Gesellschaft der Musikfreunde (q.v.) was fast degenerating, there was positive need of an organization that would give artistic performances. The first concert of the new society took place Nov. 27, 1842, and the venture immediately met with great favor and pecuniary success. The programmes consisted generally of two symphonies, with smaller works. Instrumental solos, however, were not permitted. When Nicolai accepted an engagement in Berlin, in 1847, the Philharmonische Gesellschaft almost came to an end. In fact, no concerts were given from 1850 to 1854. Then Carl Eckert reorganized the or-

chestra, and in 1860 the energetic Otto Dessoff succeeded in bringing the orchestra to a high degree of perfection. Since then the Philharmonische Concerte have stood invariably for musical progress. The conductor in 1902 was Hans Richter, under whose leadership the society established its reputation as one of the foremost orchestral institutions of the world. From 1903 to 1908 the society adopted the policy of inviting the most famous European conductors as guests. In 1908 Weingartner (q.v.) became regular conductor.

Berlin. The Berlin Philharmonic Society was founded by Edward Rietz (1802-32). This orchestra at first consisted of about 40 instruments, but the number was subsequently increased and the organization now ranks with the best orchestras of Europe. Its concerts are given in the Philharmonic. It was the first regular symphony orchestra that inaugurated a regular series (besides the severe symphony concerts) of concerts of lighter character at popular prices. This policy met with such favor that the members were obliged to remain together the whole summer to give similar concerts. This overwork made itself felt before long in the deterioration of the quality of the regular symphony concerts, and matters came to a crisis when Nikisch appeared as a rival with his famous Elite Concerts. In order to relieve the Philharmonic Society from excessive strain, the city of Berlin, in 1912, granted an annual subvention of 80,000 marks, on condition that the excessive number of summer concerts be reduced.

PHILHELLENES, fil-hè'lénz (from Gk. φιλέλλην, *philellên*, friend of the Greeks, from φιλεῖν, *philein*, to love + Ἕλλην, *Hellên*, Greek). A name given to those who were friendly to the modern Greeks in their struggle for independence. They were constituted into associations for the purpose of receiving and distributing gifts in aid of those engaged in the contest. The members came from all countries, and included such men as Byron, King Louis I of Bavaria, and a body of volunteers who fought for the Greeks under the leadership of General Normann.

PHILIDOR, ANNE DANICAN (1681-1728). A French composer, born in Paris. More important than his compositions are the services he rendered to the cause of public concerts through the establishment of the Concerts Spirituels (q.v.). His works include the operas *L'Amour Vainqueur*, *Diane et Endymion*, *Danaë*. See CONCERT.

PHILIDOR, FRANÇOIS (1726-95). A French composer and chess player, born at Dreux. His real name was François André Danican. Although he received a thorough musical training under Campra, he devoted his energies to chess, at which game he excelled to such an extent that he soon was world-famous. His love for music, however, could not be suppressed, and when two one-act operas, *Blaise le savetier* and *L'Huitre et les plaideurs*, met with more than ordinary success in 1759, he devoted himself entirely to dramatic composition, and for several decades remained the chief representative of French opéra comique. Of his 25 operas the most important are *Le maréchal ferrant* (1761), *Le sorcier* (1764), *Ernêlinde* (1767), *Les femmes vengées* (1775), *Verée* (1780), *La belle esclave* (1787). He wrote also a requiem in memory of Rameau.

PHILIP (Gk. Φίλιππος, *Philippos*, lover of

horses, from *philein*, *philein*, to love + *ἵππος*, *hippos*, horse), THE APOSTLE. One of the 12 disciples of Jesus. He was of Bethsaida (q.v.) and thus a fellow townsman of Andrew and Peter, and is quite likely to have been with them a follower of John the Baptist before he was called directly to become a disciple of Christ. (John i. 43, 44.) He and Andrew alone among the Apostles had Greek names, which may indicate that they were of Greek descent (cf. John xii. 20-22), a fact not impossible even in the population of the Jewish Bethsaida, as distinguished from the Greek Bethsaida Julias near by. He does not figure extensively in the records of the ministry of Jesus. The only notices which we have of him, apart from the Apostle lists in the Synoptic Gospels and the Book of Acts, are given us in the Fourth Gospel (i. 43-48; vi. 5, 7; xii. 21, 22; xiv. 8, 9), and these show him to be a man of quick appreciation of the religious element in Jesus' mission (John i. 43, 45 f.), but of not much confidence in its application to the problems with which he was confronted. (John vi. 5 f.; xii. 20-22; xiv. 7-11.) His work after the death of Christ is involved in traditions which at times confuse him with Philip the Evangelist. (Cf. Eusebius, *Hist. Eccles.*, iii, 31.) There are two apocryphal works bearing his name, the *Journeyings of Philip the Apostle* and the *Acts of Philip*. They are of slight historical value. Tradition of the safer sort assigns his labors to the region of Hierapolis in Asia Minor. The manner of his death and its date are both unknown.

PHILIP, THE EVANGELIST. One of the seven chosen by the first Christian church in Jerusalem to be the stewards of its charity to the widows and poor. (Acts vi. 5.) It is likely that he was a Hellenist, as were others of the group. Later he engaged in missionary activity, his initial work being among the Samaritans. (Acts viii. 4-5.) This was the first step outward from the limits of a Jewish cult for the new Christian faith. A second step was taken when Philip gave baptism to an Ethiopian eunuch. (Acts viii. 26-40.) He finally settled in the region of Cæsarea, on the coast, where Paul was entertained at his house. (Acts xxi. 8.) His four virgin daughters were reputed to have the gift of prophecy. (Acts xxi. 9.) Tradition is not clear concerning his life after this, confusing him with the Apostle Philip. He appears to have removed finally to Asia Minor, living possibly at Hierapolis and also at Tralles. Consult H. Cowan, in *Hastings, Dictionary of the Bible*, s. v.

PHILIP, THE TETRARCH. See HEROD.

PHILIP II (382-336 B.C.). King of Macedonia and father of Alexander the Great. He was born at Pella and was the youngest son of Amyntas II and Eurydice. When a youth he was taken by Pelopidas as a hostage to Thebes, where he lived several years. After the murder of his eldest brother, Alexander, by Ptolemy Alorites, he was appointed by his brother Perdiccas, when the latter, having slain Ptolemy, came to the throne, to the governorship of a separate district of the country. About 359 B.C. Perdiccas was slain in battle while fighting with the Illyrians, and Philip assumed the government as guardian of his young nephew, Amyntas, the son of Perdiccas; but he soon set aside Amyntas and took the crown himself. At this time Macedonia was attacked on one side by the Illyrians, Pannonians, and other tribes, and on

the other by the Athenians, while within she was torn by the dissensions of several pretenders to the throne; but, buying off the Thracians, who were supporting the pretender Pausanias, conciliating the Athenians, who had taken up the cause of another pretender, Argæus, killing or otherwise disposing of the remaining pretenders, and defeating in battle the threatening tribes, Philip firmly established himself on his throne in less than two years. Henceforth his policy was one of aggression, and the Greek towns on the coast of Macedonia were the first objects of attack. Amphipolis, Pydna, and Potidæa, Athenian possessions or allies on the coast of Macedonia, were the first places to fall into his hands. He then secured possession of the rich and valuable gold mines of Thrace, together with the town of Grenides, which he enlarged and called by the name of Philippi. These victories had all been obtained before 355; in 354 he took Methone, on the Thermaic Gulf, after a long siege, in the course of which he lost an eye, and then advanced into Thessaly, to aid the Aleuadæ against Lycophron, the tyrant of Phæræ. Defeating the force that was sent to oppose him, he established his supremacy throughout Thessaly and advanced as far south as the pass of Thermopylæ. The pass being guarded by a strong force of Athenians, who had been aroused by the eloquent warnings of Demosthenes, he returned and directed his arms against Thrace, where he succeeded in establishing his ascendancy. In 349 he began his attacks on the Chalcidian cities, and in 347 completed the conquest of the Chalcidic peninsula by taking the city of Olynthus. In 346 he succeeded in gaining a further foothold in Greece, being called in by the Thebans to assist in the Sacred War against the Phocians. All the towns of Phocis, numbering 22, together with the pass of Thermopylæ, surrendered to Philip without resistance. The place which the Phocians had occupied in the Amphictyonic Council was transferred to him, and he was appointed, jointly with the Thebans and the Thessalians, president of the Pythian games. In the following years he was again in Thrace, endeavoring to bring the cities in that country under his rule. He was unsuccessful in his attempt on Perinthus and Byzantium, and turned his attention once more to the northern tribes. In 339 B.C. he was again invited into Greece, this time by the Amphictyonic Council, to take charge of the army that was to oppose the Locrians. Alarmed at Philip's continued successes and by his entrance into Greece, the Athenians formed a coalition with Thebes and other Greek States to oppose his advance, but the united army was utterly defeated at the battle of Chæronea in 338. This battle marks the end of Greek independence; Philip was now master of Greece. He at once began preparations for the invasion of Persia on a grand scale. In 337, when deputies from all the different states of Greece except Sparta assembled at Corinth, he was chosen commander in chief of the Greek forces. In the midst of his preparations, however, he was assassinated at *Ægæ* by a youth of noble blood named Pausanias, while attending a celebration in honor of the marriage of his daughter with Alexander of Epirus (336 B.C.). The motive for the deed, as stated by Aristotle, was private resentment for neglect on Philip's part to punish Attalus for a gross insult offered to

Pausanias. Consult the histories of Greece by Abbott, Holm, Busolt, etc.; D. G. Hogarth, *Philip and Alexander of Macedon* (1897); A. W. Pickard-Cambridge, *Demosthenes and the Last Days of Greek Freedom* (New York, 1914). See GREECE, *History, Ancient History*.

PHILIP III. A king of Macedonia. See ARRHIÆUS.

PHILIP V (237-179 B.C.). King of Macedonia, son of Demetrius II and grandson of Antigonus Gonatas. He succeeded his uncle Antigonus Doson in 220. The first part of his reign was disturbed by the contentions of the Ætolian and Achaean leagues; taking part with the latter, he conducted the war for several campaigns with ability and success. (See ACHÆA; ÆTOLIA.) This war was called the Social War and was concluded in 217 by the Peace of Naupactus. In 216-215 Philip was induced by the successes of Hannibal in Italy to conclude an offensive and defensive alliance with Carthage, the price of which was to be the Roman possessions in Illyria and the help of Carthage in his Grecian wars. The war which followed (214-205) is known as the First Macedonian War; at no time in the course of it did Philip render Hannibal any effective aid, and for the first three years the war was conducted on both sides with lack of energy. In 214 the Roman general, M. Valerius Levinus, compelled Philip to raise the siege of Apollonia, and in 211 Rome organized against Macedon a coalition of Greek states with the Ætolian League at the head. Peace was concluded in 205 without material gain on either side. In 204 Philip made a bargain with Antiochus III to divide between them certain of the dominions of the youthful King of Egypt, Ptolemy Epiphanes. This interference of Philip in the East precipitated the Second Macedonian War with Rome, which began in 200 and was brought to a close by the battle of Cynoscephalæ in 197. In this battle the Macedonian army was utterly defeated by Titus Quintius Flamininus; Philip was compelled to relinquish his conquests in Europe and Asia, to surrender his fleet, and to pay an indemnity of 1000 talents; Macedonia became an ally, subject to the control of Rome. Philip died in 179 and was succeeded by his son Perseus. Consult: Johannes Droysen, *Geschichte des Hellenismus* (2d ed., Gotha, 1877-78); J. P. Mahaffy, *Alexander's Empire* (New York, 1888); E. A. Freeman, *History of Federal Government* (2d ed., ib., 1893); "Philippos, 4" in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

PHILIP I (1052-1108). King of France from 1060 to 1108. He was the eldest son of King Henry I and Anne of Russia. Until 1066, when Philip came of age, his mother and his uncle, Baldwin V of Flanders, were regents. In the various contests of his great feudatories, to whom belonged William I of England as Duke of Normandy, Philip often intervened successfully, so that the royal domain was increased until it extended from the valley of the Seine to the valley of the Loire and also included Bourges. About 1071 Philip married Bertha, stepdaughter of Count Robert of Holland. Though a son was born to them in 1081 (later Louis VI), and afterward a daughter, Philip repudiated his wife in 1092 and began to live with Bertrada, the wife of Count Fulk of Anjou. The result was a continuous strife between the

papacy and the King. In 1095, at the Council of Clermont, Urban II excommunicated Philip, though Bertha had died in 1094. This excommunication was raised, in 1104, after Philip had promised to put Bertrada away. Consult: E. A. Freeman, *Norman Conquest*, vol. iv (New York, 1873); id., *William Rufus*, vol. ii (Oxford, 1882); Bernard Monod, *Essai sur les rapports de Pascal II, avec Philippe I* (Paris, 1907).

PHILIP II, or PHILIP AUGUSTUS (1165-1223). King of France from 1180 to 1223. He was the son of Louis VII and Adèle of Champagne and was born Aug. 21, 1165. He was crowned Nov. 1, 1179, in the lifetime of his father, succeeded him in 1180, and proved one of the greatest monarchs of the Capetian dynasty. In 1181 he made war upon the Count of Flanders and in 1185 forced him to surrender the districts of Vermandois and Amiénois. In 1182 he drove the Jews out of his territories and confiscated all their wealth. In 1187 the English attempt to conquer Languedoc caused a war, in which Philip was aided by the sons of Henry II (q.v.). After the accession (1189) of Richard to the English throne, Philip and he set out together on the Third Crusade (1190), but quarreled while wintering in Sicily, and, their dissensions continuing, Philip, after a sojourn of three and a half months in Syria, set out on his return to France, after taking a solemn oath to respect the integrity of Richard's dominions. No sooner, however, had he returned than he entered into an arrangement for the partition of Richard's territories in France with his unworthy brother, John. Some acquisitions were made, but Richard's return thwarted the calculations of the conspirators, and a war immediately began between the two monarchs, in which Philip had at one and the same time to defend his territories against the English and the counts of Blois, Boulogne, Flanders, and Toulouse, who attacked them on all sides. Richard died in 1199; but on the appeal of the barons of Poitou to Philip, as John's overlord, the war was soon resumed against John (q.v.). The English provinces in France were attacked by the combined French and Bretons, and Normandy, Poitou, Maine, Anjou, and Touraine were annexed to France. In the years 1213 and 1214 Philip waged war against Flanders and thus caused a coalition to be formed by Otho IV (q.v.) of Germany, John of England, and the Count of Flanders. Philip defeated the allies in 1214 at Bouvines (q.v.). During the rest of his reign Philip was occupied in consolidating his new possessions, and took no part in the war against the Albigenes. In general, Philip was in alliance with the Church and the great cities. His first wife was Isabella of Hainault, the mother of Louis VIII; he next married Ingeborg of Denmark, but repudiated her to marry Agnes of Meran. For this he was excommunicated and France was placed under an interdict. Philip yielded in 1200 and took back Ingeborg, but she was not recognized as Queen till 1213. He improved and embellished Paris, built many churches and other institutions, encouraged commercial associations, and gave the first charter to the University of Paris. He fortified many of the chief towns, including the capital. He died at Mantes, July 14, 1223. Philip was the first monarch under whom France attained a commanding position in Eu-

rope. Consult: Achille Luchaire, *Philippe Auguste* (Paris, 1881); W. H. Hutton, *Philip Augustus* (London, 1896); Alexander Castelletti, *Philipp II August* (3 vols., Leipzig, 1899-1910); Ernest Lavisse, *Histoire de France*, vol. iii, part i (Paris, 1901); Edouard Audouin, *Essai sur l'armée royale au temps de Philippe Auguste* (ib., 1913).

PHILIP III, LE HARDI, i.e., the Bold (1245-85). King of France from 1270 to 1285. He was the son of Louis IX, and had his father's piety, but not his ability. He was an unimportant man personally, led by his favorites, who were of low birth, or by his wife and his mother, who antagonized each other, or by his uncle Charles of Anjou. Consult C. V. Langlois, *Le règne de Philippe III le Hardi* (Paris, 1887), and Ernest Lavisse, *Histoire de France*, vol. iii, part ii (ib., 1901).

PHILIP IV, THE FAIR (1268-1314). King of France from 1285 to 1314. He succeeded his father, Philip III. During his reign, which was of exceeding importance for the development of the French monarchy, he had three prominent advisers, Pierre Flotte, William of Nogaret, and Enguerrand of Marigny, who, being all taken from the rising legal class, were known as *légistes*. The event that stands out most prominently in this reign was the conflict with the papacy under Boniface VIII (q.v.). The French government sought to tax the clergy, whereupon Boniface interfered and issued the bull *Clericis laicos* in 1296, forbidding the clergy to pay taxes to the King. Boniface, it is true, gave way at once when a decree was issued forbidding the exportation of metals from France, the effect of which would have been to cut off a large portion of the papal revenue, but the success of the Jubilee at Rome in 1300 induced Boniface to believe that he would find sufficient support in a struggle with Philip IV, and hence when in 1301 Bernard Saisset, Bishop of Pamiers, a papal representative in France, was arrested there, Boniface issued his famous bull *Unam sanctam*. This set forth the highest papal pretensions and was a challenge to all monarchs of Europe. Philip, in order to be certain of support, summoned the States-General for the first time in the history of France. In 1303 while Boniface was at Anagni he was suddenly captured by William of Nogaret, and, though released the following day, he died soon after that as a result of the shock. After the short rule of Benedict XI Philip obtained in 1305 the election of his adherent, the Archbishop of Bordeaux, to the papal chair, as Clement V. In 1309 the Pope took up his residence at Avignon, and until 1378 the papacy was entirely under French influence, this being the period of the so-called Babylonish Captivity. See PAPACY.

On account of the increased expenditures of the monarchy because of its greater extension and enlarged duties, it was found more and more difficult to carry on the government with the old revenues alone. A temporary expedient was found by compelling Clement V to condemn the wealthy Templars and deliver their property over to the French King. Early in his reign Philip had difficulties with Edward I of England. In 1294 he took possession of Guienne, Edward's territory, and in 1297 attacked Guy, Count of Flanders, who had supported the English monarch. Boniface VIII brought about a truce in 1298, between France

and England, and Guienne was restored to Edward; but Guy of Flanders was not included and Philip occupied Flanders in 1300-1301. His officials treated the wealthy Flemish cities so harshly that they revolted under Peter of Koninck. Philip's army was decisively defeated at Courtrai (q.v.) in 1302, and in 1305 he made peace, restoring Flanders to the son of Count Guy.

Scholars have long disputed concerning the true character of Philip. On the one hand he has been represented as an avaricious, scheming monarch; on the other as a mild man, who was completely in the hands of bold councilors. But concerning the results of his reign there is no question. Feudal usages were restricted, and the power of the crown was vastly extended. In order to meet the financial needs of the state, the taxes were increased, the Jews persecuted and their property confiscated; and when these means were insufficient the coinage was debased. Philip's wife was Jeanne, Queen of Navarre, through whom the latter country was annexed to France. Philip and Jeanne's three sons, Louis X, Philip V, and Charles IV, were in succession Kings of France and Navarre.

Edgard Boutaric, *La France sous Philippe le Bel* (Paris, 1861); Frantz Funck-Brentano, *Les origines de la Guerre de Cent Ans: Philippe le Bel en Flandre* (ib., 1897); Ernest Lavisse, *Histoire de France*, vol. iii, part ii (Paris, 1901); Richard Scholz, *Die Publizistik zur Zeit Philipps des Schönen und Bonifaz VIII* (Stuttgart, 1903); Karl Wenck, *Philipp der Schöne von Frankreich* (Marburg, 1905); Heinrich Finke, *Papsttum und Untergang des Templerordens* (2 vols., Münster, 1907); also *Cambridge Modern History*, vol. i (New York, 1902).

PHILIP V, LE LONG, i.e., the Tall (1293-1322). King of France from 1316 to 1322. He was the second son of Philip IV, and on the death of his brother, Louis X, was made Regent, as the Queen was with child. Her son died four days after birth and Philip proclaimed himself King. Many opposed him, supporting the claims of his niece, the daughter of Louis X. An assembly of nobles, prelates, and citizens, summoned by Philip in 1317, declared that women could not succeed to the throne. (See SALIC LAW.) In 1320 a large number of peasants, known as Pastoureaux, led by some renegade clerks, demanded to be taken on a crusade. They committed horrible outrages, especially the massacre of Jews, but were finally suppressed. Philip's reign is noteworthy for its many administrative reforms. He centralized the treasury receipts at Paris, suppressed the garrisons in castles not on the frontiers, confiscated for the crown many feudal rights of taxation enjoyed by the nobles, and organized the army more efficiently. In other attempted reforms he was thwarted by opposition from the States-General. Consult Paul Lehugeur, *Histoire de Philippe le Long* (Paris, 1897), and Ernest Lavisse, *Histoire de France*, vol. iii, part ii (ib., 1901).

PHILIP VI (1293-1350). King of France from 1328 to 1350, the first King of the house of Valois. He was the son of Charles of Valois, younger brother of Philip IV. At first Regent of France on the death of Charles IV, the proclamation of a king being deferred on account of the pregnancy of Charles IV's widow, he was crowned at Rheims on May 29, 1328, after

the Queen had given birth to a girl. His right to the throne was denied by Edward III of England, the grandson of Philip IV, who declared that females, though excluded from the throne by custom (see *SALIC LAW*), could transmit their rights to their children, and therefore insisted upon the superiority of his own claims. Philip's reign began gloriously, for, marching into Flanders to support the Count against his rebellious subjects, he wiped out the disgrace of Courtrai by vanquishing the Flemings at Cassel, Aug. 23, 1328. His next great project was a crusade, for which he took the cross in 1332. At the beginning of 1336 the crusade seemed certain, but the relations with England were very strained, and in 1337 the Hundred Years' War (q.v.) began. It was carried on languidly for several years, the only prominent incident being the destruction of the French fleet off Sluys, June 24, 1340. Philip was very extravagant and delighted in maintaining a brilliant court. The round of fêtes and tournaments never was interrupted, even when the war had well-nigh exhausted the wealth of the country, for the money to carry them on was provided by some new tax, by an arbitrary change in the coinage, or by some fresh confiscation. In 1346 Edward III landed in Normandy, ravaged the country to the environs of Paris, and defeated Philip at Crécy (q.v.). The following year Edward captured Calais. A truce was concluded by papal mediation, in 1347, but the Kingdom had no sooner been released from war than destruction in another and more terrible form, that of the black death (q.v.), appeared. Nevertheless the extravagance at the court was as great as ever. At Philip's accession the royal domain was increased by the possessions of Valois, Chartres, Anjou, and Maine; later MontPELLIER and Dauphiné were added. But Philip gave Navarre to Jeanne, daughter of Louis X, and also Angoulême and Mortain, thus diminishing the crownlands to this extent. Consult Ernest Lavisse, *Histoire de France*, vol. iv, part i (Paris, 1902), and Auguste Molinier, *Les sources de l'histoire de France*, vol. iv (ib., 1904). These works contain extensive bibliographical references for the many subjects involved. See *FRANCE, History*.

PHILIP II (1527-98). King of Spain from 1556 to 1598. He was born at Valladolid on May 21, 1527, the only son of the Emperor Charles V (q.v.). His education was chiefly in the hands of the clergy and he grew up a cold and bigoted man. In 1543 he was married to Maria of Portugal, and upon her death he espoused in 1554 Mary I of England (q.v.). In 1555 Charles V surrendered the government of the Netherlands to Philip, and in the following year resigned also the crown of Spain to his son, who had been previously invested with the sovereignty of Naples, Sicily, and Milan. The possessions of Spain in the New World included the West Indies, Mexico, and a great part of South America. The early part of the reign of Philip proved very successful. He defeated a coalition formed against him by the Pope and France, his armies winning several battles, notably that of Saint-Quentin (1557), and France was compelled to sign on April 2-3, 1559, the Treaty of Cateau-Cambrésis (q.v.), which marked the abandonment of her rôle as an aggressive power on the side of Italy. Philip determined to stamp out opposition to

Roman Catholicism in all his dominions, and this caused the revolt of the Netherlands (q.v.). This successful rebellion and the enormous expenses it entailed upon Spain ruined the prosperity of Philip's dominions. The naval supremacy of Spain, moreover, was shattered by the defeat of the Armada (q.v.), which Philip had sent against England in 1588. Besides the war against England Philip was led by the affairs in the Netherlands to interfere also in the concerns of France. He has been sometimes accused of having instigated the Massacre of St. Bartholomew, and he supported the Guises against Henry of Navarre (later Henry IV), but all in vain. On May 2, 1598, the Treaty of Vervins (q.v.) was concluded with France. Against the Turks Philip was more successful. They were decisively defeated in 1571 by his half brother, John of Austria, commanding the fleet of the Holy League (Spain, Venice, the Papal States), at Lepanto (q.v.). Portugal was conquered by Philip's general, the Duke of Alva (q.v.), after the direct male line of that country had become extinct in 1580. But these successes were unable to outweigh the ruin of Spanish commerce and industry. Philip died after a lingering illness on Sept. 13, 1598. After the death of Mary of England in 1558, Philip married in 1559 Elizabeth, the daughter of Henry II of France, and when she died in 1568 he married Anna, a daughter of the Emperor Maximilian II. By his first wife Philip had a son, the celebrated Don Carlos (q.v.), and by his fourth wife, his successor, Philip III (q.v.). Philip II's character has been the subject of considerable historical controversy. There can be little doubt that he was bigoted and morose, but, on the other hand, the popular view, which represents him as a cruel monster, is a false one. He seems to have been an idealist and a visionary, who believed firmly that he was benefiting humanity by his drastic measures. He was often open to appeals for mercy and leniency, but the Inquisition was not only permitted a free sway in Spain, but was carefully developed by Philip as a powerful means of support in his various quarrels with the Church, and all liberty was crushed.

Hume, *Spain: Its Greatness and Decay, 1479-1788* (New York, 1905); id., *Two English Queens and Philip* (ib., 1908). See *SPAIN*.

PHILIP III (1578-1621). King of Spain from 1598 to 1621. He was the son of Philip II, and is to be remembered chiefly for accelerating the ruin of Spain, which had begun under his father, by turning the entire government over to his favorites, the Duke of Lerma and the son of the latter, the Duke of Uceda, and by driving out in 1609 and 1610 the Moriscos (q.v.), the most industrious and thrifty inhab-

itants of Spain. Consult H. C. Lea, *The Moriscos of Spain* (Philadelphia, 1901), and M. A. S. Hume, *Spain: Its Greatness and Decay, 1478-1788* (New York, 1905).

PHILIP IV (1605-65). King of Spain from 1621 to 1665. He took little part in the affairs of government, which from 1623 to 1643 were in the hands of his favorite Olivares (q.v.). In spite of the latter's efforts for the encouragement of trade and industry, the decline of Spain was hastened by exhausting wars in Germany and with France. In 1640 Portugal conquered its independence, and by the Treaty of Westphalia Spain acknowledged the independence of the Netherlands. The Peace of the Pyrenees in 1659 was highly favorable to France. Philip's reign was disturbed also by insurrections in Catalonia and Andalusia. Philip IV was a generous patron of art and letters, as witness his relations with Velazquez, Lope de Vega, and Calderón. There is credible evidence that he was not without literary talent himself. Consult Francisco Silvela's introduction to his edition of the *Cartas de Sra. María de Agreda y del rey Felipe IV* (Madrid, 1885-86), and Antonio Cánovas del Castillo, *Estudios del reinado de Felipe IV* (ib., 1889).

PHILIP V (1683-1746). King of Spain from 1700 to 1746, first of the Spanish Bourbon dynasty. He was directly descended on both sides from Philip II, and was born at Versailles, Dec. 19, 1683, the son of the Dauphin Louis and Maria Anna of Bavaria, and grandson of Louis XIV and Maria Theresa, eldest sister of Charles II of Spain. The Archduke Charles of Austria, second son of the Emperor Leopold I, stood equally near the Spanish succession; but Charles II, dying without issue, left the Kingdom by his last will to Philip, then Duke of Anjou (1700). Philip was at once proclaimed at Fontainebleau and at Madrid as Philip V. To defend this succession, which threatened to disturb the religious political balance in Europe, France and Spain became involved in war with the Grand Alliance, formed by England, Holland, and Austria, and joined by Prussia, Denmark, Hanover, Portugal, and finally Savoy. (See SUCCESSION WARS.) The Peace of Utrecht (April 11, 1713) secured the throne of Spain to Philip, but shorn of the Italian possessions and the Netherlands. Philip V was distinguished "for few faults and few virtues," was weak-minded, and became almost imbecile before his death. His first wife, Marie Louise of Savoy, died in 1714, and with her death ended the influence the Countess Orsini had acquired over him, for Philip married Elizabeth Farnese of Parma, an energetic and ambitious woman. Her schemes for advancing the interests of her sons kept Spain embroiled throughout the reign. The minister Cardinal Alberoni (q.v.) directed his policy towards regaining the lost Spanish possessions in Italy, and had to be removed because of the hostility aroused among the Powers. In 1724 Philip abdicated in favor of his eldest son, Louis, but upon the death of the latter in the same year he resumed the crown, notwithstanding his increasing incapacity. In 1734-35 Don Carlos, son of Philip, wrested the Two Sicilies from Austria. In 1741 Spain entered into an alliance with France against Maria Theresa in the War of the Austrian Succession. (See SUCCESSION WARS.) Philip died at Madrid on July 9, 1746. He was succeeded by his second son, Ferdinand VI (q.v.). Consult:

William Coxe, *Memoirs of the Kings of Spain of the House of Bourbon from the Accession of Philip V to the Death of Charles III* (5 vols., London, 1815); a work that is still of value, although new sources have come to light since it was written; A. Baudrillart, *Philippe V et la cour de France, 1700-15* (2 vols., Paris, 1890); Alfred Morel-Fatio, *Recueil des instructions données aux ambassadeurs de France (Espagne)*, vols. i-iii (ib., 1894-99). See SPAIN.

PHILIP, GOSPEL OF. See APOCYPHA, *New Testament*.

PHILIP, JOHN WOODWARD (1840-1900). An American naval officer, born in New York City. He was appointed to the United States Naval Academy at the age of 16, became midshipman in 1861, and during the Civil War served in the Gulf blockading squadron, the James River fleet, and the South Atlantic blockading squadron, acting as executive of the *Chippewa*, *Pawnee*, and *Montauk* at the siege of Charleston. In July, 1862, he was promoted to be lieutenant and in July, 1866, to be lieutenant commander. After the war he was executive successively of the *Hartford* and the *Richmond*, was placed in command of the *Monocacy* in June, 1873, and in December, 1874, was commissioned commander. From 1874 to 1876, on leave of absence, he commanded one of the steamers of the Pacific Mail Steamship Company, running between San Francisco and Hongkong, and in 1877, again on a leave of absence, he commanded the Woodruff scientific expedition around the world. He was promoted to be captain in 1889, commanded the Boston Navy Yard from 1894 to 1897, and in the latter year was placed in command of the battleship *Texas*, which, still under his command, took a prominent part in the naval battle of Santiago during the Spanish-American War. In August, 1898, he was promoted to be commodore, was placed in command of the second squadron of the North Atlantic fleet, and in 1899 was made rear admiral. Consult Macley and Philip, *Life and Adventures of Jack Philip, Rear-Admiral U. S. N.* (New York, 1904).

PHILIP, KING (c.1630-76). A famous Indian chief, son of Massasoit; called King Philip by the English, though his Indian name was Metacombt. He became sachem of the Wampanoags, who were settled in the Rhode Island country in 1662, and in the same year went to Plymouth, promising to maintain friendly relations with the English colonists and not to cede any territory without their knowledge. About 1670 his attitude towards the English began to be suspected on account of frequent meetings of the tribes and many murders of white settlers; one of his own Indians, too, had accused him in 1667 of attempting to betray the English to the Dutch or the French. In view of these suspicions Philip and the principal tribesmen were summoned to meet the whites and explain their movements. This they did, and also agreed to surrender their arms; but it was only a truce, and preparations for war were still secretly carried on by the Indians. An Indian convert named Sausamon revealed to the colonists the preparations made by Philip, and he was murdered by the Indians. In revenge for the execution of his murderers by the whites, the Indians killed eight or nine colonists, and open hostilities were begun in June, 1675. The Indians did not venture to meet the colonists in battle, but burned or attacked a number of their

settlements, including Swansea, Brookfield, Deerfield, and Hadley, and laid ambushes for the settlers. In December, 1675, Gov. Josiah Winslow led a force of 1000 men against the Narragansets, with whom Philip had formed an alliance, took by storm a fort said to have contained 4000 Indians, near the present location of Kingston, R. I., destroyed their village of 500 wigwams, and put to death 500 of their warriors and twice as many Indian women and children. The war went on for the first six months of 1676, and was marked by burnings and massacres at Weymouth, Groton, Medfield, and Lancaster, Mass., and at Warwick and Providence, R. I. But the increased efforts of the colonists soon struck demoralization into the ranks of the Indians. A substantial reward was offered by the government for every Indian killed in battle, and many Indian women and children were captured and sold into slavery. A force under the command of the great Indian fighter Capt. Benjamin Church (q.v.) hunted Philip from place to place, at last finding him through the aid of a friendly Indian in a swamp near Mount Hope, where he was killed by another Indian while trying to escape. His body was quartered, on a Thanksgiving Day especially appointed, and his head was sent to Plymouth, where it was long kept on a gibbet. During this war about 600 colonists were killed, 600 buildings burned, and 13 towns destroyed, but of the two once powerful Indian tribes it is said that fewer than 200 individuals were left. PHILIP, THE ADVENTURES OF. A novel by Thackeray (1862). This sequel to *The Shabby Genteel Story* appeared in the *Cornhill Magazine* (1861-62).

PHILIP NERI, SAINT (1515-95). The founder of the Congregation of the Oratory (q.v.). He was born at Florence of a distinguished family, July 21, 1515. On the loss of his father's property he was sent to a wealthy uncle, who was ready to make him his heir, and with whom he lived for a time at San Germano, near Monte Cassino; but he relinquished these prospects to devote himself to the service of God, and on the advice of the Benedictine monks of Monte Cassino went to Rome to pursue his theological and philosophical studies (1533-37). He devoted himself to works of mercy, once sold his books to feed the poor, and in 1548, in conjunction with his confessor, Persiano Rosa, founded the Confraternity of the Holy Trinity to care for the needs of the vast numbers of pilgrims who visited Rome. This brotherhood is said to have provided hospitality for no fewer than 600,000 pilgrims in the jubilee year of 1625 and for a quarter of a million in 1825. Having long declined holy orders from motives of humility, he finally received them in 1551 and began as a priest a still more remarkable career of devotion and influence. Inspired by the tidings of the heroic labors and death of St. Francis Xavier, he determined to go to the Indies and assembled 20 companions; but he was finally convinced that Rome was meant to be the field of his work. The objects of the informal association out of which

the Congregation of the Oratory later developed were the instruction and training of the young and uneducated. As a means of withdrawing them from dangerous amusements, sacred musical entertainments were held in the oratory (hence called by the name of oratorio), at first consisting merely of hymns set to popular tunes, but afterward partaking more of the nature of sacred dramas. The music was composed by the first musicians of Rome. Palestrina was a spiritual child of Philip's, and died in his arms. It was in the lectures originally prepared for use in the oratory that, at St. Philip's instance, the gigantic Church history of Baronius had its beginning. The personal character of Philip, the unselfish devotion of his life, his unaffected piety, genuine love of the poor, kindly and cheerful disposition, and perhaps as much as anything else a certain quaint humor which pervaded many of his sayings and doings, contributed to popularize his work. The development of the Oratory was almost unconscious. In 1564 Philip was requested by his fellow countrymen the Florentines in Rome to take charge of their church of San Giovanni near the Ponte Sant' Angelo; he declined, until Pope Pius IV gave him permission to hold it while still retaining his residence in his humble cell at San Girolamo. In 1574 the Florentines erected a new oratory near the church, and the exercises were held there for a time; the following year he saw himself compelled to provide for the permanence of his work on a larger scale, and, taking the small church of Santa Maria in Vallicella, he pulled it down and built a large new one. Here he was authorized by Gregory XIII to found a definitely organized congregation in the same year. He still remained at San Girolamo and refused to appear as the head and founder of the new society, until in 1583 he was expressly commanded by the Pope to take up his residence in the new house. Then his associates elected him superior for life, despite all his protests. Ten years later, however, he prevailed upon them to let him lay the burden aside, and Baronius was chosen in his stead. He died May 26, 1595. Paul V beatified him in 1615 and Gregory XV canonized him in 1622. Called the Apostle of Rome, he remains to this day emphatically the popular saint of the Roman people, who observe his feast day with great devotion. From 1726 until the Italian occupation the popes were accustomed to go in solemn state on this day to visit his tomb and to say mass there.

Bibliography. The contemporary lives are by A. Gallonio, G. Barnabei, and P. G. Bacci, the first two contained in the *Acta Sanctorum*; English translation of the last by F. W. Faber (London, 1847; also a new rev. ed. by F. I. Antrobus, 2 vols., St. Louis, 1903); a modern biography by Cardinal Capececiatro (Naples, 1879; Eng. trans., 2d ed., London, 1894); also a *Life* by Mrs. Hope (ib., 1859); by Comtesse D'Estienne d'Orves (Paris, 1900); by A. von Pechmann (Freiburg, 1900); F. W. Faber, *Spirit and Genius of St. Philip Neri* (London, 1850); Cardinal Wiseman, *Panegyric of St. Philip Neri* (ib., 1856); *Maxims and Counsels of St. Philip Neri* (Dublin, 1890).

PHILIP OF SWABIA (c.1177-1208). An emperor of the Holy Roman Empire. He was the youngest son of Frederick Barbarossa and Beatrice of Burgundy. He was educated for the Church and in 1191 became Bishop of Würz-

burg. In 1192 he resigned his see. His brother, the Emperor Henry VI, gave him Tuscany in 1195 and in 1196 he succeeded to the Duchy of Swabia. In 1197 he married the Byzantine Princess Irene. On the death of Henry VI, in 1197, Philip endeavored to secure the Imperial crown for his brother's infant son, Frederick (II), but the German princes were unwilling to place the child on the throne, and Philip himself was chosen Emperor in 1198. But the Guelphs, under the leadership of Adolf, Archbishop of Cologne, put forward as a candidate Otho of Brunswick, who was crowned two months before Philip (1198) and in 1201 gained the support of Pope Innocent III. Philip fought bravely against great odds, and by bribes won over the Archbishop of Cologne and Hermann of Thuringia, with other powerful princes. In 1205 he was again crowned by the Archbishop of Cologne in Aix-la-Chapelle and later captured Cologne, but let his rival slip through his fingers. He finally made terms with Otho and with Innocent III. The former broke his promises, and Philip, making ready to attack him, was assassinated by Otho of Wittelsbach. Consult: E. A. Winkelmann, *Philipp von Schwaben und Otto IV. von Braunschweig* (2 vols., Leipzig, 1873-78); Wilhelm von Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. v (ib., 1888); Achille Luchaire, *Innocent III: la papauté et l'empire* (Paris, 1906).

PHILIPP, ISIDOR (1863-). A French pianist of Austrian birth. He was born at Pest, but early removed to France. In 1879 he entered the Conservatory as a pupil of Mathias and later studied under other famous teachers of that institution. He was intimately connected with the musical life of Paris and did much to spread a love for classical chamber music. Together with Loeb and Berthelier, he organized a series of concerts largely devoted to the presentation of new French compositions. He was also cofounder and subsequent president of the Société d'Art. In 1903 he received the appointment of professor of piano at the Conservatory. His studies for piano are of permanent value.

PHILIPPA OF HAINAULT, fi-lip'pà ov A'nò' (c.1314-69). An English queen, wife of Edward III and daughter of William the Good, of Holland and Hainault. She was married in 1328 to her cousin, Edward of England, by papal dispensation and brought him valuable continental allies during the war with France. It is said that she summoned the forces which defeated the Scottish troops at Neville's Cross (q.v.) in 1346. Philippa was mother of Edward, the Black Prince. She was a patron of Froissart and was very popular among the English common people. Queen Philippa is notable because she aided in maintaining and strengthening that close connection of England and Flanders which was so important for English commerce. Queen's College (q.v.), Oxford, was named in her honor. Consult: William Longman, *Life and Times of Edward III* (2 vols., London, 1869); T. F. Tout, *History of England, 1216-1377* (ib., 1905); K. H. Vickers, *England in the Later Middle Ages* (New York, 1914).

PHILIPPE DE THAUN. See THAUN.

PHILIPPEVILLE, fê-lép'vel'. A fortified seaport and the capital of an arrondissement in the Department of Constantine, Algeria, 38 miles north-northeast of the city of Constantine, on the Gulf of Stora, between Cape Boujaroun

and Cape de Fer (Map: Africa, E 1). Laid out in 1838 by Marshal Valée, on the ruins of the ancient Russicada, it is one of the prettiest towns in Algeria, and thoroughly French in its character. Philippeville is the chief railway station for the Department of Constantine and is connected by steamer with Marseilles and Algiers. It has several public offices, a large hospital and dispensary, Roman Catholic and Protestant churches, a commercial college, secondary schools, a public library and museum, theatre, etc. It has a distillery, tanneries, and cork manufactures. In the vicinity at Filfila are iron mines and quarries of marble. The town is an important entrepôt of the commerce of eastern Algeria and the Sahara, and the country in the vicinity is picturesque and fertile, producing grain, tobacco, cotton, and fruits. Its fine outer and inner harbors of 125 acres are protected by two breakwaters. The total annual value of its imports and exports is \$21,000,000. Pop., 1901, 21,251; 1911, 27,137.

PHILIPPI, fi-lip'pi (Lat., from Gk. Φιλίπποι). A city in northeastern Macedonia (Map: Greece, F 3). It was named after Philip II of Macedon (q.v.), who conquered it from Thrace (previously it had been called Crenides, the place of fountains) and enlarged it because of the gold mines in its neighborhood. It was situated on a high hill on the southern edge of a great plain and about 9 miles from the coast, where was the harbor Neapolis. With the rest of Macedonia it fell under the Roman power in 168 B.C., and was joined to the District of Amphipolis. In 42 B.C. it was the scene of the battles between Brutus and Cassius on the one side and Mark Antony and Octavian (Augustus) on the other, which resulted in the defeat of Brutus and Cassius. In consequence of this victory Augustus subsequently made Philippi a Roman colony and conferred on its inhabitants the *jus italicum*, which exempted them also from the land tax. Here about 50 A.D. the Apostle Paul founded a Christian church, to which is addressed the Epistle to the Philippians. An epistle to the same church is also preserved among the writings of Polycarp. The ruins, which include remains of an amphitheatre and of a great temple, are called, in Turkish, Felibedjik.

PHILIPPI, fê-lip'pê, FELIX (1851-). A German dramatist, born in Berlin. He entered journalism, traveled much, and after about 1884 devoted himself almost wholly to the writing of plays, empty and sensational, drawing their subjects from contemporary scandals, lawsuits, anything looming big in the public eye, but always showing a fine mastery of stage technic. Ultimately he became one of the most popular dramatists in Germany. His best-known plays are *Wer war's?* (1896); *Das Erbe* (1898); *Das grosse Licht* (1901); *Das dunkle Tor* (1902); and among later ones are: *Der Herzog von Rivoli* (1906); *Die Ernte* (1907); *Alt-Berlin* (1912); *Die Sieger Rom* (1913).

PHILIPPIANS, EPISTLE TO THE. One of the letters of the Apostle Paul contained in the New Testament. The Epistle was written to the Christian church at Philippi of Macedonia, which was founded by Paul on his second missionary journey (cf. Acts xvi. 12-40), about 50 A.D. The church had been visited by Paul at least twice after its founding, and besides this he had kept in close touch with it through messengers. From the first Paul's relations to

this church appear to have been exceptionally close and peaceful. It ever remembered him with gratitude and contributed once and again to his needs (iv. 10-20).

The Epistle was written from Rome towards the end of Paul's first imprisonment there. His case seemed likely at last to be about to be adjudicated and the Apostle was hopeful of being acquitted (i. 7, 12-26; ii. 24). Some time during Paul's imprisonment the Philippian church had sent one of their number, Epaphroditus, to Rome with a gift for their beloved Apostle. Epaphroditus had remained in Rome to assist Paul and had fallen ill with a sickness that came near to proving fatal, but fortunately had recovered (ii. 26 ff.) and was about to return to Philippi.

Such were the circumstances in connection with which Paul wrote to the church, sending the letter by Epaphroditus. The letter is primarily a personal message written in an open, confidential spirit, dealing chiefly with matters of personal significance and only incidentally touching upon points of doctrine.

After the usual epistolary signature, address, and greeting (i. 1-2) we have (1) a somewhat extended thanksgiving and prayer (i. 3-11). Then (2) the Apostle passes to information (i. 12-26) regarding evangelistic work in Rome and also as to his own circumstances. This is followed (3) by exhortation (i. 27-ii. 18) to steadfast consistency (i. 27-30), to imitation of the mind of Christ as seen in his wonderful humiliation (ii. 1-11), and to serious concern regarding their own salvation. He next passes (4) to information once more, this time concerning the plans of Timothy and Epaphroditus (ii. 19-30), following this (5) by a solemn and earnest warning against false teachings (iii. 1-iv. 1). This is followed (6) by concluding exhortations, both personal and general (iv. 2-9), with grateful acknowledgment (7) of their generous remembrance of him (iv. 10-19). The Epistle closes with the usual doxology, salutation, and benediction (iv. 20-23).

This brief review of the contents of the Epistle reveals its very practical character. Even the famous Christological passage (ii. 1-11) is pervaded by a practical rather than dogmatic spirit, and was probably never intended by Paul as a formal dogmatic statement.

Critical doubts as to the genuineness of the Epistle to the Philippians are of so arbitrary and superficial a nature as to be hardly worthy of serious discussion. The attestation of the Epistle as Paul's is both early and abundant, and the internal evidence of the Epistle itself is of such a character as to satisfy every reasonable demand. This is the opinion of an overwhelming majority of scholars. There is not so much unity of opinion as to the time and place of composition, a respectable minority holding to the theory that Paul wrote the letter during his imprisonment at Cæsarea before his voyage to Rome; but this theory rests on no certain foundation and is losing favor.

Bibliography. The New Testament introductions, such as those of Weiss, Beyschlag, Holtzman, and especially Theodor Zahn (Eng. trans., Edinburgh, 1909) and James Moffatt (New York, 1911). Of commentaries, that by J. B. Lightfoot (London, 1894) is the most thorough. More recent discussions will be found in G. C. Martin, in the New Century Bible (New York, 1902); R. D. Shaw, *The Pauline Epistles* (ib.,

1903); *The Expositor's Greek Testament* (ib., 1903); W. G. Jordan, *The Philippian Gospel* (ib., 1904); J. H. Jowett, *The High Calling* (ib., 1909).

PHILIPPICS. See CICERO; DEMOSTHENES.

PHILIPPINE (fil'i-plin, -pën, or -pîn) **ISLANDS.** An archipelago forming the most northern group of islands in the Malayan or Eastern Archipelago. It lies wholly within the tropics. The land surface extends between lat. 21° 10' and 4° 40' N., 1150 statute miles; the east and west limits are long. 116° 40' and 126° 34' E., making about 650 miles. The most northern land in the Philippines is Y'Ami Island, of the Batanes group, 93 miles south of Formosa; the most southern is Balut Island, of the Sarangani Islands, about 20 miles south of Mindanao; the most western is Balabac Island, about 40 miles north of Borneo; and the most eastern is Sancô Point, on the east coast of Mindanao. The archipelago is bounded on the west by the South China Sea, on the east by the Pacific Ocean, and on the south by the Sea of Celebes and the coastal waters of Borneo.

The archipelago numbers 3141 islands, of which 1668 are listed by name and 1473 are not named; 2775 of the islands contain less than 1 square mile. The coast line is for the most part so intricate that with one twenty-fifth the area of the United States it has more than double its coast line. Luzon and Mindanao are classed among the larger islands of the world, and nine others, Samar, Panay, Negros, Palawan (Paragua), Mindoro, Leyte, Cebû, Masbate, and Bohol, are of primary geographical importance. The rest are mainly dependent islands or islets along the coast of the larger islands or subordinate archipelagoes like the Sulu Islands. The area of the total land surface including the Sulu Islands is estimated at about 115,026 square miles, or a little less than the New England States, New York, and New Jersey together. Luzon (40,969 square miles) and Mindanao (36,292 square miles) comprise about seven-tenths of the total land surface, the area of the other leading islands being: Samar, 5031 square miles; Negros, 4881; Panay, 4611; Palawan, 4027; Mindoro, 3851; Leyte, 2722; Cebû, 1762; Bohol, 1441; and Masbate, 1236. The total water surface within the limits occupied by the archipelago is 705,115 square miles.

Topography. The Philippine Islands rise from a submarine platform less than 100 fathoms below the sea level, which is a north-eastern arm of a more extended plateau lying between Siam, Sumatra, Java, and Borneo. The platform surrounds the Sulu Sea, which descends to oceanic depths and is connected with the Borneic platform by the Palawan and the Sulu banks. Wallace's line, based on the biological features and separating Asiatic from Australian forms, lies close to the east of the islands. The submarine ridges are extended throughout the archipelago in the form of mountain ranges, from south to north, and form a large part of its relief. From the south coast of Mindanao to the north of Luzon the mountains are disposed in a line with or parallel to the trend of the platforms. The topography of the islands of the second class is simple. Each is traversed by a mountain range down its length, such as Leyte, Cebû, Negros, and Palawan, while on Panay the range closely borders the coast and Samar and Bohol are made up of hills with lit-

the appearance of system. The two great islands, Luzon and Mindanao, present greater variety of surface, with broad plains and level valleys, although in general there is comparatively little level land. The east coast of the former is bordered for 350 miles by a high, continuous mountain range, the Sierra Madre, from the northeast point nearly to the latitude of Manila. This range is seldom less than 3500 feet high, and occasionally peaks rise to 4500 feet. West of this is the great and fertile valley of Cagayan River, where is grown most of the tobacco of the archipelago. Between this valley and the coast of the China Sea are the Caraballos occidentales, a very complex range, culminating in Mount Dana, 7364 feet. Farther south a great plain or valley stretches from Lingayen Gulf to Manila Bay, bordered on the west by the Zambales Range, 4000 to 5000 feet high. The southern part of the island is broken by numerous short ranges and volcanic peaks. The Pacific coast of Mindanao is bordered by a high and continuous range, west of which is the valley of Agusan River, 40 to 50 miles wide. Then succeed several ranges, on one of which stands the extinct volcano, Apo, 10,312 feet, the highest point in the archipelago, beyond which to the westward is the valley of the Rio Grande de Cotobato, the lower valley of which is very broad and fertile.

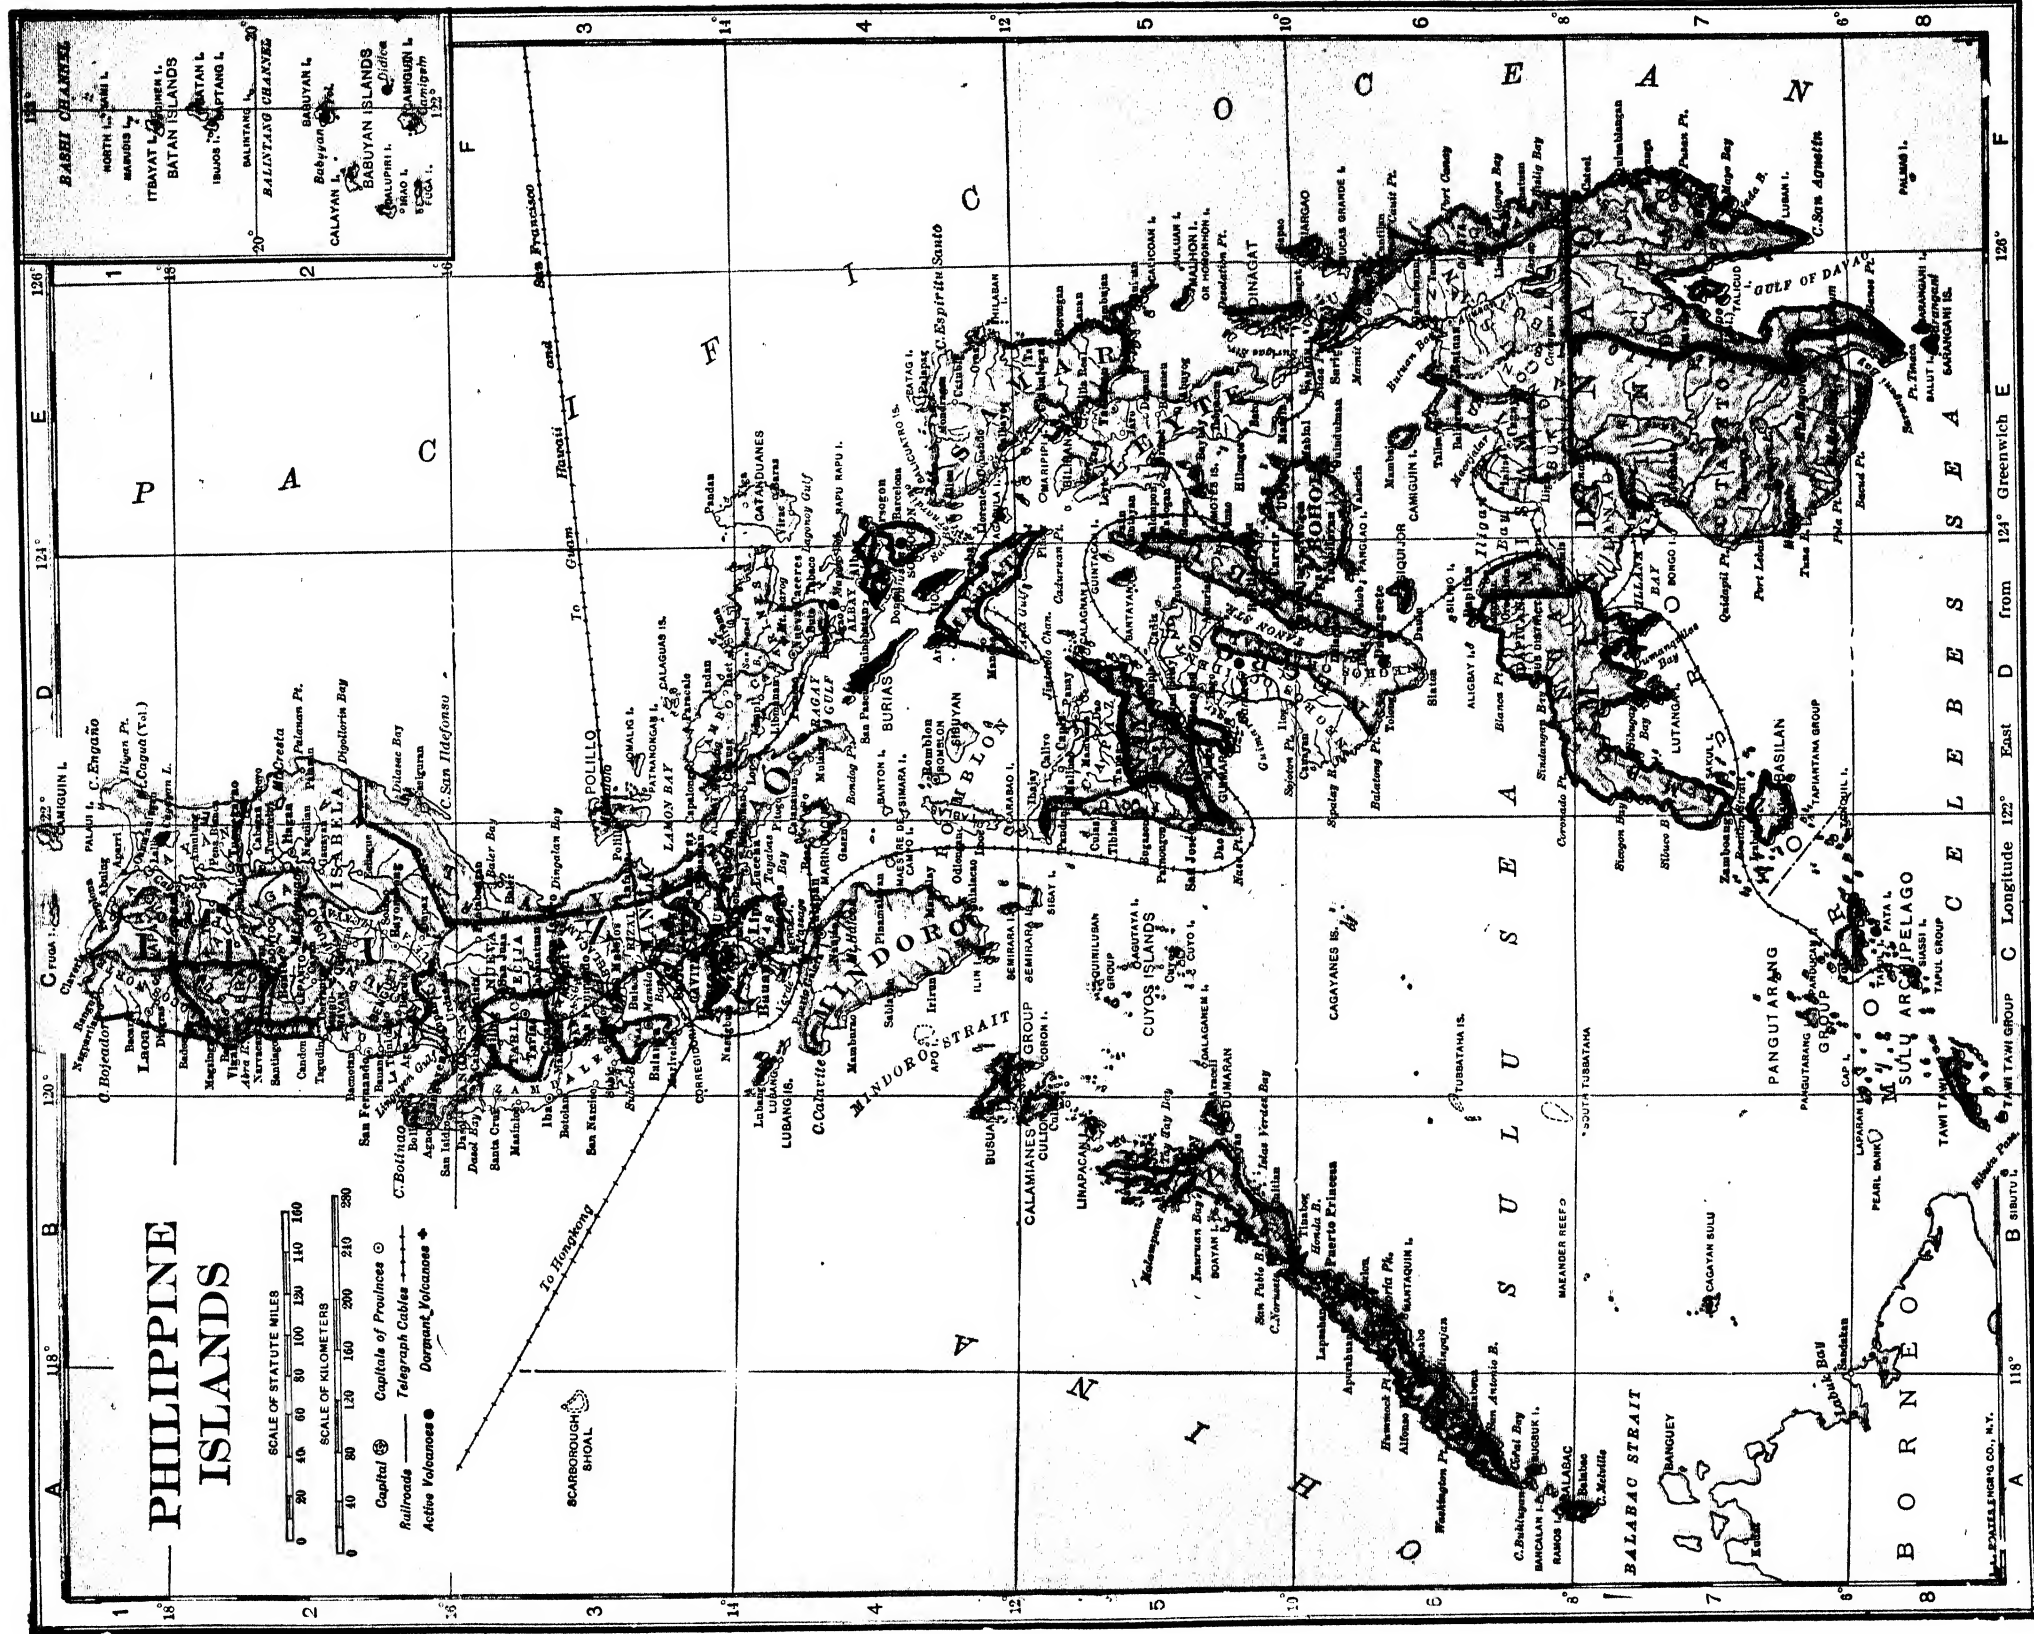

Hydrography. In the smaller and narrower islands the mountain chain which is the backbone of each island is the great central water parting, streams flowing to the sea on either side of it in short, straight courses. The drainage of the larger islands is more complicated, the parallel arrangement of the mountain chains giving space for the development of considerable streams. Among them is the Rio Grande de Cagayan (q.v.), Luzon, with a drainage basin of 10,000 square miles, or one-fourth of Luzon. This river is the largest on the archipelago, being some 220 miles long. All the interior waters of northeast Luzon are tributary to the Cagayan, reaching the China Sea on the north coast of the island. Most of the interior waters of central Luzon, south of the Cagayan basin, are included in the systems of the Agno and the Pampanga, which empties through a wide delta into Manila Bay, and of Laguna de Bay and the Pasig River. The mountains are so near the sea in east Luzon that the rivers of that coast are of small importance, excepting the Bicol in the southeast, which floats small vessels; but in the northwest the Agno has 11 feet of water on its bar at high tide, which gives some importance to the port of Dagupan at its mouth. The Pasig is only 12 miles long, but, as it connects Laguna de Bay (q.v.) with Manila Bay through the chief port of the island, it is a commercial highway of importance. The river systems of Mindanao, confined to a considerable extent within the parallel ranges, have chiefly a north and south direction and are more important for navigation than those of Luzon. The Rio Grande de Cotobato, one of the largest rivers in the Philippines, drains the central basin of the island, carries the waters of many tributaries to the Celebes Sea on the west coast, and is navigable for gunboats as far as Lake Liguasan. The Rio Agusan (q.v.) rises about 25 miles from the south coast and reaches the sea on the north coast, nearly dividing the island. It is navigable for a few miles from its mouth. The most important lakes in Luzon are Laguna de

Bay, 25 miles long and 21 miles wide, which receives numerous small streams from the mountains around it, and Bombon or Taal, 14 by 11 miles in extent, Taal volcano rising amid its waters. The largest lakes of Mindanao are the system of Buluan-Liguasan, in the centre, and Lanao, near the north coast. Smaller lakes are scattered over the islands.

Climate. As the archipelago is wholly within the tropics, the climate is warm. Its insular situation, its proximity to the great continent of Asia, its low latitude, and its topography explain its peculiarities of climate. From November to June the northeast trade wind prevails, and consequently the east coasts have a heavy rainfall, while most of the rest of the archipelago, being protected by the east-coast ranges, is comparatively dry. During the remaining four months the southwest monsoon prevails, producing a rainy season over most of the archipelago, while the east coasts are comparatively dry. The average annual rainfall of Manila, covering a period of 32 years, is 75.43 inches. At Manila, which in temperature fairly represents the archipelago, the cool season (November, December, January, and February) has a mean monthly temperature ranging from 75° F. to 80° F.; in the warm season (March, April, May, and June) the mean monthly temperature ranges from 81° F. to 84° F., and in the wet season (the four remaining months), 79° F. to 81° F. The highest temperature recorded at Manila, and recorded but once in recent years, is 100° F. in May, and the lowest 60° F. in January, an extreme record range of only 40° F. The range of temperature through the day is slight. The relative humidity is not high except in the wet season, when it approaches saturation all the time. The rivers often overflow their banks during the wet season, and wide areas in the larger islands are submerged, but the floods are not feared so much as the cyclonic storms of wind and rain known as typhoons, which seldom occur south of lat. 9° N., but north of that line sometimes destroy the lives of thousands of persons and wreck many vessels and villages. The typhoons, which are similar to the hurricanes which devastate the Atlantic coast of the United States, are most frequent in July, August, September, and October, when these whirling winds from the Pacific occasionally sweep the whole archipelago north of Mindanao. The most terrific of these storms recorded in the Philippines struck Manila in 1882, traveling at a velocity of 140 miles an hour.

Flora. The vegetable life is rich and varied, with very few distinctive species, but some plants that are transitional between the flora of Formosa on the north and Borneo on the south. A great variety of tree life is found on the islands; the Philippine Forestry Bureau reports 747 species of wood brought to market, and the number of useful woods is undoubtedly much larger. It is estimated that 80,000 square miles, or 70 per cent, of the archipelago is forest-covered. Woods suitable for the finest cabinet-work, for veneering, and for artistic purposes are abundant. Gutta-percha and India-rubber trees abound. Many trees are so hard that they cannot be cut by the ordinary circular saw. The bamboo grows in numerous varieties and, as in other parts of the Malayan Archipelago, is indispensable to the natives. The cocoa palm flourishes everywhere, and many of the ripe nuts

SCARBOROUGH
SHOAL

are collected in rafts and floated to market. The oil is used in cooking and as an illuminant. Other palms are very numerous. The banyan is common and grows to enormous dimensions, and the cinnamon, clove, and pepper are found wild in the southern islands. About 1200 genera and 5000 species of plants have thus far been recognized by botanists. Economically the most valuable of the wild plants is Manila hemp, the fibre of a wild plantain (*Musa textilis*). The plant closely resembles the edible banana in appearance and grows best on shaded hillsides at moderate elevations. The crop is raised on plantations, which yield, when carefully managed, an annual return of 30 per cent on the capital invested, but notwithstanding the large area devoted to the cultivation much of the exported product is gathered wild. This condition, however, is rapidly changing. This fibre is not successfully raised elsewhere except on a few plantations in North Borneo. Practically all the cultivated plants of the South Asian island world are successfully raised, including rice, sugar, tobacco, coffee, cacao, maize, and sweet potatoes.

Fauna. The islands are poor in indigenous mammals; altogether there are but 23 species of mammals on the islands. The most important animal is the carabao or water buffalo, which is caught young, tamed, and universally employed as a draft animal, while his tough flesh is valued by the natives as meat. He is usually docile, but is slow and lazy and during the heat of the day will not work more than two hours at a time without his mud bath. The female gives abundant milk, from which ghee, a kind of butter, is made. The hide makes valuable leather. The timarau, a small buffalo living in the jungles of Mindoro, has never been tamed; it often attacks and kills the larger carabao. A small humped variety of cattle are raised in large numbers for beef on some of the islands. Goats are common and are utilized both for milk and flesh. There are several species of deer, and both wild and domesticated hogs are very abundant. The larger horse, as known in America and Europe, does not thrive, but the Philippine pony, originally from Spain, is an excellent saddle horse and useful in teams as a carriage horse, but not strong enough for heavy work. The carnivora have no large representatives, and only a small wild cat, two species of civet cats, and the binturong are conspicuous. The islands have nearly 600 species of birds, among which are the jungle fowl, hornbill, fruit pigeon, the snipe, curlew, and other waders, also the species of swift whose nests (edible birds' nests) are highly esteemed in China as an article of food. Marine fish are far more important than fresh-water fish and form the largest part of animal food, the natives also eating many varieties of shell fish. The pearl oyster, yielding a considerable quantity of shell and jewels, is fished in the Sulu Archipelago. Crocodiles and snakes are abundant. Swarms of locusts sometimes devastate the fields, and rice and tobacco have other insect enemies.

Geology. The geology of the archipelago has not yet been systematically studied. In broad outline the islands appear to consist of ancient eruptive rocks that have been covered by volcanic outpourings of the Tertiary, Quaternary, and present epochs, and in the lower levels by alluvium. There are 12 volcanoes which have

been in eruption within historic times. The most famous among them, and perhaps the most beautiful volcanic cone in the world, is Mayón, near the Bay of Legaspi, in southeastern Luzon. Mayón is 7916 feet in height, and some of its eruptions in the past three centuries have been very serious. The surrounding country has been well-nigh buried under its streams of lava, and its clouds of volcanic dust have been carried through the air as far as the coast of China. Another remarkable volcano is Taal, which is an island in the middle of Lake Bombon, Luzon, with an area of 220 square miles, built up from the bottom of the lake by the outpouring from several craters. In January, 1911, this volcano exploded, attended by a remarkable electrical display visible for 250 miles. Over 1300 people are known to have been lost, and mud and ash were over an area some 1200 square miles in extent. The archipelago is a centre of seismic as well as volcanic energy, and the volcanic centres are often the sources of the severest earthquakes. Most of the very violent shocks from which Manila has suffered, e.g., have radiated from the Taal centre. Other regions subject to earthquakes lie about Mayón, on the island of Masbate, and along the north shore of Luzon. For the 18 years 1880-97 there was an average of 53.4 earthquake days in the year, or 4.5 per month, while 796 earthquakes were recorded between 1902 and 1908.

Mineral Resources. The mineral resources of the islands are diversified, but so far little developed. Already 113 mineral species and varieties have been classified, and coal and gold are found in almost every island of the archipelago. The latter mineral has for years been obtained in small quantities by Filipinos, but because of primitive methods and equipment only shallow alluvial and free-milling surface ores have been accessible. Spanish explorers were quick to discover and take advantage of this resource in the Philippines, but the best Spanish records indicate that mining was carried on with more energy before the Spanish Conquest than it was afterward. Early in the seventeenth century the production from one district near Paracale-Camarines was about \$200,000 per year.

The principal gold-mining districts are the Baguio and Lepanto regions, in the Mountain Province, the Aroroy district, Masbate, the Paracale district, Camarines, and the Cansuran district and Mindanao. The first two districts are the lode, and the last two the placer, gold districts. The total gold production has advanced from less than \$170,000 in 1907 to \$1,125,000 in 1914.

The quality of coal ranges from black lignite to semianthracite. Conservative examination shows that there are "in sight" at least 35,000 tons of lignite and 1,000,000 of subbituminous coal. The production of coal has declined since 1909, when 36,336 metric tons were produced. In 1913 there was no commercial production; the only activity in coal mining was on the island of Cebu. Coking coal occurs in Cebu and Bulacan provinces, but it has not proved economically important.

Silver is found alloyed with gold in practically all of the gold deposits, in the ratio of one part of silver to four parts gold. There are high-grade copper deposits in Benguet, Pangasinan, Batangas, Mindoro, Masbate, Panay, and Mindanao. Valuable deposits of high-grade hematite and magnetite are found in the eastern and south-

eastern cordilleras of Luzon. These deposits are undeveloped, but the ore occurring as boulders on the surface of the ground in Bulacan and Rizal provinces amounts to 5,000,000 tons. The iron produced by natives amounts to about 140,000 metric tons annually. Other minerals and metals which occur in the islands are Portland cement, lime abrasives, asbestos, gypsum, petroleum, salt, stone, sulphur, sand, and gravel. The total value of the mineral products in 1913 was 3,944,581 pesos.

Agriculture. It is estimated that less than half the agricultural lands are in cultivation, and the development of this area has been restricted by lack of knowledge of proper agricultural methods. The American government since its occupation has made systematic efforts to improve these conditions. There are six government agencies giving instruction in agriculture or engaged in agricultural development.

The most important strictly agricultural product is sugar; in 1913 there were 435,200 acres of land under cultivation in sugar cane, representing about one-half of the land suitable for this crop. In some localities the massive granite rolls imported from China are still used. In 1854 the sugar exportation from the Philippines exceeded 47,000 tons and constituted 33 per cent of the total exportation. From this time until 1890 the industry gradually increased in importance until the average annual exportation for the four following years amounted to 200,000 tons, valued at \$7,500,000. A demand for a better grade of crude sugar resulted in the introduction of improved measures and methods for the making of centrifugal sugar. The first factory for the output of this sugar was built in 1907. The exportation of sugar in 1914 amounted to 236,498,001 kilos, valued at \$11,059,593. Approximately 75 per cent of this sugar, representing the better grades, was shipped to the United States and the remainder to China and Japan.

The growing of coconuts and the production of copra and coconut oils are agricultural industries of great importance. The Philippines export more copra than any other country. There are on the islands 45,000,000 coconut palms. These are widely distributed, but the majority are south of the city of Manila. All the coconut not intended for direct consumption as food is made into copra, which is coconut meat partly dried, or into oil. Copra is made at an extremely low cost of operation, the development of this industry is comparatively recent. There were exported, in 1914, 87,344,000 kilos, valued at about \$8,000,000. It is estimated that not less than 150,000,000 nuts are consumed annually for food in the islands.

Abaca (Manila hemp) is not only the most important fibre, but also the most important export product of the Philippines. For a number of years it comprised approximately two-thirds of the total export trade of the islands. The principal production for export did not commence until 1888, when 41 tons were exported. Abaca is distributed throughout the greater part of the Philippine Archipelago. During the fiscal year ending June, 1913, the total area cultivated was 909,849 acres. This production was distributed among Albay, Ambos, Camarines, Sorsogon, Leyte. Until recently in the production of abaca the old and crude methods of fibre extraction were used. Since 1903 several large plantations have been established in different

localities, and improved methods in the cultivation of the plant and in the general management have been adopted. There were exported, in 1914, 116,886,575 kilos of hemp, valued at \$19,104,815.

Rice is the staple food of the Philippines and is grown in every province. The prevailing system is single cropping, with little or no attempt to restore the fertility of the soil. In most sections but one crop is produced annually, but in a few restricted areas favored with a more distributed rainfall and by the aid of irrigation two crops per annum are grown. Prior to the eighties there were several annual crops of rice, so that it entered into the list of exportations. Since that time importations have been necessary to meet the home demand. The development of the sugar and hemp industries and the demand for labor for railway building and public works have encroached upon the labor supply available for rice production. Another important factor is the lack of work animals.

The growing of tobacco is one of the oldest industries of the Philippines, and Manila cigars are perhaps more widely known than any other production of the islands. The growing of tobacco did not assume the proportions of an industry until 1781, when Governor-General Vasco decreed that the government should have control of the production, manufacture, and sale of this product. By this decree a monopoly was created which remained in operation for 100 years. The monopoly strictly supervised the growing and grading of the leaf and had factories in Manila for the manufacture of cigars, cigarettes, and smoking tobacco. Through the strict enforcement of regulations, especially in the earlier period of its operation, the monopoly secured for the tobacco an enviable reputation for quality. Dissatisfaction in its management finally resulted in the dissolution of the organization. The tobacco monopoly throughout its entire period was the chief source of income for the government. While tobacco is grown in almost every province, the greatest areas devoted to the industries are in Isabela, Cagayan, Pangasinan, Cebu, and La Union, which contain 78 per cent of the total area planted with tobacco and produce about 84 per cent of the crop. There were exported, in 1914, 13,085,442 kilos of manufactured tobacco, valued at \$1,757,824. Cigars exported in the same year numbered 154,753,363, valued at \$2,315,723. It is estimated that 4,500,000,000 cigarettes are consumed in the islands annually. On these the consumers pay to the government approximately \$2,250,000 as internal-revenue tax.

Other agricultural products of greater or less importance are vegetable oils, tanning materials, cacao, and coffee. The latter product was formerly a prolific source of revenue for the people of Batangas and neighboring provinces, but the lack of information regarding the pests of this plant and the consequent neglect to protect it from insect and other diseases have caused it to be absolutely abandoned. Coffee grows most luxuriantly in Bontoc, Benguet, Ilocos Norte, and Agusan provinces; practically all is consumed in the islands.

Live Stock. The carabao is the most important domestic animal, and the Filipino hog is second in importance. The great need of the live-stock industry is better breeding and better care. There are large and important areas

in Mindanao and many other small areas well adapted to the raising of cattle, carabao, and ponies. The live-stock industry has suffered from rinderpest and other diseases. It is estimated that from 1910 to 1915 the total loss from rinderpest was 2,528,900 pesos. In 1902 the loss from rinderpest was between 50,000,000 and 60,000,000 pesos. Many of the provinces lost from 50 to 80 per cent of their carabao and cattle. The Bureau of Agriculture has suppressed the disease by quarantine and other measures for many years. It is probable that under present conditions the disease will not be entirely stamped out, since the lands in the islands are unfenced and animals cannot be easily quarantined, and because of prejudice on the part of the owners against the quarantine regulations. Immunization has been employed with success, and it is probable that this will prove the best solution of the problem.

No census of the live stock has been taken since 1903. In that year the neat cattle numbered 770,000, horses about 145,000, sheep about 30,000, goats about 125,000, swine about 1,180,000, and poultry about 5,565,000.

Forest Products. The virgin forests of the islands cover about 40,000 square miles, about one-third of the total area, approximately equal to the area of the State of Kentucky. In addition there are estimated to be 20,000 square miles of second-growth forest which will yield large quantities of lumber and firewood. More than 99 per cent of the timber belongs to the Philippine government and is under the administrative control of the Bureau of Forestry. About 70 per cent of all the timber belongs to the dipterocarp family. The largest of this family reaches 200 feet in height, and some specimens have a diameter of 7 feet. About a dozen botanically distinct species furnish about 80 per cent of the entire cut. This number can be reduced to three groups, the lauans, apitongs, and yacals. The main wealth of the Philippine forests lies in the first group. It may be divided into two classes, the white and red lauans. Export grades of the red lauans are used in Europe and America as substitutes for mahogany and are frequently sold as such. While not so hard and durable as mahogany, this timber has a beautiful grain and permits of a very fine polish. The public forests are not sold, but are developed under the license system. The small operators usually work under area license for definite small areas. Exclusive license or concessions are usually for a period of 20 years and permit the holder to cut and extract timber and other forest products in a special tract. Among the minor forest products are nipa palm, which produces sugar and alcohol, rattan, resins, gums and oils, gutta-percha and rubber. The various forms of bamboo found in the Philippine Islands are probably put to more uses than any other single product. In addition to the domestic and industrial uses it is found that one kind of bamboo, carabaho, is an excellent material for paper pulp—the cost of production being lower than that of wood pulp, while the product is excellent.

Commerce. Foreign commerce has increased steadily under American rule; this is shown by the fact that the total trade in 1905 amounted to \$63,505,324, which increased by 1912 to \$116,591,201. In 1914 it fell to \$97,278,287, because of the European War. Approximately 50 per cent of the trade supply of the islands

in 1914 was with the United States; the export trade supply amounted to more than 50 per cent and the import trade to less than 50 per cent. The value of the import trade in 1914 was \$48,588,653. The export trade reached a higher mark during 1914 than during any year since 1899 with the exception of 1912. The exportation of sugar showed an immense increase not only in quantity but in value. Table I below shows the chief articles of the imports for

TABLE I

NAME OF ARTICLE	1914	1913
Agricultural implements, and parts of	\$35,440	\$33,573
Carabao*	66,557	2,666

Fisheries. Next to the agricultural products food fishes are of the greatest importance to the Filipinos. In Manila alone fresh fish to the value of over 5000 pesos are sold each day. About 1800 species in the Philippine waters have been identified, and with a few exceptions they are all used as food. Such fish as the anchovy, sardine, and herring abound and constitute a potential source of wealth. Game fish are found; among them the jewfish, bonieta, swordfish, and tuna. In the vicinity of Manila and in other localities are many ponds, which in many cases serve the twofold purpose of growing the market fish and providing salt for manufacture. Pearl shells to the amount of 292,211 kilograms, valued at 354,264 pesos, were exported in 1913. The pearl industries are proving to be a profitable investment for Japanese capital. The gathering of button shells, window oysters, and trepang (*bêche de mer*) are also industries of considerable importance. A large amount of shark fins is exported yearly to China, where it is dried and used for food. Specimens of good quality are found in the Moro Province. Large oysters grow native to the islands.

Manufacturing. Except for cigar and cigarette manufactories, of which there are some of the largest in the world, manufacturing has been largely confined to household industries, to the making of articles for domestic consumption, such as native cloths, hats, shoes, mattings, baskets, etc. The Philippine government is encouraging these household industries, particularly those of weaving, hat and basket making, and embroidering. (For manufacture of sugar, tobacco, and coconut, see *Agriculture*, above.) In 1912 the first modern mill for the extraction of coconut oil appeared, and the exports of this commodity have increased from 660 kilos, valued at \$40, in that year to 11,943,329 kilos, valued at \$2,619,183, in 1914. The manufacture of,

distilled spirits from palm sap is another important industry, the produce reaching 11,276,298 proof liters in 1914. Practically the entire output is consumed locally, and more than half of it is denatured and used for industrial purposes. The output of the lumber mills has increased from 176,758 cubic meters in 1908 to nearly 300,000 cubic meters in 1914. Public forest lands in the Philippines are about 60,000 square miles in area, two-thirds of which are virgin forest and are estimated to contain about 200,000,000,000 board feet of merchantable timber. (See *Forest Production*, above.) As this supply lies only a few days' sail from China, a country practically denuded of forests, this industry is expected to grow rapidly. Other minor manufactures are those of pearl buttons, umbrellas, shoes, soap, cordage, and vehicles.

Transportation and Communication. The Philippines are connected with the outside world by two lines of cable, one American and one European. Manila is a regular port of call for freight and passenger vessels of several steamship lines, connecting with San Francisco and Seattle in the United States, with Japanese, Chinese, and other Far Eastern ports, and with Mediterranean ports in Europe. Sailings to and from Hongkong are regular and frequent. The principal ports of the islands are connected by steamship lines having terminals at Manila. There are in operation about 732 miles of railroad, of which about 600 miles are in Luzon, 70 miles in Panay, and 60 miles in Cebu. Additional construction is under way in Luzon. Manila has an urban and suburban electric-railway system, operating about 40 miles of line. The construction and maintenance of highways are directly under the control of the central government and are being carried out on a comprehensive plan by experts. Already more than 9400 miles of public roads have been built, of which about 3000 miles are first-class, 2000 second-class, and the rest third-class.

Interisland telegraph service is furnished by about 1000 miles of land and about 2000 miles of submarine line. Excepting one line of cable operated by a corporation, and the wireless stations and a few short lines operated by the army and navy, the public-telegraph service, land, submarine, and aerial, is maintained by the Philippine government in connection with its postal service. There are in the islands about 600 post offices, about one-half of which are telegraph, cable, or wireless stations. Telephone service in the city of Manila is furnished by a public-service corporation. Outside of that city, where not furnished by the postal service, the lines are owned and operated by the provincial governments. There are about 1200 miles of telephone wire furnishing service to about 6000 stations.

Finance and Banking. The Philippine government has been self-supporting since its establishment by the Americans. Its revenues, derived principally from customs-import duty and internal-revenue duty, amounted to \$16,391,572.66 in 1913. Expenditures for the same year amounted to \$14,444,161.94. The Philippine government has a bonded indebtedness of \$12,000,000, \$7,000,000 of which was borrowed for the purchase of agricultural lands formerly owned by ecclesiastical societies, and the remainder to carry on public works, particularly harbor and port improvements at Manila, Iloilo, and Cebu. In addition the insular government

has guaranteed sewer and water-works bonds of the cities of Manila and Cebu in amounts of \$4,000,000 and \$125,000 respectively. It has also guaranteed as to the payment of interest some \$15,500,000 of railroad-construction bonds secured by mortgage on the property of the roads. Ample sinking funds have been provided by law for the retirement of the bonds of the central government and of the cities referred to.

The currency system of the islands is on a gold basis, the unit being the peso, equivalent to 50 cents in United States currency. On June 30, 1914, there was in circulation P18,412,000 in silver and P28,188,000 in silver certificates; also P5,433,520 in notes of the Bank of the Philippine Islands, making a per capita circulation of about \$3.41. There are in the islands four banks which engage in a general banking business. Their combined capital amounts to \$2,250,000. The Bank of the Philippine Islands at Manila with branches at Iloilo and Zamboanga is a domestic bank and the only one authorized to issue and circulate notes. The other three, which are foreign institutions having houses at Manila, are the Hongkong and Shanghai Banking Corporation with a branch at Iloilo, the Chartered Bank of India, Australia, and China with branches at Cebu and Iloilo, and the International Banking Corporation with a branch at Cebu. In addition to these, a savings and loan institution called the Monte de Piedad and Savings Bank is operated in Manila by ecclesiastical authorities.

The Agricultural Bank and the postal-savings system are operated by the Philippine government. The Agricultural Bank was established in 1908 to relieve farmers from the high rates of interest charged by private lenders. Loans are made only to persons engaged in agricultural pursuits and not in excess of 60 per cent of the value of the land or crops given as security. The postal-savings system was established in 1906. On April 30, 1915, it had 50,944 accounts, with deposits of \$1,656,046.86 in all. Of the depositors 43,158 were Filipinos, 5618 were Americans, and 1236 Europeans.

Weights, Measures, and Money. The archipelago is on a gold basis. The money in use, besides American gold, silver, and paper, consists of Filipino pesos of a guaranteed value of 50 cents, and subsidiary coins, with paper representatives. The metric system of weights and measures is officially in use, but Spanish and Malay denominations are also employed.

Population. A census of the Philippines was taken in the spring of 1903 by the insular government. This showed a total population of 7,635,426, of which 6,987,686 were civilized and 647,740 were wild peoples. The average annual rate of increase for 50 years was 1.1 per cent. The density of population was 67 per square mile. The estimated population on June 30, 1914, was 8,650,937. Manila, the capital and largest city, had in 1914 a population of 266,943.

The table herewith gives the area, population, and population per square mile by provinces and by islands for 1903.

The civilized people were divided almost equally as to sex. As to birthplace, 6,931,548, or 99.2 per cent, were native born. There were 41,035 Chinese (or 0.6 per cent), 8135 Americans, 3888 Spaniards, 667 British, and 368 Germans. About half of the foreign born were in Manila.

The average age of the people was but 23.9 years, which is 2.4 years less than that of the people of the United States. Only 2.4 per cent of the population was less than one year of age—a small proportion due, not to a small birth rate, but to a high rate of infantile mortality. Children under 5 years formed 15.1 per cent and those under 10 years 28.8 of the population, which were average proportions. Children of school age, 5 to 17 years, were 30.6 per cent, a little more than in the United States.

BY PROVINCES	Area in sq. miles	Population	Population per sq. mile
Albay	1,783	240,326	135

As to conjugal conditions, 56.4 per cent were single, 33.1 were legally married, 8.3 were consensually married, and 7.2 were widowed. The proportion married, including the legal and consensual marriages, 36.4 per cent, was very large.

Of the population over 10 years of age, 55.5 per cent could not read and 79.8 could not write. The literates, i.e., those who could both read and write, were 20.2 per cent, or about one-fifth of the population over 10 years of age. The proportion of literates among males was much larger than among females.

The occupations of the Filipinos are few and simple in character. A very large proportion, 43.5 per cent of the inhabitants, are wage earners. The magnitude of this proportion is due to the large numbers of women workers. While

male workers were 57.6 per cent of all males, about the same as in the United States, the proportion of women workers was 23.4, as compared with 12.8 in the United States. Of the total number of wage earners, 41.3 per cent were engaged in agricultural pursuits, 0.8 in the professions, 18.8 in personal and domestic service, 7.5 in trade or transportation, and 31.6 in manufacturing or mechanical pursuits. From this it is seen that agriculture is far the most important of the Filipinos' occupations. The following table shows the proportion of all wage earners engaged in each of the principal occupations:

	Per cent
Farmers and farm laborers.....	40.7
Weavers and spinners.....	18.8
Day laborers.....	12.6
Merchants.....	4.5
Fishermen.....	3.8
Launderers.....	2.2
Seamstresses.....	2.2
Servants.....	1.8
Carpenters.....	1.3

Seven-eighths of all wage earners are accounted for in these nine occupations.

Education. To the problem of educating Filipinos of school age and older the American government has given most careful attention since the beginning of American occupation. Under the Spanish régime the provisions for elementary education, although excellent, were deficient in execution, and as a result little progress had been made in the education of the masses of people. Under American rule the Department of Public Instruction, with the director of education as the executive officer, is in direct charge of the educational methods. When schools were first started after the American occupation, the pupils presenting themselves for instruction were for the most part of the lower classes. In 1903 there were over 10,000 in intermediate and 6000 in secondary grades.

The total number of primary schools in 1914 was 3851. In these were enrolled 577,732 pupils. The average daily attendance was 392,094. There were 41 secondary and 309 intermediate schools. In the secondary schools were enrolled 6438 pupils, with an average daily attendance of 5546. In the intermediate schools there were 36,860 pupils, with an average daily attendance of 30,912. The total school population of the islands in 1912-13 was 1,256,046. In the schools for non-Christian pupils were enrolled 4680 male and 1130 female pupils. These schools numbered 129, and in them were employed 325 teachers.

At the beginning of the American occupation and for many years thereafter it was necessary to employ for the most part American teachers. The tendency has been to employ Filipino teachers as far as possible. There were 539 American teachers employed in 1914-15, while the Filipino teachers at the close of the year numbered 9300. Great advancement has been made in the average attendance and ability to teach among the native teachers.

Special efforts have been made in the direction of industrial education. The programme of industrial instruction, covering seven years of work, is four years of primary course and three years of intermediate courses. Instruction is provided in agriculture, domestic science, needlework in its finest forms, weaving of Philippine fibres, and work in wood, iron, and clay. In 1913, 736 teachers gave their entire time to industrial work, and in that year the average

school in the Philippines, except 37 schools offering secondary education, gave industrial work in one form or another. In that year 19,998 boys were taking trade and shop-work courses, 113,640 boys were engaged in farming and gardening, 12,996 girls were taking the gardening work, and 83,193 girls were studying household and housekeeping arts. There were, in 1914, 19 provincial trade schools, and in addition to these 280 intermediate-school shops, in which over 200 pupils took the regular trade courses and over 7000 pupils received some instruction in wood-working. Certain schools depend on the insular government for support. These are termed insular schools and include the Philippine Normal School, the Philippine School of Arts and Trade, the School of Household Industries, the Philippine School of Commerce, and the School for Deaf and Blind. The new Philippine Normal School building was completed at Manila in 1914. In this institution prospective teachers annually receive instruction along the lines of advanced academic work, basketry, hat making, fine needlework, lace making, and domestic science and economy. The Philippine School of Arts and Trade at Manila is the largest trade school and sends out each year a large number of skilled and experienced workmen. The Philippine School of Commerce offers a four years' course in business and clerical subjects. The School of Household Industries, established in 1912, trains women in certain selected home industries, particularly lace and embroidery. Upon returning to their home towns graduates establish centres for the production of high-grade needlework. The total expenditure for education for the fiscal year ending June 30, 1914, was 4,080,055 pesos. See PHILIPPINES, UNIVERSITY OF THE.

Health and Sanitation. Since the American occupation of the Philippines the improvement in health conditions and in sanitation has been one of the most serious problems. The result of the efforts that have been made is indicated by the fact that in 1913 there were 60,000 less deaths than in 1906. This reduction has occurred almost entirely among the preventable diseases. In spite of improved conditions there are annually more than 100,000 deaths from tuberculosis, malaria, beriberi, and intestinal diseases, all of which are preventable. It is estimated that malaria alone is responsible for at least 25,000 deaths annually.

Under the administrative jurisdiction of the Bureau of Health are the general and special government hospitals, the medical care of the civilian employees, and the operation of the food and drug acts. Prior to the American occupation nearly all the charitable work, even to the taking care of the lepers, was carried on by Roman Catholic orders. Many important Church institutions still exist and continue to do excellent work. The Protestants have also established hospitals, free clinics, and a home for orphans. Aid is given to many private societies for the prevention of tuberculosis and other diseases. The Philippine General Hospital, at Manila is one of the most modern institutions in the Eastern Hemisphere. There is also a system of provincial hospitals.

The segregation of lepers, with the view of the final extermination of the disease, was begun in 1906, but it was not until 1911 that anything like a complete collection of all the lepers was made. At the close of the fiscal

PHILIPPINE ISLANDS

STREET SCENES IN THE PHILIPPINE ISLANDS
1. MALASIQUI 2. SAN CARLOS

year 1913 there were in the colony 3298 lepers, of whom all but 23 were Filipinos. The number of lepers is gradually decreasing. The bubonic plague has been practically stamped out, and in the fiscal year ending 1913 only two cases were reported. Progressive measures for the eradication of mosquitoes resulted in greatly improved conditions in Manila.

The annual birth rate in the various provinces during the half year ending June 30, 1913, was 4.06 per thousand. The total number of births was 138,578. The total number of deaths in the same period was 68,598. In Manila the annual birth rate in 1913 was 35.33 per thousand, and the death rate 23.18.

It may be said, on the whole, that the health of the natives is good, but the climatic conditions are not favorable to long residence by Americans or Europeans. Relief may be obtained during the hot season by such of these as are able to remove to the mountains. The best known of these asylums is the elevated plateau of the Benguet, 150 miles north of Manila. In this plateau has been built the so-called summer capital Baguio.

Religion. Under the treaty of peace of Dec. 10, 1898, religious freedom is guaranteed to all the civilized people of the islands are Roman Catholic. Most of the parishes were administered by Spanish friars of the Dominican, Franciscan, and Augustinian orders, assisted by many native priests in the small parishes and missions, and since the American occupation several priests from the United States have been appointed to bishoprics. The Moros, living in the south, and the pagan wild tribes of the mountains are the leading non-Christian classes.

Government. For a time after the transfer of the Philippines to American control the islands were held under military government subject to the orders of the President of the United States. In January, 1899, a Commission was appointed by the President to aid in the humane and pacific extension of United States authority throughout the islands and to investigate and report upon conditions. In April, 1900, the President appointed a second Philippine Commission to continue and perfect the work of organizing and firmly establishing the government already begun by the military. On Sept. 1, 1900, this body began to exercise the legislative power and to appoint officers under the judicial, education, and civil-service systems, and later in municipal and provincial governments, the military government remaining supreme in any given territory until the Commission assumed jurisdiction. A municipal code was enacted Jan. 31, 1901, and was gradually applied to most of the towns inhabited by civilized Filipinos. It provided an electoral system, the exercise of the franchise being limited to male citizens of the Philippine Islands, 23 or more years of age, who had held certain municipal offices under Spanish rule, or owned real property worth \$250, or annually paid at least \$15 of taxes, or spoke, read, or wrote English or Spanish. Municipal authorities were given local autonomy except for supervision over their expenditures. The treasurers were appointed, but all other municipal officers were elected. Municipalities were later grouped in provinces organized under a provincial government act. Each province had an elective governor, chosen by the municipal councilors, a

treasurer, and a supervisor or engineer officer, both appointive, the three constituting a provincial board with certain limited powers. The provincial offices were all filled by appointment in the first instance. Later two or more provinces were grouped in districts over which a single engineer officer exercised supervision, and provision was made for elective third members of provincial boards.

Filipino towns in a few backward provinces, and all settlements of the non-Christian inhabitants of such provinces, were at first organized under special acts, from which were afterward evolved a township government act and a special provincial government act, the latter applicable to all of the provinces inhabited chiefly by non-Christians, except the Moro Province, which was organized under a law of its own. In 1914 the Province of Agusan was added to the Moro Province, and the designation Department of Mindanao and Sulu was given to the resulting territorial division.

The change from military to civil rule was brought about gradually by cooperation between the civil and military officials. On July 4, 1901, Judge William H. Taft, President of the Commission, was inaugurated as civil governor with jurisdiction over the provinces in which civil government had then been established, and thereafter the authority of the military governor terminated in each province upon the application to it, by the Commission, of the provincial government act.

On Sept. 1, 1901, a complete civil central government was established by the creation of four executive departments in charge of secretaries. Commissioner Worcester was made Secretary of the Interior, Commissioner Wright Secretary of Commerce and Police, Commissioner Ide Secretary of Finance and Justice, and Commissioner Moses Secretary of Public Instruction.

There followed the establishment of the necessary administrative bureaus and offices. Their number has been subject to modification. In December, 1914, they were the Executive Bureau, the Bureau of Audits, the Bureau of Civil Service, the Bureau of Health, the Bureau of Lands, the Bureau of Science, the Bureau of Forestry, the Weather Bureau, the Philippine Constabulary, the Bureau of Public Works, the Bureau of Posts, the Bureau of Coast and Geodetic Survey, the Bureau of Labor, the Bureau of Justice, the Bureau of Customs, the Bureau of Internal Revenue, the Bureau of Education, the Bureau of Agriculture, the Bureau of Prisons, the Philippine Library, the Bureau of Supply, the Bureau of Printing, the University of the Philippines, and the Board of Public Utilities Commission. Three Filipino members were added to the Commission on Sept. 1, 1901, and a fourth on July 6, 1908. It remained the sole legislative body until the inauguration of the Philippine Legislature on Oct. 16, 1907, and prior to that date enacted a comprehensive code of laws for the government of the islands. On June 11, 1901, it passed an act reorganizing the judicial system by establishing a supreme court of seven justices appointed by the President, and 16 courts of first instance with judges appointed by the civil governor subject to confirmation by the Commission. The Chief Justice and two justices of the Supreme Court were, and still are, Filipinos. A majority of the first appointees to judgeships of first instance were

Americans. This condition was gradually changed as competent Filipinos became available, and they are now in the majority. Peace courts were also provided and granted proper jurisdiction. Their justices, practically all of whom were Filipinos, were at first paid from fees. The system was unsatisfactory until fixed salaries were authorized, since which time it has been greatly improved. A special government was provided for Manila under an alcalde or mayor, with an appointive municipal board of three members. The latter have since been made elective.

The important Act of July 1, 1902, approved and confirmed the orders of the President for the establishment of civil government and provided a comprehensive system of government. Citizenship was defined as including all inhabitants of the Philippines who were subject to Spain residing in the Philippines when the treaty with that country was ratified on Feb. 8, 1899, who had not elected to retain their Spanish citizenship. The substance of the bill of rights of the Federal Constitution, except the right to bear arms and the right to trial by jury, was extended to the Philippines.

This Act directed the President of the United States to have a census of the islands taken upon certification by the Commission that a state of general and complete peace had been established, and provided for election two years later of members of a legislative Lower House, called the Philippine Assembly. The Commission was then to constitute the Upper House, and the two Houses were to form the Philippine Legislature, with jurisdiction over all territory in the islands save that inhabited by Moros or other non-Christian tribes, which was to remain under the exclusive legislative control of the Commission. The Philippine Assembly was to be composed of elective members distributed among the regularly organized provinces according to their population, with the proviso that each such province should have at least one delegate, the special government provinces, inhabited largely by non-Christians, not being represented at first. Two of them were subsequently granted representation. The qualifications of electors were made identical with those required in municipal elections. The Legislature holds yearly 90-day regular sessions and may hold special sessions of not more than 30 days each.

The Act of July 1, 1902, further provided for the choice by the Legislature at its first session, and biennially thereafter, of two resident delegates to the United States. They have the privilege of the floor of the House of Representatives, but are not entitled to vote.

The judicial system established by the Commission continued in effect. The United States Supreme Court was given appellate jurisdiction over all judgments of the Philippine Supreme Court involving more than \$25,000 or in which the constitutionality of any right or title claimed under the authority of the United States is in question. The Governor, Vice Governor, members of the Commission, secretaries of departments, and justices of the Supreme Court are appointed by the President, with the advice and consent of the Senate. Congress reserves to itself the power to annul all laws passed by the Philippine Legislature. The insular government was authorized to issue bonds and to purchase certain lands belonging to reli-

gious orders in connection with which a serious agrarian problem had arisen. Provisions were prescribed controlling the issuance of municipal bonds and the granting of franchises. The coinage of money by the insular government was authorized and provided for. The Division of Insular Affairs, organized by the War Department, was continued as the Bureau of Insular Affairs, to which were assigned all matters pertaining to civil government in the island possessions of the United States and subject to the jurisdiction of the War Department.

Ethnology. The first inhabitants of the Philippine Archipelago were doubtless the pygmy blacks, generally known as Negrito. This name was first applied to them by the Spaniards because of their diminutive size and color, which varies from a chocolate brown to a very dark sepia, and also because they resemble the negro race in other respects. Their hair is woolly; noses flat, broad, and spreading; chins feebly developed; lips thick, but not so protruding as in the African negro. Their heads are short and bullet-shaped. In size the men average 4 feet, 9 inches and the women 4 feet, 6 inches.

There is sufficient evidence that this race once occupied the entire archipelago, but it is equally certain that they were never a powerful people. From the earliest times they were broken up into small nomadic bands, each under the leadership of a local chief or headman.

In hunting they made use of bows and arrows, and blowguns. Fire for cooking was obtained either by rubbing a bamboo saw across a grooved section of the same material until the friction produced a spark or by sawing a rattan band between bark cloth and a soft piece of wood.

Following the pygmies came a people of Malayan blood, larger of frame, keener of intellect, and possessing metal tools and weapons. Doubtless these invaders, then as now, were head-hunters, and their desire for trophies, as well as for loot and slaves, caused them to wage unceasing warfare against the little blacks, whom they killed, enslaved, or drove back to the inaccessible fastnesses of the mountains, where a remnant of them is still to be found.

The newcomers did not enter the country in a single invasion, but came as wave after wave of migration. Neither did they move and settle as tribes, but formed themselves into small communities which were at war with all others.

It is probable that they at first settled only on the coasts, but later the pressure of population carried them to every part of the archipelago, where under varying conditions they developed many dialects and local customs. In the rugged mountains of north Luzon they became intense agriculturists and brought much of the land under cultivation by means of terraces. These terraces, in which they grow their rice, often extend for hundreds of feet up the steep mountain sides, while water for irrigation is carried long distances by means of flumes and ditches. In the south agriculture was less developed, but even there it furnished most of the tribes with their chief means of livelihood.

Ironworking seems to have been an ancient art with this people, who on their primitive forges turned out the excellent tools and weapons needed in their work and warfare. To-day these early invaders are represented by

such tribes as the Igorot, Ifugao, and Tinguian of northern Luzon, and the Bukidnin, Manobo, and Bagobo of Mindanao.

It is probable that prior to the fourteenth century the Chinese were carrying on considerable trade with the southern Philippines, and at about the same period the Hindu civilization of Sumatra and Java began to make itself felt in the islands of the north. It is probable that it was at this time that certain tribes secured the alphabets which were in use at the time of the Spanish Conquest.

About the year 1400 the faith of Islam swept over the whole Malayan region. Mohammedan Malays began to settle in the southern Philippines, while many of the earlier inhabitants accepted the faith of the newcomers. Soon they came into possession of firearms and from that time on became the most aggressive people in the islands. For purposes of trade they made long sea trips towards the north and south, while for loot and slaves they ravaged every part of the archipelago. To-day their descendants, known as Moro, are found chiefly in Mindanao and the islands of the Sulu group.

This was the condition at the time of the discovery of the islands by the Spaniards—the Mohammedan Moro holding the southern islands; a less advanced people of the same blood, but pagan, inhabiting the west coasts of the larger islands, in the interior of which their still less advanced kinsmen dwelt; and finally, small groups of the pygmies inhabiting the remote or inaccessible regions.

Among these tribes, which are now collectively known as Filipino, the most important numerically is the Visayan, whose members possess the central portion of the archipelago. Next in numbers is the Tagalog of central Luzon, now the most advanced group in the islands. Following them is the Ilocano, which occupies the whole western half of north Luzon. The members of this tribe are of an adventurous and aggressive disposition and are now spreading to all parts of the archipelago, particularly into the valley of the Cagayan River of Luzon. Other important tribes are the Bicol of south Luzon; the Pampanga and Pangasinan, residing north of Manila Bay; and the Cagayan of north-central Luzon. All these tribes are agricultural, but sea life, particularly fishing, takes up the time of a considerable part of the coast population.

While there are local and tribal differences between these Malayan peoples, yet there is such a general similarity that a single description can be given for all. The men average about 5 feet, and the women 4 feet, 8 inches in height; their heads are short and broad; their hair is brown black and inclined to be slightly wavy; while in color the people range from a light to a dark reddish brown. Life in the high mountains has given to the people of the interior an almost perfect physique, which is not obtained by the dwellers in the lowlands.

With Spanish rule came an increased number of emigrants from other lands, especially from China. Many of these intermarried with the natives, and from them has sprung up a powerful element known as mestizo. This class has devoted itself largely to trading and dominates the business activities of the Philippines.

History. In accordance with the Demarcation Bull of Pope Alexander VI of May 4, 1493, the Spaniards were to make discoveries and to

establish colonies beyond a meridian line in the Atlantic 100 leagues west of the Azores (later by the Treaty of Tordesillas, June 7, 1494; 370 leagues west of the Cape Verde Islands), while the Portuguese were to confine their efforts to the field of discovery east of that line. In the race for the control of the spice trade of the East Indies the Portuguese came off victorious, for they reached the Moluccas or Spice Islands the year before Balboa discovered the Pacific Ocean, revealing that the Spaniards had found, not the Indies, but a great barrier continent that blocked the way thither.

The Moluccas lay so far to the east of India as to make it probable that if the demarcation line were extended round the earth they would be found to be in the Spanish half of the globe. It was to demonstrate this hypothesis and carry to completion the great design of Columbus to find a western route to the Spice Islands that Magellan undertook his voyage around America and across the Pacific. In March, 1521, he discovered a group of islands which he named after St. Lazarus, whose festival was celebrated early in his stay among them. A few weeks later the heroic navigator lost his life in a skirmish with the natives on Maetan Island, near Cebu. That he had achieved his project and proved that the Spice Islands lay within the Spanish half of the world was accepted by King Charles of Spain, but the impossibility of accurately determining longitude in those days, the difficulties of the voyage through the Strait of Magellan and across the Pacific, and financial necessities led him to relinquish all claims to sail or trade west of a new demarcation line, in the antipodes, 297 leagues east of the Moluccas (Treaty of Saragossa, 1529). This really surrendered all rights to the newly discovered islands of St. Lazarus, which were to the west of the Moluccas. The conquest of Mexico and the establishment there of the prosperous Viceroyalty of New Spain removed the difficulties presented by the navigation of the Strait of Magellan, and, in contravention of the provisions of the treaty, an expedition was dispatched to the islands in 1542 under the command of Villalobos. This expedition had no permanent result beyond giving to the group the name of *Islas Filipinas*, in honor of the Prince, later King Philip II. The permanent conquest of the islands was achieved under Legaspi at the head of an expedition fitted out in Mexico. Legaspi arrived at Cebu in April, 1565. It was three years before his first reinforcements came and five years before the conquest of Luzon was undertaken. In June, 1571, the city of Manila was founded, and this became the seat of the Spanish power. Within the next year great progress was made, and at the time of Legaspi's death, in August, 1572, the Spanish authority was securely planted in the islands and the conversion of the natives considerably advanced. Legaspi's force was small, and the conquest was accompanied by relatively little bloodshed. The lack of social and political cohesion among the natives, the weakness of their religious beliefs, and the rivalries and hostility of the local chieftains opened the way for a patient and tactful prosecution of the policy of divide and rule; one chief after another was won over to the Spaniards, the picturesque ceremonials of the Church appealed to the artistic sense of the people, and the simple clanlike social organization was

skillfully utilized by the Spaniards as the basis of their rule. Lying on the extreme verge of the vast Empire of Spain, the islands were commonly known as the Western Islands (*Islas del Poniente*). The Portuguese protested against this invasion of their East Indian realm, but the conquest of Portugal by Spain in 1580 settled the question before there had been any serious collision. More formidable than the hostility of Portugal or the resistance of the natives were the incursions of Chinese pirates and later the attacks by the Dutch, who during their great contest with Spain made their way to the Indian seas and took possession of the Spice Islands.

The dominating impulse in this remote extension of Spanish power had been religious rather than commercial. The new conquest was to be an outpost of Christianity facing the great Asiatic heathen world. From it as a base the missionaries could prosecute their labors effectively in China and Japan. Religious purposes and interests continued to dominate the life of the islands for over three centuries. At the outset they were a great mission, like the more familiar Jesuit missions in Paraguay, and it is as a mission that the history of early Spanish rule should be studied and its results estimated. The Christian population steadily increased, and the requirements of religion, while rigorously enforced, were not more burdensome than in Europe.

In the earlier days there was little oppression and little exploitation of the people. Plantation slavery, the dark page in West Indian colonization, never existed, although household slaves were common with many of the tribes and are still held in small numbers even by Filipinos. An Act passed by the Philippine Legislature in 1913 prohibits and penalizes slavery in the regularly organized provinces.

The Christian population of the islands formed a unique community, the only large body of Asiatics permanently converted to Christianity in modern times. In its general framework the administration of the islands as a Spanish dependency was modeled on the system introduced into America, which in turn was an adaptation of that existing in the provinces of Spain. At the head was the Governor with viceregal powers, having by his side the Audiencia or Supreme Court. This body served not only as the highest court of appeal, but also as a check upon the arbitrary authority of the Governor. Another important restraint upon that official was the *residencia*, or obligation to stand ready to answer all charges of misbehavior which should be preferred during a period of six months after the termination of his tenure of office. At the outset the heads of the provincial administration were the *alcaldes mayores*, whose functions were both executive and judicial. In his judicial duties the *alcalde mayor* was assisted by an assessor and a notary. The administrative division below the province was the *pueblo*, which was ruled by the petty governor or *gobernadorcillo*, who was originally elected by the general suffrage of the married inhabitants of the *pueblo*, but in later years was chosen by a small body of 13 electors. Within the *pueblos* the population was subdivided into little clanlike groups of 40 or 50 families called *barangays*, a survival of the earlier native organization, each under a *baran-*

gay headman (*cabeza de barangay*), who was held responsible for the taxes of his group and served without pay. The *gobernadorcillo* was held responsible for all taxes due from his town. The *gobernadorcillos* and headmen of *barangays* were Filipinos; the higher administrative officers were Spaniards. The inhabitants of the *pueblos* were mostly natives. Few Spaniards lived in these mission villages except the friars. In the few Spanish towns there existed the ordinary municipal organizations that prevailed in Spanish America. There was the town corporation, *el cabildo* (chapter), consisting of two *alcaldes* (justices), eight *regidores* (aldermen), a registrar, and a constable. The members of the *cabildo* held office permanently. Membership could be bought and sold or inherited.

At the head of the ecclesiastical administration stood the Archbishop of Manila, the bishops of Cebú, Segovia, and Cáceres, and the provincials of the four great orders of friars (the Dominicans, Augustinians, Franciscans, and Recoletos) and of the Jesuits. The members of these orders (the regular clergy) greatly preponderated in numbers and influence over the secular clergy, who were mostly natives.

The economic development of the islands was at first rendered impossible by the manufacturers in Spain, who demanded protection against Asiatic competition in the markets of Mexico and Peru and secured the restriction of the imports from the Philippines to the cargo of an annual ship. Even at the close of Spanish rule the insular government remained hostile towards the development of the great natural resources of the islands and the investment of foreign capital, and under this handicap the islands never were self-supporting. For many years their principal trade was with China and was in the hands of the Chinese. Spain, drawn into the maelstrom of the Seven Years' War in the vain hope of recovering Gibraltar, lost the Floridas and saw Havana and Manila fall before English fleets. The preliminaries of peace, however, had been agreed upon before news reached England of the capture of Manila, and the conquest was therefore relinquished to Spain. The reforming government of Charles III exerted its activities even to the remote Philippines. The Royal Philippine Company was chartered to carry on direct trade between Spain and the islands (1765). Three years earlier the enterprising Governor-General Basco y Vargas, to make the colony self-supporting, introduced the government tobacco monopoly (1782), by which lands suitable for growing tobacco were arbitrarily pressed into that service and the cultivators compelled by forced labor to produce stipulated amounts to be sold to the government at fixed prices. This system of compulsory labor was practically the first attempt really to exploit the resources of the islands and during the following century was fruitful in abuses and of the seeds of revolt. It was abolished in 1882. In this connection should be mentioned the *polos y servicios*, forty days' required labor on the roads, bridges, public buildings, etc., which was exacted of the natives in addition to their tribute. The name was later changed to *prestación personal* and the period to 15 days.

The Mexican revolution severed the ancient connection of New Spain with the "Western Islands," and the Spanish constitution of 1812,

which embodied the principles of the French Revolution and which put all parts of the Spanish Empire on an equality and admitted the Philippines to representation in the Cortes, led the natives to believe that now they would be exempt from tribute and *polos y servicios*. Consequently, when the news came that Ferdinand VII in 1814 had abolished the constitution of 1812, the Ilocanos rose in rebellion. Henceforward the agitations of home politics and the example of the Spanish-American states steadily undermined the oldtime stability of conditions in the Philippines. The mission system could not be maintained in its integrity. The number of Spaniards in the islands increased, the spirit of colonial exploitation grew, the monastic orders which combined the functions of landlords and spiritual guides were more and more pervaded with the mercantile spirit. Nor did their predominant influence in the government of the islands at all diminish in an age progressively hostile to clerical control. The opening of the Suez Canal brought the Philippines relatively near to Europe and more than ever exposed them to the contending forces of modern thought. Promising young Filipinos completed their education in Europe. By a few weeks' voyage they found themselves in many respects transported from the sixteenth century to the nineteenth. That they should contentedly return to the earlier age was impossible. The Spaniards did not weather the transition. The final collapse began with the insurrection of 1896, which was primarily an agrarian revolt aimed at the expulsion of the orders from their estates and the islands.

The Liga Filipina was founded by Dr. José Rizal (q.v.) to work for the expulsion of the friars and to secure the same political concessions for the islands that had been granted to Cuba, a larger recognition of the natives in the appointments to civil offices, and freedom of the press and of association. More radical than this was the Katipunan, which was established in 1892 to secure independence by open revolt and began by wholesale assassinations of Spanish officials and friars. The existence of an elaborate plot was revealed by a native, Aug. 19, 1896, and on the 25th the mask was entirely thrown off. The garrison of Manila consisted of only 300 Spanish regulars and about 1200 native soldiers. The total number of Spanish soldiers in the islands was under 2000. The authorities could act only on the defensive until October, when reinforcements began to arrive from Spain. On the other hand, the insurrectionists were hampered by a great lack of arms and ammunition. The insurrection centred in the Province of Cavite, which was under the control of the rebels until their power was broken in the spring of 1897 by the vigorous campaign of General Lachambre. Its leaders were Andrés Bonifacio, the head of the Katipunan, and Emilio Aguinaldo (q.v.). Bonifacio was killed probably at Aguinaldo's order.

After organized resistance had been shattered it seemed wise to the Governor-General, Primo de Rivera, to attempt to secure peace by obtaining the withdrawal of the native leaders from the islands. This end was accomplished by the Treaty of Biacnabat6, under the terms of which Aguinaldo and certain other leaders were to take up their residence outside of the islands in consideration of the payment to them of

\$800,000 (Mexican). Aguinaldo and his associates claimed that they had been promised administrative and other reforms, and as they were not carried out organized a junta, or revolutionary committee, at Hongkong. It included most of the Philippine political exiles there.

The Filipino members of the junta fell to quarreling over the division of the money actually paid to them, and Isabelo Artacho ultimately attempted to institute legal proceedings against Aguinaldo, who started for Europe in order to escape them. When the United States declared war against Spain on April 21, 1898, he had just reached Singapore and had an interview with United States Consul-General Pratt with reference to coöperating with Commodore Dewey. At this time the junta definitely formulated the plan of obtaining arms from the Americans, utilizing the latter to aid in ejecting the Spaniards and then attacking them if they did not subsequently leave the islands of their own accord. The junta decided that Aguinaldo ought to go to the Philippines. He and other leaders were taken there on the United States supply ship *McCullough*, which sailed on May 17, 1898. On May 1 the Spanish fleet in the Bay of Manila had been annihilated by the United States Pacific squadron under Commodore Dewey. When Aguinaldo arrived at Cavite on May 19, he was promptly sent ashore by Commodore Dewey and speedily returned greatly discouraged, but later, having been allowed to take possession of arms and ammunition which had belonged to the Spanish garrison, succeeded in organizing a force which operated successfully against other Spanish garrisons in neighboring provinces and ultimately closely invested the city of Manila.

Manila lay at the mercy of Dewey's guns, but he could not garrison the place, and the Filipinos could not be trusted to do so. He therefore awaited the arrival of adequate land forces, after which the position of the Spanish forces was hopeless. They realized this fact, and the surrender of the city was arranged for through the Belgian Consul André. After the surrender of Manila Aguinaldo demanded Malacañan Palace for himself, and a share in the war booty for his followers, and was embittered when informed that he could not have the palace and that there would be no war booty. His troops pillaged portions of the city, which they occupied, and committed many abuses. They were ultimately compelled to retire by General Otis, whose firmness and tact averted for the time what threatened to be an armed clash between Americans and Filipinos.

Meanwhile there had been signed at Washington. On August 12, the peace protocol providing that the United States should occupy and hold the city, bay, and harbor of Manila, pending the conclusion of a treaty of peace which should determine the control, disposition, and government of the Philippines. On October 31 the cession of the whole group was demanded by the American Commissioner.

In the treaty signed Dec. 10, 1898, Spain ceded the entire archipelago to the United States, and that country agreed to pay Spain \$20,000,000, give Spanish ships and merchandise admission to the islands on the same terms accorded to American ships and goods for a period of 10 years, and transport to Spain the Spanish soldiers captured at the surrender of

Manila. The treaty was submitted to the Senate of the United States Jan. 4, 1899, and it was ratified February 8.

In the meantime, on June 12, 1898, before the signing of the protocol of peace, Aguinaldo had proclaimed the independence of the Philippines. On June 18 he promulgated a decree for the creation and administration of municipalities. On June 23 he proclaimed the establishment of a revolutionary government with himself as President. On August 6 Aguinaldo made a further attempt to secure the recognition of his government, saying that it actually ruled in nine provinces of Luzon and in Mindoro. During the following month he gradually extended his authority, while the Americans continued to hold Manila, Manila Bay, and Cavite.

The Filipinos having succeeded in securing the ejection of Spain by the Americans, as they had originally planned, perfected an elaborate plan for attacking the latter, whom they expected to drive into the sea with little difficulty. President McKinley's proclamation of Dec. 21, 1899, announcing that the islands had been ceded to the United States and that military rule was to be extended over them as rapidly as possible, added further to the growing tension, and on the night of Feb. 4, 1899, hostilities broke out at Manila, when an insurgent patrol deliberately provoked the fire of an American sentry.

The acquisition of the Philippines was opposed in the United States by persons who believed it to be the beginning of imperialism and at variance with the traditional policy of the country, as well as by others who held that the islands would impose a heavy burden on the treasury of the United States and would be a source of danger because of their exposed position. It was favored by those who believed that the United States was under moral obligation to terminate Spanish rule in the archipelago and that annexation was the only means of preventing other nations from taking possession; and by others who held that the possession of the Philippines would be of great strategic importance in view of possible future complications in eastern Asia. The discussion of the points of view and the policy of the government were hampered by great lack of knowledge of the situation. To meet in part this difficulty, President McKinley appointed, in January, 1899, the previously mentioned first Philippine Commission, consisting of President Schurman of Cornell University, Admiral Dewey, Gen. E. S. Otis, the Hon. Charles Denby, and Prof. Dean C. Worcester of the University of Michigan, to investigate conditions in the islands and to labor for the acceptance of American rule by the natives. In March, 1899, the Commission began its work. On April 5 it issued a proclamation to the people of the islands, explaining the purpose of its mission and the intentions of the American government. The efforts of the Commission were devoted particularly to conciliating prominent Filipinos and to building up a party favorable to American rule. To do this concurrently with the vigorous prosecution of the war was uphill work. In May they had a conference with some representatives of Aguinaldo, but it came to nothing.

The operations of the American army disorganized the so-called republic, and the national

movement became embodied in the leadership of Aguinaldo. During the first nine months of the war disappointingly little headway was made by the Americans. The great majority of the engagements were within a radius of 50 miles of Manila. The military authorities exercised a rigid censorship over the press dispatches, so that it was practically impossible for the general public to know the real conditions. In the fall and winter of 1899 there was greater progress. Most of the country, from Manila to Dagupan, came under American control, and the native army was driven to the mountains. The principal events in 1900 and 1901 were in connection with the process of establishing civil government in the islands, for which see above under *Government*.

On March 23, 1901, Aguinaldo was captured, and on July 4 military government was superseded by civil government in the pacified districts. On July 4, 1902, the President proclaimed the Philippine insurrection at an end everywhere except in the Moro territory, abolished the office of military governor, and transferred the authority of that official to the civil governor and the Commission. On July 30, 1907, an election for members of the Assembly was held under a law passed by the Commission on January 9 of that year. The delegates were proportioned among 35 provinces, the number varying from one to seven according to population. The Mountain Province, the Moro Province, Agusan, and Nueva Viscaya were left without representation because of the predominance of Moros or other non-Christians among their people. The first session of the Philippine Legislature opened Oct. 16, 1907. Among the more important results of American rule are the abolition of brigandage and the establishment of an excellent state of law and order throughout the islands, including the territory of the wild tribes, much of which was previously unexplored; a revolution in sanitary conditions, with almost complete riddance of the archipelago from smallpox, bubonic plague, and Asiatic cholera, and the segregation of all known lepers; the placing of the currency on a gold basis; the reformation of the judicial system; the generalization of academic instruction through the establishment of primary and secondary schools and a university; the introduction into the primary schools of industrial work; the establishment of special industrial schools, and the training of more than 8000 Filipino school teachers through the development of an effective system of normal instruction.

Important special features of the school work have been systematic physical culture which has benefited the health of the children, and the introduction of athletic contests which have aroused the spirit of sportsmanship and have tended to diminish interest in cockfighting and gambling.

The checking of the spread of rinderpest among the draft animals has saved the island from complete industrial ruin. The construction of thousands of miles of improved roads, and of cart and horse trails and numerous fine bridges; has brought hundreds of thousands of small farmers within reach of the world's markets, and in combination with the establishment of an admirable state of public order and the judicious stimulation of agriculture has quadrupled the exports of the islands in a dec-

ade and a half of American rule. Their importance has increased in like proportion during the same period. An important factor in this result was the passage of the Payne Tariff Bill and of subsequent measures which opened to the Philippines the markets of the United States.

The establishment of freedom of speech and of the press and the protection and uplifting of many of the more backward tribes are milestones on the march of the Philippine peoples towards a higher civilization.

PHILIPPINE LANGUAGES. Many dialects are spoken by the inhabitants of the Philippine Archipelago. On the smaller islands and along the coasts of the larger more than a score of dialects have been recorded, while to these must be added an equally large number of idioms spoken by the pagan tribes of the interior. All these dialects, however, may be considered as subdivisions of Malay, which itself is a member of the Malayo-Polynesian family.

Several references to the language spoken by the aboriginal pygmy blacks, found in the writings of early travelers in the islands, seem to indicate that this differed radically from the Malay, in that it was of monosyllabic structure. While it seems probable that the pygmies did originally have a distinct language, there is at present no evidence of that fact, and to-day all the known groups of Negrito speak the language of their more advanced neighbors.

Several factors must be taken into consideration when attempting to account for the many dialects spoken by the Filipino. In the first place they represent several waves of migration rather than one wave. The newcomers settled in districts separated from one another by stretches of water, mountains, or other natural

barriers, and these hindrances to easy communication were, in time, sufficient to bring about linguistic differences. Still more potent was the fact that most of these invaders were head-hunters, and the hostile raids of one tribe against another made intercommunication impossible. The Tinguian tribe of northern Luzon affords a striking example of the influence of head-hunting on a language. The people of this group are of a physical type so uniform, and are so similar in culture and religious beliefs, it is safe to assume that they formed a single division until comparatively recent times; but the custom of head-hunting has divided them into five hostile groups, the members of which speak dialects not mutually intelligible.

The conversion to Mohammedanism of the people of the Sulu Archipelago and the Christianizing of the coast people of the middle and northern islands were factors of great importance in the development of Philippine tongues. Many Arabic and Spanish words entered the languages: Arabic script came into use in the south, and the Roman letters of the Spanish became the medium of written thought in the north. Even the structure of the language was modified in some instances through the efforts of Spanish and Mohammedan missionaries.

The influence of Chinese trade, which has been carried on for several centuries, is found in the vocabularies of nearly all the tribes, and the effect of the American occupation of the islands has been by no means inconsiderable.

An outside influence still earlier than any yet mentioned was that of India. Words of Sanskrit origin are found in every dialect, while the native script, found in use by the Spanish and still employed by two of the pagan tribes, seems to have been of Indian origin. One of these scripts still in use is that of the Tagbanana, of Palawan Island. In it only four characters corresponding to vowels are found: these are *a*, *o*, *ua*, *edi*. Fourteen other characters appear, but, as in the Indian alphabets, there is no way of expressing a consonant without a vowel. Hence every consonanted character represents that consonant plus the vowel *a*, unless secondary marks are added to indicate other vowel sounds.

Despite apparent dissimilarities the Philippine dialects possess so much in common it is evident that all are variants of one tongue. The following are some of the fundamental traits found in nearly all the dialects:

Each is, for the most part, built up of dissyllabic roots and monosyllabic particles. These roots, when standing alone, usually express nominal ideas, and grammatical relations are indicated by prefixing, infixing, or suffixing the particles. There is no grammatical verb.

Some of the particles express pronominal and adverbial ideas, while others are utilized only in the formation of verbs. Those used with the verb fall into two broad divisions—those with active, and those with more or less of a passive, signification. All in the first division, except the inchoative, which is sometimes used as an infix, usually appear as prefixes to the root, to which is suffixed the nominal form of the pronoun subject, followed by the oblique form of the object of the action. In this construction are found the particles indicating simple actions, particular or specific agency, causation, ability, community of action, and the inchoative.

In the second division is usually found a

suffix indicating a true passive, and in addition to this are prefixes, suffixes, and infixes which in meaning correspond to the active particles, yet seem to give to the verb a passive force. With all these forms the subject of the action is found in the following genitive, while the object, if expressed, is in the oblique case. Certain writers have with some reason called these possessive verbs. Verbs of this type are regularly used, unless it is desired to place special emphasis on the agent. Here are found the verbals expressing instrument, person, or place affected, person commanded, and the infinitive.

Considerable variation exists between the groups in the manner of expressing mode and tense, but most commonly a change in the initial letter of a prefixed particle accomplishes this result, as, e.g., in Ilocano *Mangsurat* indicates one who writes and *Nangaurat* one who wrote.

Existence and nonexistence are not expressed in the manner just described. For this purpose quasi verbs, without inflection, appear. Possession is shown by the noun with such a form with its possessive pronoun suffix.

The only inflections occurring in Philippine languages are found in the definite article and in the personal and demonstrative pronouns. In these three cases are distinguished a nominative and genitive which express ideas equivalent to those in English; in addition, the genitive designates agent and instrument. The third or oblique case corresponds closely to the dative and ablative of Latin and generally takes the place of the prepositions used in English.

Most of the dialects possess two forms for the nominative of the personal pronouns. The first is an independent emphatic form, while the nonemphatic appears as a suffix. A dual is found, and two forms for the first person plural—the first of which excludes the person addressed, while the second includes all persons present.

Inflection is secured for the verb by adding the suffixed forms of the personal pronouns. In negations these pronominal forms are always suffixed to the negatives. The suffixed forms of the genitive case regularly take the place of possessive pronouns.

Gender is expressed by the word for male or female, which follows its noun like a modifier. There is no method by which this distinction can be made in noun, pronoun, or verb.

The declined definite article shows the case, and usually the number, of the substantive before which it stands. However, a noun or an adjective may appear in its plural form if the idea of plurality is to be emphasized.

The use of ligatures is very extensive. They appear as connectives between words, phrases, and sentences, one of which modifies the other. Their use is also obligatory between an adjective or a substantive qualified and its noun, but with a demonstrative their use is irregular. The attributive ligature is usually the definite article, while quite a different form appears for the appositional.

All dialects possess a full series of vowel sounds, between which there is frequent interchange, even in the same dialect. Thus, *o* and *u* are continually confused, both in oral speech and in writing, while there is frequently a similar confusion between *e* and *i*. An indefinite vowel *e*, such as obscure *e* in *sure* or *ur* in *burrow*, is of common occurrence, either replacing *o*, *u*, or *a* or used independently.

The consonants, most of which are pronounced as in English, include labials, dentals, palatals, and the glottal catch or hiatus. In the palatal series is found a postpalatal nasal, written *ng* or *n*. The articulation is not clear, and the stop is not present, but the back of the tongue is well up on the soft palate.

One of the chief differences between the dialects is the interchange of consonants in words of like origin. Among the most common of these are the change of *r*, *d*, and *w* into *l*, *d* into *dj*, *k* into *g*, final *k* into a glottal catch; *f* and *v* occur in only a few dialects, in which they regularly replace *p*, *b*, or *u*.

There is about an equal division between vowels and consonants in the various dialects, and since consonantic clusters are rare the language is soft and musical.

An intervocalic consonant always goes with the next vowel, or if two consonants occur between vowels they are divided and one goes with each vowel. This makes possible the rule that there are as many syllables as there are vowels or diphthongs. In words of two or more syllables accent usually falls on the penultima, but in polysyllabic words a secondary accent is placed on the ultima.

The principal dialects now in use and their locations are: *Ilocano*, northwestern Luzon; *Pangasinan*, middle-western Luzon; *Pampango*, central Luzon; *Tagalog*, Manila, middle Luzon, and coasts of Mindoro; *Bikol*, southern Luzon, *Visaya*, Visayan Islands and the northern and eastern coasts of Mindanao; *Sulu*, Sulu Archipelago and northwestern Mindanao; *Maguindanao*, southwestern Mindanao.

lect (Manila, 1908); C. W. Seidenadel, *First Grammar of the Language Spoken by the Bontoc Igorot* (Chicago, 1909); C. E. Conant, *The Pepet Law in Philippine Languages* (ib., 1913).

PHILIPPINES, UNIVERSITY OF THE. An institution for higher education established by act of the first Philippine Legislature in 1908. It took over the already existing Philippine Medical School, which had been established in 1905 and opened in 1907. Different schools and colleges have been added since 1908, and the university now consists of a College of Liberal Arts, a College of Medicine, a College of Engineering, a College of Law, the School of Pharmacy as part of the College of Medicine, a College of Veterinary Science, the School of Education as part of the College of Liberal Arts, and a School of Fine Arts. All these departments are located at Manila. The College of Agriculture is located at Los Baros, Laguna Province. The College of Liberal Arts grants the bachelor's degree after two years and the master's degree after three additional years of study; the courses in other fields vary from three to five years in length. The government of the university is in the hands of a board of regents, six holding office ex officio and five appointed by the Governor-General. The enrollment in the university, excluding the School of Fine Arts, was 704 in 1912-13. The president in 1915 was the Rev. Murray Bartlett, D.D.

PHILIPPONS. A Russian sect, a branch of the Raskolniki (q.v.), who emigrated to Lithuania and East Prussia at the beginning of the eighteenth century. They take their name from their leader, Philip Pustosviit. They are described as peaceable and orderly, skilled in agriculture, thrifty, and industrious. They refuse to take oaths or perform military service, and set a high value upon suffering and death for conscience' sake. Priestly duties, such as leading in worship, baptism, and absolution, are performed by the oldest of the community. They do not observe the Lord's Supper and have no confirmation or religious marriage ceremony. Their religious services consist in singing psalms and reading the Gospels.

PHILIPPOLIS (Bulg. *Plovdiv*, Turk. *Pilibe*) The largest city of Bulgaria next to Sofia, and formerly the capital of eastern Rumelia. It is situated in a wide, fertile plain at the head of navigation on the Maritza River, on the railway between Constantinople and Sofia, 80 miles southeast of the latter city (Map: Balkan Peninsula, E 3). Most of the houses are of wood, but the city has been much enlarged and beautified by the laying out of new streets and public parks, such as the beautiful Exhibition Park, laid out in 1892, and the growing up of fine residential suburbs containing the villas of wealthy Greeks and Bulgarians. The city is the seat of an Orthodox archbishop and has a new Orthodox cathedral, besides a number of other Christian churches and many mosques. There are also a college and a national library. Philippopolis is the chief commercial centre of central Bulgaria, and has an active trade in the products of its manufactures, such as silk and cotton fabrics and attar of roses, as well as in rice, grain, tobacco, and hides. Pop., 1910, 47,981, of whom the majority are Bulgarians, the remainder being mostly Turks and Greeks. Philippopolis was an important Thracian city in ancient times. It was almost wholly destroyed by an earthquake in 1818, and again by fire in

1846; but it recovered rapidly, owing to its excellent trade facilities.

PHILIPPOTEAUX, fêl'pô'tô', Félix (1815-84). A French painter of battle scenes. He was born in Paris and was a pupil of Léon Cogniet. His thorough knowledge of military details enabled him to depict the turmoil of battle with great historical truth but somewhat dryly, as may be judged by "Louis XV Inspecting the Battlefield of Fontenoy" (1840, formerly in the Luxembourg Museum) and the "Battle of Rivoli" (1844, Versailles Museum). His "Last Banquet of the Girondists" (1850, Marseilles Museum) is also worthy of notice. He is well known as a painter of panoramas, which he improved greatly. (See PANORAMA.) He received the cross of the Legion of Honor in 1846.

PHILIPPSBURG, fêl'p's-burk. A town in the Grand Duchy of Baden, situated near the Rhine, 17 miles north of Karlsruhe. It manufactures cigars; in the vicinity are tobacco and hop plantations. It was once a noted fortress, founded by Philip Christopher von Sötern, Bishop of Speyer, in 1618. It played a conspicuous part in the wars of the seventeenth century, and the fortifications were destroyed in 1809. Pop., 2600.

PHILIPPSON, fêl'p-zôn, MARTIN (1846-). A German historian, born at Magdeburg. He studied at Bonn and Berlin, became docent at Bonn in 1871, and in 1878 professor in the University of Brussels. From this post he resigned in 1890 after a sharp quarrel with the anti-German student body, and returned to Berlin. Philippson wrote: *Geschichte Heinrichs des Löwen* (1868); *Heinrich IV. und Philipp III.* (1871-76); *Geschichte des preussischen Staatswesens vom Tode Friedrichs des Grossen bis zu den Freiheitskriegen* (1880-82); *Histoire du règne de Marie Stuart* (3 vols., 1891-92); *Kurfürst Friedrich Wilhelm von Brandenburg* (1879-1901); *Kulturgeschichte Europas seit dem Ausgange des Mittelalters* (1898); *Das Leben Kaiser Friedrichs III.* (1900; 2d ed., 1906); *Der Grosse Kurfürst* (1897-1903); *Geschichte des jüdischen Volkes in der neuesten Zeit* (3 vols., 1911). He founded also the *Allgemeine Zeitung des Judentums*.

PHILIPPOS SIDETUS. An Asiatic Church father who wrote about 150 A.D. Only a few fragments of his works have been preserved. See DE BOOR FRAGMENT.

PHILLIPS, AMBROSE (1875-1749). An English poet, born in Shropshire, probably in 1875. He was graduated from St. John's College, Cambridge (B.A., 1896; M.A., 1700), and was elected fellow of his college, but resigned his fellowship (1708) and traveled on the Continent. From Copenhagen he addressed (March 9, 1709) an *Epistle to the Earl of Dorset*, which was published in the *Tatler* (No. 12) with warm praise by Steele. The same year appeared his pastorals in Tonson's *Miscellany*, along with Pope's *Pastorals*. Then ensued a controversy as to which poet had better succeeded. Both series are artificial. Phillips was angered by a mock commendation of his pastorals which Pope contributed to the *Guardian* (No. 40), and he is said to have hung up a rod at Button's coffee house for chastising his adversary, but no encounter ever took place. Phillips was, however, remembered in the *Dunciad*. In ridicule of Phillips, Gay wrote the *Shepherd's Week* (1714), descriptive of rustic life with the gilt off. In 1712 Phillips was lauded for his adaptation of Racine's *An-*

dromaque. In 1718-19 he edited an imitation of the *Spectator* called the *Freethinker*. His support of the government led to his appointment as secretary to Bishop Boulter in Ireland (1724). He also represented Armagh in the Irish Parliament; was made secretary to the Lord Chancellor (1726) and judge of the Prerogative Court (1733). He died in London, June 18, 1749. Phillips also translated the odes of Sappho (1713), once thought to be a brilliant achievement. Perhaps his best work is represented by several short poems to children (1725-26). Consult Alexander Pope, *Works*, edited by Elwin and Courthope (10 vols., London, 1871-89), and Samuel Johnson, *Lives of the British Poets*, vol. iii, edited by G. B. Hill (ib., 1905).

PHILLIPS, FRANCIS CHARLES (1849-). An English novelist and playwright. He was born at Brighton, was educated at Brighton College and at Sandhurst, but after entering the army decided to follow the law and in 1884 was called to the bar. About this time he began, without abandoning his practice, to write both plays and novels. Of the latter the most noted, *As in a Looking Glass* (1885), was adapted for the stage and was played by Mrs. Bernard Beere in London and by Sarah Bernhardt in Paris. Another novel, *The Dean and his Daughter*, was dramatized very successfully by Phillips and Sydney Grundy as *The Dean's Daughter* (1888). Phillips wrote in all about 30 novels and, in collaboration with Charles Brookfield, Leonard Merrick, and Walter Parke, various plays besides those named.

PHILLIPS, or **PHILLIPS**, JOHN (1676-1709). An English poet, born at Bampton, Oxfordshire, Dec. 30, 1676, and educated at Winchester School and at Christ Church, Oxford. He died at Hereford, Feb. 15, 1709. Phillips is still known for two poems—the *Splendid Shilling*, a mock-heroic poem in Miltonic blank verse (1701), and *Cyder* (1708), on the plan of Vergil's *Georgics*. The first was translated into Latin and the second into Italian. As a Tory reply to Addison's *Campaign* Phillips wrote *Blenheim* (1705). Phillips was among the few poets between Milton and Thomson to cultivate blank verse. The 1715 edition of Phillips's *Poems*, a collective edition, contains a *Life* by George Sewall. Consult Samuel Johnson, *Lives of the British Poets*, edited by G. B. Hill (London, 1905).

PHILLIPS, KATHARINE (1631-64). An English poet, better known by her literary nickname, "the matchless Orinda." She was born in London, the daughter of John Fowler, a well-to-do merchant. In 1647 she married a Welshman, Hector Phillips, son of her mother's second husband; four years later she addressed Henry Vaughan in what seems her first poem, and she soon formed that literary and friendly circle which included Jeremy Taylor and Sir Charles Cotterel and in which she took the name Orinda. She spent the year 1662 in Dublin and there made many friends among the Royalist party, with which she had sentimentally allied herself, and translated Corneille's *Pompée* with great success. *Horace* she did not live to complete, for she died of smallpox in her thirty-third year. Her poems were highly praised by her contemporaries. Her *Letters to Poliarchus* (Sir Charles Cotterel) were published in 1705. An edition was published in 1905. Consult Edmund Gosse, *Seventeenth Century Studies* (new ed., New York, 1914).

PHILIPSBURG. A borough in Center Co., Pa., 39 miles by rail north by east of Altoona, on the Mushannon Creek and on the New York Central and Hudson River, the Pennsylvania, and the Pittsburgh and Susquehanna railroads (Map: Pennsylvania, E 5). It is situated in the Clearfield coal region and has extensive mines of bituminous coal. Deposits of clay also are found in the vicinity, and there are foundries and machine shops, flouring and planing mills, and manufactories of shovels, cigars, bricks, tools, etc. It is the seat of Cottage State Hospital and has Trinity Protestant Episcopal Church, erected in 1828, and two sanitariums. Pop., 1900, 3266; 1910, 3585.

PHILIP THE BOLD (1342-1404). Duke of Burgundy from 1363 to 1404. He was the third son of John the Good, King of France. He was present in 1356 at the battle of Poitiers (q.v.), and displayed such courage, venturing his own life to save that of his father, that he became known as *le Hardi* (the Bold). He shared his father's captivity in England, and on returning to France in 1360 received in reward of his bravery the Duchy of Touraine, and subsequently (1363) also that of Burgundy, being created at the same time the first peer of France. In 1369 he married Margaret, the daughter and heiress of Count Louis de Maële of Flanders. On the death of King Charles V, in 1380, he became Regent, together with his brothers, for his nephew, Charles VI. In 1382, at the head of a French army, he marched against Philip van Artevelde, the leader of the Flemish burghers in their revolt against their count, and overwhelmed him in the battle of Roosebeke. Flanders and Artois fell to him by the death of Louis in 1384. Energy and wisdom characterized his government; arts, manufactures, and commerce were encouraged, and his land was one of the best governed in Europe. When Charles VI became insane (1392) the supreme control of affairs in France fell into the hands of Philip, and he used his power to strengthen his own line. He died at the château of Hal in Hainault, April 27, 1404. Consult Ernest Lavisse, *Histoire de France*, vol. iv, part i (Paris, 1902). See also **BURGUNDY**; **FLANDERS**; **FRANCE**.

PHILIP THE GOOD (1396-1467). Duke of Burgundy from 1410 to 1467. He was the son of John the Fearless and Margaret of Bavaria. He was born at Dijon, June 13, 1396, and on the assassination of his father, on the bridge of Montereau, he succeeded to the Duchy of Burgundy. Bent on avenging the murder of his father, he entered into an offensive and defensive alliance with Henry V of England, recognizing him as the rightful Regent of France and heir to the throne after Charles VI's death. This agreement was sanctioned by the imbecile King himself as well as by the mother of the Dauphin, Queen Isabella, in the Treaty of Troyes (1420). The Dauphin (later Charles VII), however, declined to resign his rights, and took to arms, but was defeated and driven beyond the Loire. Some disputes with the English concerning possessions in Brabant and elsewhere prompted Philip to threaten in 1429 to conclude a treaty with Charles VII. However, the English, by ceding to Philip the Province of Champagne and paying him a large sum of money, restored him to their side. In 1430 Holland, Hennegau, and Brabant were annexed to Burgundy. Though much more powerful

than his nominal superior, the King of France, Philip did not take the royal title. After the death of his wife, sister of the English Regent in France, the Duke of Bedford, he gradually drew nearer to Charles VII, and in 1435 tried to negotiate a peace at Arras between all parties in the Hundred Years' War. The English demands proving excessive, he made peace alone with the French King. The latter part of his reign was filled with trouble caused by the quarrels between Charles VII and his son, the Dauphin Louis, afterward Louis XI (q.v.), who had fled from his father's court and sought shelter with Philip. Philip died at Bruges, June 15, 1467, deeply lamented by his subjects. Under him Burgundy was the most wealthy, prosperous, and tranquil state in Europe; its ruler was the most feared and admired sovereign of his time, and his court far surpassed in brilliancy those of his contemporaries. He favored music, painting, and the arts in general, and knights and nobles from all parts of Europe flocked to his jousts and tournaments. In January, 1429/1430, in honor of his marriage with Isabella of Portugal, his third wife, he established the famous order of the Golden Fleece (q.v.). Consult: A. G. de Baranté, *Histoire des ducs de Bourgogne*, vols. iii-vi (2d ed., Brussels, 1834-40); Henri Pirenne, *Histoire de Belgique*, vol. ii (ib., 1902); *Cambridge Modern History*, vol. i (New York, 1902). See **CHARLES VII**.

PHILIP THE MAGNANIMOUS (1504-67). Landgrave of Hesse from 1509 to 1567. He was born on Nov. 13, 1504, and succeeded to the throne on the death of his father, William II, in 1509. In 1518 he was declared of age. At first he showed no sympathy for the Lutheran doctrines, of which he was to become the champion, and in 1523 he married the daughter of the Catholic Duke George of Saxony. In 1525, however, he was definitely won over to the cause of the Reformation. At the same time he aided in suppressing the Peasants' War. Philip became one of the chief leaders of the Reformation in Germany, and together with the Elector John of Saxony formed in 1526 the Protestant League of Gotha and Torgau. In 1529 he arranged the celebrated disputation between Luther and Zwingli at Marburg. It lasted for three days (October 1-3), but the two parties were unable to agree on the doctrine of the Eucharist. Philip himself, however, began to lean strongly towards the Swiss side. In 1531 he formed, together with the Elector of Saxony and other Protestant princes, the League of Schmalkald (q.v.). On March 4, 1540, Philip married a second time, though his first wife was still living. Luther and Melancthon had consented to his bigamy, and the revelation of this fact caused a great scandal. In the Schmalkald War, which broke out in 1546, Philip did his best for the Protestant cause, but the treachery of Maurice of Saxony, his son-in-law, who joined Charles V, made matters hopeless. At the battle of Mühlberg on April 24, 1547, Philip was made prisoner and placed in close confinement. He was liberated in 1552 by the action of Maurice, who deserted Charles and rejoined the Protestant cause. Philip died March 31, 1567, leaving four sons, among whom Hesse was divided. Consult Rommel, *Philipp der Grossmütige, Landgraf von Hessen* (Giessen, 1880); and Leopold von Ranke, *History of the Reformation in Germany*, translated by S. Austin (New York, 1905).

PHILIP THE MAGNANIMOUS, ORDER OF. A Hessian order of merit with five classes, founded by Grand Duke Ludwig II in 1840. The decoration is an eight-pointed cross of white enamel, with the motto *Si Deus nobiscum, quis contra nos*.

PHILISTINES, *fil-is'tinz* or *fil'is-tinz*; *Brit.*, usually, *fil'is-tinz* or *tinz* (Lat. *Philistini*, Heb. *Pelishtim*, Assy. *Palastu*, *Pilishtu*, Egypt. *Plst*). The name of a people who lived on the coast of the Mediterranean Sea, southwest of Judaea. According to Amos ix. 7 they were immigrants from Caphtor, and in Jer. xvii. 4 they are said to be "the remnant of the isle of Caphtor." Caphtor corresponds to the Egyptian Kptar, which is now generally identified with Crete. Concerning their life on Crete nothing is known with certainty. In view of the fact, however, that various systems of writing were in vogue on the island, it is highly probable that the Philistines brought with them a script which may have exercised an influence upon the formation of the North and South Semitic alphabets. (See ALPHABET.) The typical Philistine name Akaush (Ikausu, Achish) seems to have been in use among the Kaffo people before the Philistine invasion of Syria. The permanent settlement of this people in Canaan apparently took place in the reign of Ramses III (c.1200-1169 B.C.). At any rate, they are not mentioned before his time among the peoples of the sea in Egyptian inscriptions. The "land of the Philistines" is referred to in Gen. xxi. 32, 34, but in the body of the narrative Abimelech is called only "King of Gerar," so that the later designation of the country may be suspected of being an addition to the text. The Song of Moses, in which "the inhabitants of Philistia" are mentioned (Ex xv. 14), is generally held by scholars to be comparatively late, and the same applies to the allusion in Ex. xiii. 17 to "the way of the Philistines." Some of the cities which the Philistines afterward occupied meet us in Egyptian inscriptions of an earlier age and in the Tell el Amarna tablets, but their names are Semitic, and they were probably founded by the Avvites. (See CANAANITES.) The story of Shamgar ben Anath, who smote 600 Philistines with an ox goad, is scarcely sufficient as evidence of the presence of this people in Canaan before the battle on the Kishon; the Song of Deborah, which mentions Shamgar, says nothing concerning the Philistines. (See JEWS.) The blessing of Japheth by Noah (Gen ix. 27) seems to reveal a friendly feeling on the part of the Hebrews to the Cretan invaders of Palestine as still possible in the middle of the twelfth century (see JAPHETH), while the story of Samson is likely to reflect the attitude at a later time, when intermarriages were still common but racial hatred and border strife had begun to assert themselves. According to the Papyrus Golénischeff, the Thekel, companions of the Philistines in the raids of the time of Ramses III, were settled at Dor in the days of Ramses XII, where they were found by Wen Amon (c.1120 B.C.). In the following century the Philistines established themselves throughout the land which has been named Palestine after them. The battle of Aphek was a crushing defeat for Israel; their sacred palladium (see ARK OF THE COVENANT) was captured, and Philistine garrisons were placed in the conquered cities, including Beth Shean. The war of emancipation was begun by Saul and Jonathan, but they both

fell in the battle on Mount Gilboa (c.1023). David, who had taken part in the struggle for freedom, but had been forced to become the vassal of Achish (q.v.) of Gath, made himself King of the Negeb, a part of which was occupied by the Cherethites, or Cretans, Judah, and finally Israel, and confined the Philistines to the pentapolis composed of Gaza, Ashkelon, Ashdod, Ekron, and Gath. He had a bodyguard made up of Cherethites and Pelethites (q.v.), i.e., of Eteo-Cretans and Philistines. It is probable that Egypt participated in the reduction of Philistine power, as Gezer was captured by the Egyptian King (1 Kings ix. 16 b) and given to Solomon, and no Philistine city is included among the conquered towns in Shoshenq's list. The confederacy seems to have been broken up by this Egyptian conquest, and thenceforth each city appears to have pursued its own policy. According to 2 Chron. xi. 8 Rehoboam held possession of Gath. Nadab and Elah of Israel besieged Gibbethon (1 Kings xv. 27; xvi. 15). Hazael, King of Damascus, took Gath (2 Kings xii. 17), and Uzziah broke down the walls of Gath, Jabneh, and Ashdod (2 Chron. xxvi. 6). Ahaz suffered serious defeats at the hands of the Philistines. Hezekiah raided their country as far as Gaza. Mitinti of Ashkelon and Khanun of Gaza were vassals of Tiglath-pileser IV and took part in the revolt of 734-732. Khanun fled to Egypt, but returned and was defeated by Sargon II at Raphia (720 B.C.) Sargon deposed Azuri of Ashdod and set his brother Akhimiti on the throne. The latter was expelled by the party opposed to Assyria, who made Yawani king. Ashdod and Gath were captured by the Assyrians in 711 and many of the inhabitants deported. Zidka of Ashkelon, who ruled also over Joppa and other towns, took part in the revolt against Sennacherib in 701. He was carried to Assyria and Sharruludari was put into his place. Padi of Ekron, who was loyal to Assyria, had been sent by the war party as a prisoner to Hezekiah, the King of Judah was forced to deliver him up, and he was restored to his throne. Mitinti of Ashdod, Padi of Ekron, and Zilbel of Gaza are mentioned as Assyrian vassals by Esarhaddon and Asurbanipal. Psameticus I besieged Ashdod 29 years, probably 648-619 B.C.; and in 625 Ashkelon was taken by the Scythians and the temple of Aphrodite Urania, or Derketo, was spoiled. (Herodotus, i. 105.) Necho II took Gaza (c.608 B.C.), but was defeated on the Euphrates in 605 and lost Syria to Nebuchadnezzar. Gaza alone opposed Cambyses on his way to Egypt in 525. Herodotus found it not inferior to Sardes (iii. 5). It resisted Alexander two months in 332. After the battle of Ipsus (301) the Philistine cities remained in the hands of the Ptolemies until the battle of Panium (200), when the Seleucids gained possession of all Syria. Jonathan, the Hasmonæan, burned Ashdod with its great Dagon temple, and captured Ashkelon in 147. (1 Macc. x. 75 ff.) Alexander Balas gave him Ekron, and he later besieged Gaza. Simon took Joppa and Gezer, and Alexander Jannæus conquered Raphia, Anthedon, and Gaza in 96 B.C. Pompey delivered these cities from Jewish rule in 63 B.C. Mark Antony bestowed them on Cleopatra in 36 B.C., and Augustus gave Gaza, Anthedon, and Joppa to Herod in 30 B.C. Ashdod and Jamnia were given to Salome in 6 A.D. During the war with Rome (66-70) the Philistine cities suffered much from riots

created by the pagans or by the Jews. Especially Ashkelon and Gaza were flourishing centres of Hellenic civilization throughout the Roman and Byzantine periods.

The racial affinities of the Philistines are involved in the obscurity that still rests on the populations preceding the Greeks in the Aegean. Their physiognomy, dress, and arms are known from the pictorial representations of them by the Egyptians, and there is much similarity between them and other Mediterranean or Asiatic peoples. Like them, they did not practice circumcision, which was a marked characteristic of the Egyptians and the other peoples in Syria. Of their original language nothing is known; the name Achish and the title *seren*, from which *tyrannos*, *tyrannos*, may have come, furnish no clew. In Syria they adopted the speech of Canaan, and later this language yielded to the Aramaic, Greek, and Arabic. The Ashdodite speech differed from that of Jerusalem in the time of Nehemiah (xiii. 22), but it is not certain how far real dialectical distinctions are meant rather than mere differences of pronunciation. The Philistines were somewhat advanced in civilization when they came to Syria, had chariots of war, apparently used iron tools and weapons, probably had a system of writing, and possessed a marked capacity for political organization. They seem to have adopted the gods of the land, Dagon, Atar Ate (Derketo), and others, no doubt identifying them with their native deities. The racial stock, superimposed on the Canaanitish, was modified by intermarriages with the Hebrews and later by ethnic elements deported into the country by the Assyrians, by Macedonian and Greek settlers, and by Arabs, but undoubtedly retained some of its characteristics, probably even after the Moslem conquest. See Ashdon, ASHKELON, EKRON; GATH, GAZA.

PHILISTINISM. A term made popular in England and America by Matthew Arnold. The allusion is to the ancient Philistines, the enemies of the "children of light", hence Philistinism, in its modern application, means stolid opposition to the higher intelligence of the age, inaccessibility to ideas; plain, humdrum, respectable conventionalism. The German students first applied the term *Philister* to a townsman or to one who had not been trained in a university; it soon found a foothold in German literature, and reached England through Carlyle. The term has been used so indiscriminately by persons self-complacently wise in their own conceit that one may now

almost accept Leslie Stephen's definition of it as "a term of contempt applied by prize to the rest of their species." Consult Arnold, "Heine," in *Essays in Criticism*, 1st series (Oxford, 1885).

PHILISTUS (Lat., from Gk. Φίλιστος) (c. 435-c. 356 B.C.). A Greek historian of Syracuse. He assisted the elder Dionysius in securing and maintaining supreme power in Syracuse (c. 405 B.C.), but in 386 was banished for marrying a niece of the tyrant without the latter's consent. Recalled soon after the accession of Dionysius the younger, he brought about the banishment of Dion and Plato and, according to the latter, employed his talents in defense of the despotic policy of Dionysius. In 356 B.C., however, he was defeated in a naval battle by Dion and the revolted Syracusans, and either committed suicide or was killed by the populace. He left *Sicelica* (Σικελικά), a history of Sicily from the earliest times to 362 B.C., in 11 books, begun while he was in exile. According to the testimony of the ancients, by whom he is frequently mentioned, he sought in this work to palliate the despotic deeds of Dionysius, in order to secure his own return from exile. In style he was a close, though unsuccessful, imitator of Thucydides. The few extant fragments of Philistus are edited in C. Müller's *Fragmenta Historicorum Graecorum*, vol. i (Paris, 1841). Consult: E. A. Freeman, *History of Sicily*, vol. iv (Oxford, 1894); J. B. Bury, *The Ancient Greek Historians* (New York, 1909); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (6th ed., Munich, 1912).

PHILITAS. See PHILETAS.

PHILLE'O, MRS. PRUDENCE CRANDALL. See CRANDALL.

PHIL/LIMORE, JOHN SWINNERTON (1873-). An English classical scholar. He was educated at Westminster School and at Christ Church, Oxford; was lecturer at Christ Church in 1895 and tutor there in 1896-99; and at the University of Glasgow he was professor of Greek (1899-1906) and thereafter professor of humanity. In 1914-15 he held the Sather professorship of classics at the University of California. His publications include an edition of the text of Propertius, in the "Oxford Classical Texts Series" (1901); an Index Verborum to Propertius and a translation of that author (1906); *Poems* (1902); a text of the *Silvae* of Statius (1905); and a translation of *The Life of Apollonius of Tyana*, by Flavius Philostratus (2 vols., 1912).

PHILLIMORE, SIR ROBERT JOSEPH (1810-85). An English jurist, born in London. He was educated at Westminster School and at Christ Church, Oxford, where he graduated in 1831, and then became a clerk of the Board of Control. Soon afterward he was called to the bar, where he acquired a large practice, and was made a queen's counsel. In 1844 he became chancellor of the diocese of Chichester, and later was a member of Parliament. He was made judge of the Cinque Ports in 1855, Advocate General in Admiralty in 1862, when he was knighted, and in 1867 judge of the High Court of Admiralty and of the Arches Court of Canterbury. He was Judge-Advocate-General (1871-73), and was made Master of the Faculties in the latter year. On the reorganization of the judicial system of the Kingdom in 1875 he resigned his other offices and was appointed judge of the Admiralty and Probate Division of

the High Court of Justice, retiring in 1880. The most valuable of his numerous legal works is his *Commentaries upon International Law* (4 vols., 3d ed., London, 1879-89). Among his other writings are *Memoirs and Correspondence of George, Lord Lyttelton, 1734-73* (ib., 1845), and *The Ecclesiastical Law of the Church of England* (2d ed., ib., 1895), founded upon a work by Burn.

PHILLIMORE, SIR WALTER GEORGE FRANK (1846-). An English jurist, son of Sir Robert Joseph Phillimore, born in London. He was educated at Oxford, where he had a particularly distinguished career, became a barrister of the Middle Temple in 1868, and received the Patent of Precedence there in 1883. He stood high in ecclesiastical circles as vice president of the English Church Union and chancellor of the diocese of Lincoln. From 1897 to 1913 he was judge of the Queen's Bench Division of the High Court of Justice, and thereafter he served as a Lord of Appeal. He revised J. H. Blunt's *Book of Church Law* in 1873 and edited his father's *Ecclesiastical Law of the Church of England* and a third edition of volume iv of that author's *International Law*.

PHILLIP, JOHN (1817-67). A Scottish genre and portrait painter. He was born at Aberdeen, April 19, 1817. His boyhood was spent in poverty, but his remarkable talent attracted the attention of Lord Panmure, who enabled him to study at the Royal Academy. He at first painted Scottish genre subjects in the manner of David Wilkie, but a voyage to Spain in the summer of 1851-52, made for the benefit of his delicate health, completely changed his style. Influenced by Velazquez and by the bright colors of nature about him, he adopted the rich coloring, breadth, and vivacity by which his best works are distinguished. He received a number of royal commissions, among which was a large ceremonial picture, "The Marriage of the Princess Royal with the Crown Prince of Germany" (1860). He visited Spain in 1856-57 and again in 1860, his last visit being a time of great artistic activity. Among the best paintings of his early period are "Presbyterian Catechizing" (1847) and "Baptism in Scotland" (1850). After his visit to Spain he executed "The Spanish Gypsy Mother" (1853), the "Letter-Writer of Seville," and the "Dying Contrabandista" (1858), all in the royal collection. Other important works are: the "Prison Window" (1857) and "The Promise," both in the Tate Gallery; "La Bomba" (1862-63); "Il Cigarello: A Chat around the Braserio" (Guildhall); and his masterpiece, "La Gloria" (1864), in the National Gallery of Scotland. In the Metropolitan Museum, New York, is his "Gossips at the Well." He produced also a number of forceful portraits, including those of Sir J. E. Millais (1843), the Prince Consort (1858), Miss Caird (1866), and Mr. W. B. Johnston and his wife, National Gallery, Edinburgh. See Plate of FARADAY, MICHAEL.

PHILLIPPS, JAMES ORCHARD HALLIWELL. See HALLIWELL-PHILLIPPS, J. O.

PHILLIPS. The name of a family identified with the founding of Phillips Academy (q.v.).—**SAMUEL, JR.** (1751-1802), politician and philanthropist, was born at Andover, Mass. He was graduated at Harvard in 1771 and was elected in 1775 to the Provincial Congress, of which

he continued to be a member until 1780, when he was elected a member of the Massachusetts State Senate, of which for 17 years (1785-1802) he was presiding officer. From 1781 until 1798 he was also judge of the Court of Common Pleas for Essex County, and in 1801 he was elected Lieutenant Governor by the Federalists (q.v.). He is best known, however, as the founder of Phillips Academy at Andover in 1778. In this project he interested his father, **SAMUEL** (1715-90), who was graduated at Harvard in 1734 and who afterward represented Andover in the General Court; his uncles, **JOHN** (1719-95), who graduated at Harvard in 1735, settled at Exeter and was for many years a member of the Council of New Hampshire, and **WILLIAM** (1722-1804), who held important political offices in Massachusetts; and the son of the last named, **WILLIAM, JR.** (1750-1827), who was in 12 successive elections chosen Lieutenant Governor of Massachusetts. Their liberality enabled the academy to take a high position from the day of its opening. A few years later John Phillips, who was childless, founded at Exeter a similar academy, to which at his death he bequeathed two-thirds of his estate, the remaining third going to Phillips Academy at Andover. During his lifetime he also endowed a professorship at Dartmouth College and made liberal gifts to Princeton.

PHILLIPS, DAVID GRAHAM (1867-1911). An American novelist, born in Madison, Ind. After his graduation from Princeton University in 1887 he turned to journalism, at first in Cincinnati and later in New York, where he was reporter on the *Sun*. This position he gave up to assume the duties of London correspondent for the *New York World*, and to work for a time as Joseph Pulitzer's private secretary. On his return to America he worked editorially and miscellaneously for the *World*. His first published novel was *The Great God Success* (1901), which brought to an end his newspaper work and opened a rather prolific career as a novelist, a career cut short by the shot of a mad assassin, Jan. 24, 1911. If not a novelist of the first order, there was talent in Phillips's books, which generally addressed themselves to pressing ethical and social problems of the day; they were thought-provoking and, to a considerable audience, highly interesting. *The Husband's Story* (1910) is representative of this author at his best; he may also be read to great advantage in *The Second Generation* (1907); *Old Wives for New* (1908); *The Hungry Heart* (1909). Other books of his are *Her Serene Highness* (1902); *Golden Fleece* (1903); *The Social Secretary* (1905); *The Fortune Hunter* (1906); *Light-Fingered Gentry* (1907); *The Worth of a Woman* (1908); *The Grain of Dust* (1911). Consult F. T. Cooper, *Some American Story-Tellers* (New York, 1911), and J. C. Underwood, *Literature and Insurgency* (ib., 1914).

PHILLIPS, EDWARD (1830-c.96). An English compiler, the biographer of his uncle, John Milton. The poet's elder and only sister, Ann, on her second marriage left her two sons by her first to the care of her brother, who took them to his house in Aldersgate Street. Edward was then 10 years old, his brother John a year younger, and besides his nephews Milton took in other pupils. Edward ceased studying with him in 1846 and two years afterward went to Oxford, where he departed from his Puritan training

and joined himself to the Cavalier party. Edward expressed his royalist sentiments in *The Mysteries of Love and Eloquence*, etc. (1658), containing certain verses that are not original, and to record the Restoration he wrote a *Continuation* (1665) to Barker's *Chronicle of the Kings of England*, which had stopped at 1641. He edited the poems of Drummond of Hawthornden (1656), compiled a dictionary (1658), and was tutor in more than one noble household, but was often obliged to support himself and his family by making compilations and translations. John Phillips never became reconciled to his uncle, but Edward did. He was the first to praise *Paradise Lost* in the press, spoke in the highest terms of its author in his *Theatrum Poetarum* (1675), and wrote the scant but appreciative *Life of Milton* which was prefixed to the *Letters of State* (1694).

PHILLIPS, JOHN (1676-1709). See **PHILLIPS, JOHN**.

PHILLIPS, JOHN (1800-74). An English geologist, born in Wiltshire. After receiving an elementary education he joined his uncle, William Smith, in geological investigations in various parts of England. In 1825 he received the curatorship of the Yorkshire Philosophical Society, and in 1834 became professor of geology at King's College, London. Resigning this office in 1840, he served successively as geologist on the survey of Great Britain, professor of geology at Trinity College, Dublin, and at Oxford, and as keeper of the Ashmolean Museum. He was president of the Geological Society in 1859-60. He contributed numerous papers to scientific journals and wrote also the following separate works: *Illustrative of the Geology of Yorkshire* (1822-36); *Guide to Geology* (1834); *Treatise on Geology* (1837); *Geological Map of the British Isles* (1842); *Memoirs of William Smith* (1844); *Vesuvius* (1869); *The Geology of Oxford and the Valley of the Thames* (1871).

PHILLIPS, JOHN ARTHUR (1822-87). An English geologist, born at Polgooth, near St Austell, Cornwall, and educated at the Paris School of Mines. He received the appointment of chemist to the Admiralty commission engaged in finding the most suitable coal for burning at sea, and afterward made valuable researches in mineralogy. He inspected gold mines in California and elsewhere, and between 1875 and 1878 wrote a series of important monographs on the rocks of his native country. He published *The Mining and Metallurgy of Gold and Silver* (1867) and *The Elements of Metallurgy* (1874), but his chief work was *A Treatise on Ore Deposits* (1884).

PHILLIPS, PHILIP (1834-95). A Methodist evangelist and singer. He was born in Chautauqua Co., N. Y. After the age of 19 he devoted all his time to the study and use of music. During the Civil War he sang much for the benefit of the Christian Commission; he became musical editor for the Methodist Book Concern in 1866, and made a musical tour around the world in 1872, holding evenings of song in all lands. On his return he gave 200 nights for the Sunday-school Union in England; subsequently he traveled with D. L. Moody, the evangelist. He produced a number of hymn books, such as *Early Blossoms* (1860); *The Singing Pilgrim* (1866); *American Sacred Songster*, prepared for the British Sunday-school Union (1868); *Hallowed Songs* (1871); *Our New Hymnal* (1894); and, with his son, *Bright*

Gems (1895). Several of these collections had a very large sale.

PHILLIPS, STEPHEN (1868-1915). An English poet, born at Somertown, near Oxford, July 28, 1868. Having attended the grammar schools at Stratford-on-Avon and at Peterborough, where his father was precentor of the cathedral, Phillips studied for the civil service, but entered Queens' College, Cambridge, in 1886. At the end of the first term he joined F. R. Benson's company of Shakespearean players, with whom he remained six years, traveling through the country and also playing at the Globe Theatre in London. Among his parts were Iago, the Ghost in *Hamlet*, Prospero, Brutus, and Sir Andrew Aguecheek. Leaving the stage, he became a lecturer on English history in Wolfgram and Needham's classes for army candidates, but soon adopted literature as a profession. In June, 1890, with three other authors, he published in London a booklet of verse entitled *Primavera*. In 1894 followed *Eremus*, which won the praise of Symonds, Jowett, and Stopford Brooke. *Christ in Hades, and Other Poems* (1896; 4th ed., with additions, 1897) and *Poems* (1897), containing "Marpessa," secured for the author a very high rank among poets of his time. The *Poems* won from the London Academy the award of 100 guineas for the best verse of the year. Commissioned by George Alexander to write a verse tragedy for St. James's Theatre, Phillips composed *Paolo and Francesca* (1899). The blank verse of this lyric tragedy recalls the Elizabethans, but its simple structure is more nearly akin to the French classic drama. For Beerbohm Tree Phillips wrote his second play, *Herod* (1900), a tragedy. *Ulysses*, a dramatic poem, appeared in 1902, *The Sin of David* in 1904, *Nero* in 1906. Subsequently were published: *The Last Heir* (1908); *Pietro of Siena* (1910); *The King* (1912); *Iole* (1913); *Lyrics and Dramas* (1913); *Panama and Other Poems* (1915); *Armageddon* (1915), a war play. Consult: William Archer, *Poets of the Younger Generation* (New York, 1902); id., *Real Conversations* (London, 1904); E. E. Hale, Jr., *Dramatists of To-day* (6th ed., New York, 1911).

PHILLIPS, THOMAS (1770-1845). An English portrait and historical painter, born at Dudley, Warwickshire. He was a pupil of Francis Eginton, a glass painter of Birmingham, and afterward worked under Benjamin West on the windows of St. George's Chapel, Windsor. He began to exhibit landscapes and historical paintings at the Royal Academy in 1792 and was elected to that institution in 1808. There he succeeded Fuseli as professor of painting, and his *Lectures on the History and Principles of Painting* were published in 1833. After 1796 he devoted himself chiefly to painting portraits. Among his distinguished sitters were the Prince of Wales, William Blake (in the National Portrait Gallery), Napoleon (at Petworth), Lord Byron (two portraits), and many other celebrities of the time.

PHILLIPS, THOMAS W. (1835-1912). An American capitalist and Congressman, born at Mount Jackson, Pa. He became one of the largest individual petroleum producers in the United States and was active in philanthropic work. Becoming interested in politics, he originated the campaign textbook, first used in the Garfield campaign of 1880. He served in the Fifty-third and Fifty-fourth Congresses (1893-

97) and introduced the bill that created the Industrial Commission, of which he became a member. In 1902 Phillips made a supplementary report to that of the commission, this report attracting attention so widespread that it led to the creation of the Bureau of Corporations.

PHILLIPS, WALTER ALISON (1864-). An English historian, educated at Merton College, Oxford. He was chief assistant editor and history departmental editor on the eleventh edition of the *Encyclopædia Britannica*, special correspondent of the *London Times* in South America in 1912, and editor of the *Times's* South American supplement in 1913. In 1914 he became Lecky professor of modern history at Trinity College, Dublin. He wrote on the early years of nineteenth-century history, especially diplomatic: *The War of Greek Independence* (1897); *Modern Europe 1815-1899* (1901); *George Canning* (1902); *The Confederation of Europe* (1914).

PHILLIPS, WENDELL (1811-84). An eminent American orator and reformer, born in Boston. He was educated at Harvard, graduating in 1831, the year of the first appearance of the *Liberator*. After a three years' course at the Cambridge Law School he was admitted to the Suffolk County bar, but he was little interested in professional eminence. On Oct. 21, 1835, from his office window he indignantly saw Garrison dragged at a rope's end by a respectable mob, in 1836 he joined the Abolitionists, and thereafter was occasionally heard at meetings of the American Anti-Slavery Society. He came at once into prominence by his Faneuil Hall speech of Dec. 8, 1837. At the instance of Dr. W. E. Channing a public assembly had convened to protest in a suitable manner against the murder of the Rev. E. P. Lovejoy (q.v.) at Alton, Ill. This purpose seemed likely to be defeated by J. T. Austin, Attorney-General of Massachusetts, who commended the Alton rioters and affirmed that Lovejoy "died as the fool dieth." To this Phillips made a brilliant and crushing reply, whose eloquence he never surpassed, and which has been ranked by Curtis with Henry's oration at Williamsburg and Lincoln's Gettysburg address. From that time he was an antislavery leader, preeminently the orator of the movement. In 1839 he withdrew from the practice of law through scruples against compliance with the attorney's oath to the Constitution, and later he refused to stand for a Congress which he could not enter without swearing allegiance to that same Constitution. He called for the immediate and complete abolition of slavery, declared the Church *particeps criminis* for its attempt to justify slavery by the Scriptures, opposed colonization for the negro, discontinued voting, and regarded disunion as the best means for accomplishing emancipation. He was not, however, like Garrison, a nonresistant. In the Abolitionist divisions of 1839-40 he with Garrison opposed the organization of the Abolitionists into a political party and the attempt to bar any from the antislavery platform on the ground of religious beliefs. In 1840 he was the representative of the Massachusetts Abolitionists at the London World's Antislavery Convention. Differences arose between himself and Garrison in 1864 in regard to Lincoln's reelection, which he did not favor; and in 1865 these differences were renewed when he advocated and Garrison opposed

the continuance of the Antislavery Society. His contention was that the work of the society was not finished until the negro obtained the suffrage. As a result he was elected, in Garrison's stead, (1865) to the presidency of the society, which was dissolved in April, 1870, on the passing of the Fifteenth Amendment. Phillips was prominently active in the various controversies of the Reconstruction. He spoke in behalf of Ireland, of Crete, of the Indian, prison reform, also of the abolition of capital punishment, prohibitory legislation regulating the sale of liquor, the greenback theory, and in connection with the labor question urged that vast combinations of capital with unlimited monopolies and powers tend to make the rich richer and the poor poorer. In 1870 he received about 20,000 ballots as labor reform and temperance candidate for the governorship of Massachusetts.

Phillips must be compared among American orators to Everett, Clay, and Webster; and his achievement is, perhaps, to be reckoned greater than that of any of these when it is considered that, whereas they represented a strong political organization or powerful conservative opinion, he attacked existing prejudices and institutions, for years spoke to hostile audiences, was denounced by the two great parties and belonged to none. His manner was that of "simple colloquy," so that Greeley said Phillips made one think it easy to be an orator. His voice was in the baritone register, used largely in what elocutionists call the upper chest notes, and remarkable not so much for its compass, volume, or intensity as for its timbre. In gesture or general action he was sparing. He seldom employed the dramatic mode of expression. But in invective or epigram he was unsurpassed, he possessed wit, which most other notable American orators have lacked, and he told an anecdote with much skill. Phillips was not a scholar in the restricted sense, for this the demands made upon his time as a public speaker did not permit. But his reading was considerable, and he could always find illustrative material in the one subject he was accustomed to say he knew thoroughly, the great English Revolution. In addition to his antislavery and other reform speeches, he appeared in various lyceum addresses, the most noteworthy of which are *The Lost Arts*, *Toussaint l'Ouverture*, and *Daniel O'Connell*, and in 1881 he made a distinguished oration on *The Scholar in a Republic* at the centennial anniversary of the Phi Beta Kappa of Harvard. During antislavery days he always offered to speak without remuneration and to pay his expenses if he might use antislavery for a literary subject. He wrote for the *Liberator* and the *Antislavery Standard* and published a number of pamphlets, including *The Constitution a Proslavery Compact* (1844); *Can Abolitionists Vote or Take Office under the United States Constitution?* (1845); *Review of Spooner's Unconstitutionality of Slavery* (1847); *Review of Webster's Seventh-of-March Speech* (1850); *Review of Kosciuszko's Course* (1851); *Defense of the Antislavery Movement* (1853). Collections of *Speeches, Lectures, and Letters* have appeared at Boston, the first series, edited by James Redpath, in 1864, the second by T. C. Pease in 1892. These are edited from the best stenographic reports. Consult: W. C. Martin, *Wendell Phillips, the Agitator*, in "American Re-

formers" (New York, 1890); G. L. Austin, *Life and Times of Wendell Phillips* (new ed., Boston, 1893); Lorenzo Sears, *Wendell Phillips* (New York, 1909); C. E. Russell, *The Story of Wendell Phillips, Soldier of the Common Good* (Chicago, 1914); also works dealing with the antislavery struggle.

PHILLIPS, WILLIAM (1775-1828). An English mineralogist, born in London. He was one of the founders of the Geological Society of London in 1807, and became a fellow of the Royal Society in 1827. His writings on mineralogy and geology were the standard textbooks of his day. These included: *Outlines of Mineralogy and Geology* (1815; 4th ed., 1826); *Elementary Introduction to the Knowledge of Mineralogy* (1816; 3d ed., 1823); *A Selection of Facts from the Best Authorities, Arranged so as to Form an Outline of the Geology of England and Wales* (1818), which was made the basis of a joint work by W. D. Conybeare and Phillips under the title *Outlines of the Geology of England and Wales* (1822).

PHILLIPS ACADEMY, ANDOVER. A boys' school at Andover, Mass., commonly known as **PHILLIPS ANDOVER**. It was founded and opened in 1778 through the gifts of members of the Phillips family. The school was incorporated in 1780, and in 1807 the trustees were empowered to receive and hold funds for a separate theological institution, and the Andover Theological Seminary was accordingly established in the following year. In 1830 the Teachers' Seminary was established in anticipation of the normal schools, but in 1842 it was merged in the parent academy and is its present scientific department. In 1901 an archaeological department, with valuable collections and an endowment for instruction, research, and publication, was established by two anonymous donors. The academy, with its sister institution at Exeter, has always been regarded as a typically democratic American school. During the early years of its history it had as students many of the famous men of the country. The equipment has in recent years been largely increased by new buildings, among them several dormitories and a gymnasium. The standards of Yale and Harvard, to which most of the graduates go, form the basis on which the work of the school is arranged. The academy had in 1915 an attendance of 558 and 40 instructors. The endowment was \$1,460,000, and the academy property was estimated at \$1,903,450. The library contained 8674 volumes. In 1915 the president was Alfred Lawrence Ripley, A.M.

PHILLIPSASTRÆA. A genus of fossil corals found in the Devonian and Carboniferous rocks of America and Europe. They have large colonies of corallites united by confluent septa and are objects of great beauty, especially when polished.

PHILLIPSBURG. A town in Warren Co., N. J., on the Delaware River, opposite Easton, Pa., and on the Pennsylvania, the Lehigh Valley, the Lehigh and Hudson River, the Lackawanna, and the Central of New Jersey railroads (Map: New Jersey, B 2). It possesses valuable advantages for an industrial centre, the river affording good water power and the railroads making accessible a supply of coal and iron ore. Its manufacturing interests are extensive and include shops of three of the railroads that enter the town, also iron fur-

naces, sheet-iron mills, foundries and machine shops, stove works, boiler works, horseshoe mills, drill works, and large silk mills. Settled in 1749, Phillipsburg was incorporated in 1861, and adopted the commission form of government in 1914. Two street-car lines are owned by the city. Pop., 1900, 10,052; 1910, 12,803; 1915 (State census), 15,430.

PHILLIPS EXETER ACADEMY. One of the oldest boys' schools in the United States, founded at Exeter in 1781 and opened for students in 1783. It is commonly known as **PHILLIPS EXETER**. The school was the first educational institution incorporated by the Legislature of New Hampshire and takes its name from John Phillips, its founder, who was also a generous benefactor of Dartmouth College and of Phillips Academy (q.v.), Andover, Mass. The school early gained a national reputation, which it has always retained. It draws students from all parts of the country. The alumni in 1915 numbered nearly 10,000. Among the earlier graduates were Daniel Webster, George Bancroft, Edward Everett, John A. Dix, and Jared Sparks. There were enrolled in 1914-15 573 students, and the faculty numbered 32. The school buildings include well-equipped laboratories, fine dormitories, an administration building, a gymnasium, a library, an infirmary, a boathouse, a dining hall, and a graduates' house, designed for the entertainment of visiting alumni and other friends. The buildings with their equipments are valued at about \$1,000,000, and the endowment exceeds \$500,000. The recreation grounds, 300 acres or more, are of unusual extent and beauty.

PHILLIPSIA. A genus of trilobites that attained its maximum development in the Lower Carboniferous but continued down to Permian time, when it was represented by the last-surviving species of the trilobites. It resembles *Proetus*, but has a more prominent glabella and a larger, more segmented pygidium. See **TRILOBITES**.

PHILLIPOTS, EDEN (1862-). An English novelist, son of Capt. Henry Phillipots. He was born at Mount Abou in India, Nov. 4, 1862, and was educated at Plymouth, England. At the age of 18 he became clerk in the Sun Fire Insurance office, a position which he held for 10 years. A number of earlier novels were followed by two considerable successes, *Lying Prophets* (1896) and *Children of the Mist* (1898). In these novels Phillipots depicted Devonshire life with remarkable power and beauty. In their coloring they recall Blackmore and in their tragedy they are akin to Hardy. These successes were followed by *The Human Boy* (1899); *Sons of the Morning* (1900); *The Striking Hours* (1901); *The Good Red Earth* (1901); *The River* (1902); *The Secret Woman* (1905); *The Portreeve* (1906); *The Haven* (1909); *The Dance of the Months* (1911); *The Forest on the Hill* (1912); *The Joy of Youth* (1913); *Brunel's Tower* (1915); three plays in *Modern Plays* (1914); *Old Delabole* (1915); and a volume on gardening, *My Shrubs* (1915).

PHILLIPOTS, HENRY (1778-1869). An English bishop, born at Bridgewater, Somerset. He was graduated B.A. at Corpus Christi College, Oxford, in 1795, and M.A. at Magdalen College in 1798. From 1806 to 1826 he was one of the chaplains of Shute Barrington, Bishop of Durham. In 1825 he engaged in a notable controversy with Charles Butler, in

which he opposed removing the political disabilities from Roman Catholics. From 1830 until his death he served as Bishop of Exeter, and in that capacity was involved in several famous lawsuits with his clergy over ecclesiastical matters.

PHILO. See **PHILO JUDEUS.**

PHILOBIBLON. A prose treatise in praise of books and learning by Richard Aungerville, known as Richard de Bury, Bishop of Durham (1345). It was printed first at Cologne in 1443, at Paris in 1500, and at Oxford in 1599. The latest English translation is that of E. C. Thomas (London, 1885).

PHILO BYBLIUS. See **SANCHUNIATHON**.

PHILOCHORUS (Lat., from Gk. Φιλόχορος). A Greek historian who is said to have lived at Athens between 306 and 260 B.C. According to Suidas he was one of the bitterest opponents of Demetrius Poliorcetes and of his son, Antigonus Gonatas, and was put to death by the latter after the conquest of Athens (c.260 B.C.). He is known chiefly by his *Atthis*, a history of Athens from the earliest times to 262 B.C., in 17 books. Important fragments are preserved in Müller's *Fragmenta Historicorum Græcorum* (Paris, 1841). Consult: Julius Strenge, *Quæstiones Philochoræ* (Göttingen, 1868); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (6th ed., Munich, 1911); also the edition of Philochorus by M. C. G. Siebelis (Leipzig, 1811).

PHILOCTETES (Lat., from Gk. Φιλοκτήτης, *Philoktētēs*). A Greek chieftain who inherited the bow and arrows of Heracles. He started with seven ships for the Trojan War, but was bitten on the way by a serpent at Lemnos. On account of the stench of the wound the other Greeks left him behind and went on to Troy. As an oracle, however, declared that Troy could be taken only by the arrows of Heracles, Odysseus and Diomedes went to Lemnos to fetch Philoctetes. He accompanied them to Troy, was healed by Machaon, slew Paris, and returned safely home. The drama *Philoctetes* by Sophocles is still extant. The legend was dramatized also by Æschylus and Euripides.

PHILODEMUS (Lat., from Gk. Φιλόδημος). An Epicurean philosopher of the first century B.C., born at Gadara in Syria. Besides 34 epigrams, mostly erotic, preserved in the Greek anthology, Philodemus wrote works on philosophy; treatises ascribed to him, much mutilated, were discovered at Herculaneum. Among these are: *De Rhetorica*, edited by Gros (1840) and by Sudhaus (1892-95); *De Musica*, edited by Kempke (1884); *De Vitius*, edited by Götting (1830) and Ussing (1868); *De Ira* and *De Pietate*, edited by Gomperz (1864-66); *De Morte*, edited by Mekler (1886). Martha makes him the editor of Lucretius, and many attempts have been made to prove that Cicero got his knowledge of Epicureanism from Philodemus and so from Zeno. Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (6th ed., Munich, 1911).

PHILODENDRON. See **PLATE** of **EPHYTES**.

PHILO JUDEUS (Lat., from Gk. Φίλων Ἰουδαῖος, *Philōn Ioudaios*, Philo the Jew). A Jewish-Hellenistic philosopher, born at Alexandria about 25 B.C. He belonged to one of the most wealthy and aristocratic families—his brother Alexander was the alabarch or president of the Jewish colony at Alexandria—and

he received the most careful Jewish education, consisting largely of a study of the Old Testament in the Septuagint version. He became acquainted with the writings of the Greek philosophers also. He went to Rome, 39 or 40 A.D., as the advocate of his Alexandrian brethren, who had refused to worship Caligula in obedience to the Imperial edict. He has left an account of this embassy, the result of which was not satisfactory. Of his life we know little except what is recorded above.

While strict in all that pertained to ceremonial and ritual, in doctrinal matters Philo was a bold allegorizer. A literal interpretation of the Scriptures he regarded as superstitious and mean. Especially did he explain away all theophanies recorded in the Old Testament, as told in accommodation to the sensuous character of human minds, which needed anthropomorphic representations of supersensible truth.

His writings develop his ideas and his system in the two directions indicated. In that division of his writings principally which treats of the creation (*Κοσμοποια*), he allows allegory to take the reins out of his hands; in that on the laws (*Νομοί*), on the other hand, he remains remarkably sober and clear, extolling the Mosaic legislation throughout, at the expense of every other known to him. In a very few instances only he is induced to find fault, or to alter slightly, by way of allegory, the existing ordinances.

His idea of God is a preëminently theosophic, not a philosophic one. God alone is the real good, the perfect, only to be imagined as the primeval light, which cannot be seen by itself, but may be known from its rays, that fill the whole world. He has no attributes and therefore no name, and reveals himself only in designations expressive of this inexpressibility. He is better than virtue and knowledge, better than the beautiful and the good (*Kalokagathia*), simpler than the one, more blissful than bliss. He is the existing unity or existence itself, self-sufficient, free from pain and fear and participation in evils, and full of happiness. Dynamically God is omnipresent, but not really. Indeed, so far is God really from filling the world with his presence that the world, on the contrary, finds its place in God. And yet the God who comprehends within himself the material universe is so exalted above the world and so remote from it that a point of contact cannot be found between them; hence the need of an intermediate class of beings to stand between them. These were found in the spiritual world of ideas, which are not only ideals, or types, in the Platonic sense, but real, active powers, surrounding God like a number of attendant beings. They are his messengers, who work his will, and by the Greeks are called good demons; by Moses, angels. There are very many different degrees of perfection among them. Some are immediate serving angels; others are the souls of the pious, of the prophets and the people of Israel, who rise higher up to the deity; others again are the heads and chief representatives of the different nations, such as Israel does not need. The Logos comprises all these intermediate spiritual powers in his own essence. (See **LOGOS** for Philo's views on this part of his system.) Man is a microcosm, a little world in himself, a creation of the Logos, through whom he participates in the deity. Philo identified the ethical principles of Stoicism with

the Mosaic ethics, in which the ideal is most exalted moral perfectibility or sanctity, and man's duties consist in veneration of God and love and righteousness towards fellow men. Philo holds firmly the belief in immortality. Man is immortal by his heavenly nature; but as there are degrees in his divine nature, so there are degrees in his immortality, which then deserves this name only when it has been acquired by an eminence of virtue. There is a vast difference between the mere living after death, which is common to all mankind, and the future existence of the perfect ones. Virtue and sin both have all their rewards within themselves; but the soul, which is preëxisting, having finished its course in the sublunary world, carries the consciousness with it in a more intense and exalted manner. Paradise is oneness with God; there is no hell with bodily punishments for souls without a body, and no devil in the Philonic system. (For the relation between Philo as the representative of the Judeo-Alexandrian philosophy and other contemporary philosophic tendencies, see NEO-PLATONISM.) Of the many works left under his name, several have been declared spurious, but in some cases without much show of reason. His writings have been published by Richter (Leipzig, 1828-30) and by Tauchnitz (ib., 1851-54). The latest edition appeared under the editorship of Cohn and Wendland (Berlin, 1896-1906).

PHILOLAUS (Lat., from Gk. Φιλόλαος) (c.450 B.C.). A Pythagorean philosopher, born at Tarentum or Croton. Little is known of his life. Some fragmentary writings are attributed to him, in which he sets forth the teachings of Pythagoras. The authenticity of these writings has been the subject of serious study and of dispute among critics. To him is ascribed a knowledge of harmonic ratio and of the fact that the number of vertices of a cube is an harmonic mean between the number of faces and the number of edges. He seems also to have known with reasonable exactness the periods of revolution of the planets. Consult Boeckh, *Philolaus, des Pythagoræers Lehren, nebst den Bruchstücken seines Werkes* (Berlin, 1819), and Schaar-schmidt, *Die angebliche Schriftstellerei des Philolaus* (Bonn, 1864).

PHILOLOGICAL ASSOCIATION, AMERICAN. A learned society, organized at Poughkeepsie, N. Y., in July, 1869, from the classical section of the Oriental Society (q.v.), with Prof. William D. Whitney, of Yale, as the first president. Its object is the advancement and diffusion of philological knowledge. It has a membership of about 700, and its annual meetings are held in such cities as the society may select from year to year. The publications of the associa-

tion are annual volumes of *Transactions*, in which are printed in full such papers as the executive committee may select from year to year, and *Proceedings*, giving an account of the annual meeting and brief abstracts of other papers presented to the society.

PHILOLOGICAL SOCIETY, BRITISH. A learned society, founded in London in 1842 to investigate and promote the study and knowledge of the structure, the affinities, and the history of languages. It added to these objects the publication of the New English Dictionary, work upon which was begun in 1857, under the editorial charge of Dr. James A. H. Murray, assisted by many scholars and men of science in Great Britain and the United States. The first volume was published in 1888, and the bound volumes issued to 1914 bring the dictionary down to SH, though parts as far as TU have also been sent out in pamphlet form (July, 1915). The society has its headquarters at University College, London, and holds its annual meeting in May and monthly meetings from November to June, at which papers are read, the more important ones being afterward published in volumes of *Transactions*, distributed to members without charge, while summaries or synopses of the other papers are printed in the monthly *Abstract*, also published by the society.

PHILOLOGY (Lat. *philologia*, from Gk. φιλολογία, love of literature and learning, love of language and history, from φίλος, *philos*, dear + λόγος, *logos*, word). In modern English usage, the science of comparative linguistics. As speech may be studied either in its expression or in its origin, philology may occupy itself with linguistic expression, with literature, or with the genesis and laws of language. French and German scholars usually employ the word in the former sense, and many English scholars prefer to understand by philology the study of literary expression, even including all that is revealed through literature. Nevertheless, although this is perhaps the more legitimate use of the word, yet the tendency of the day, even among French scholars, and still more among English-speaking people, is to confine philology to the study of language and to divide this study into (a) linguistics proper, including phonetics, and (b) comparative philology, the study of language by a comparison of different languages in the same family. Languages may be divided roughly, and merely for convenience without scientific accuracy, into several types. Of these the most important are the isolating or monosyllabic, the agglutinative, with its subdivision the incorporating or synthetic, the inflectional, and the analytic. The isolating group, formerly supposed to be represented by Chinese, is characterized by invariable monosyllabic roots. The opinion which once considered this group to be the most primitive is now rejected by many who hold that the type represents, on the contrary, the culmination of a long linguistic evolution. The agglutinative type, which includes the majority of languages, such as the Dravidian, Malayo-Polynesian (qq.v.), Ural-Altaic (q.v.; see also FINNISH LANGUAGE), and African (q.v.), is marked by the addition of prefixes, suffixes, and infixes to the so-called root (q.v.) or base. These additions have, at least at first, distinct meanings of their own, but in course of time the meanings become obscured, the particles themselves become fused in signification with the base and lose their individuality. The result

is the type of language called inflectional. (See INFLECTION.) In the incorporating or polysynthetic languages, represented by the American Indian groups, the verb absorbs the noun, pronouns, adjectives, and adverbs, thus marking a higher degree of agglutination than the agglutinative languages themselves. The analytic languages are a development of the inflectional. In time the inflections tend to become weakened in force and to require the help of pronouns, prepositions, and auxiliary verbs. When the inflections have in the main disappeared and their places have been taken by individual words, the language is termed analytic. To this group belong such languages as English, French, Italian, Spanish, Persian, and Hindustani, as distinguished from the inflectional groups represented by the Semitic and Indo-European families, which include Hebrew, Arabic, Sanskrit, Greek, Latin, and German. It is, however, customary to confine comparative philology to the study of the group of Indo-European languages, though there is no reason why the term should not be applied to any other group as well. The different aspects of philology thus outlined are treated under different heads, to which the reader is referred for special discussion. See the articles ON LANGUAGE, for the psychology of language; ALBANIAN, ARMENIAN, CELTIC, INDO-IRANIAN, ETC., for special branches; and for classical philology, see the articles on GREEK LANGUAGE and ITALIC LANGUAGES.

History of Comparative Philology. Until the discovery of Sanskrit no comparative philology was possible. The French Jesuit Cœurdoux in 1767, Sir William Jones (q.v.) in 1786, and Schlegel in 1808 connected Sanskrit with Greek and Latin; but Franz Bopp (q.v.) first correlated the facts observed by others and founded the science. Approaching the subject from the philosophical side, Bopp devoted himself to glottogenic problems, his chief aim being to discover phonetic laws and the genesis of forms. He was at first influenced by Friedrich Schlegel (q.v.), and opposed the doctrine of mechanical affixes (called agglutination), holding rather to an inner inflection as the index of different relations, though he admitted into the root (in the aorist, etc.) the abstract verb *as*, *be*. But this view (1816) was soon changed, and Bopp in 1819 himself opposed this philosophy of language and taught that verbal endings, *-ti*, e.g., are really pronominal in origin. In his *Conjugations-system and Vergleichende Grammatik* (1833-52) he went still further, assuming a pronominal origin for case endings as well as verbal endings (*-s* of the nominative being *sa*, *he*, etc.). At one stroke, so to speak, Bopp formulated the method of historical explanation which was destined henceforth to take the place of the eighteenth-century theory of logical conceptions. Not only did this eminent philologist foresee the greater part of the comparisons of grammatical forms that can be made, but it is noteworthy also that not a single language of the Indo-European family escaped his attention. His mistakes consist principally in his neglect of the study of phonetic evolution as well as of the use of forms and the structure of the sentence. Bopp's monumental work was followed by the equally important *Geschichte der deutschen Sprache* (1819-48) of Jakob Grimm (q.v.), who with Rask (q.v.) extended the comparison of forms and discovered phonetic laws of change.

(See below.) Rask's work is more scientific and modern than that of Bopp, because he limited himself to showing the original identity of the languages compared without wasting any time in vain attempts to explain primitive forms. After Grimm the *Etymologische Forschungen* (1833-36) of Pott (q.v.) established a rationalized system of etymology for the whole group of Indo-European languages. Bopp, Grimm, and Pott may justly be called the creators of the comparative study of language. Agglutination, monosyllabic roots, *a*, *i*, *u*, as the three essential vowels, and a mother language—these characterize the belief of the first period of the study represented by them. This period extends to the appearance of Schleicher's (q.v.) *Compendium* (1861), which systematized the views of his predecessors while adding to them his own more stringent but false conception of language as a living organism which in his opinion should be studied by the methods of natural science. An increasing respect for phonetic law (q.v.) marks the close of this period, in which the names of Schleicher and Georg Curtius (q.v.), the latter being one of the first to insist on phonetic regularity, are most prominent. Different languages now began to be studied more carefully, each for itself, and the laws of each more strictly established. New problems arose, such as that of the parent language and primitive vocalism, but Schleicher accepted the views of his predecessors as regards the old problems. The parent speech Schleicher represented as the root of a tree, with trunk, branches, and twigs representing descendant languages and dialects (the so-called *Stammbaum-Theorie*). Like Curtius, he held that the simpler vocalism of Sanskrit was more antique than the variation shown in Europe, and believed that Sanskrit *a* was older than Greek *a*, *e*, *o*. Bopp and Pott instituted comparison, while Schleicher established the common language and determined its essential features as well as its evolution, though he made the fundamental mistake of seeing in this evolution a mere decadence.

Ten years later, in 1872, Johannes Schmidt (q.v.) published his *Verwandschaftsverhältnisse der indogermanischen Sprachen*, which put the interrelation of the different Indo-European languages in a new light. Instead of the *Stammbaum-Theorie* Schmidt set forth the *Wellentheorie*, according to which the different languages had rolled away like waves from a common centre. This view replaced Schleicher's and in a somewhat modified form has been adopted by Leskien, Schrader (qq.v.), and other scholars of the present day. According to it certain words and forms are explained as being common to one section till that splits up and so leaves the contiguous peoples in possession of a common linguistic property, while those dwelling farther apart possess linguistic property which, although originally practically identical, has become so differentiated as frequently to be mutually unintelligible. The obvious objection is that some wave segments may have lost material formerly possessed and others made for themselves what is also found in other segments. This change of view is paralleled by that in regard to vocalism. Instead of assuming that the primitive language had only *a*, *i*, *u*, and that Sanskrit *a* was an older phase as compared with Greek *a*, *e*, *o*, the scholars of the second period, which began about 1862, Brugmann, Osthoff, Col-

litz (qq.v.), and others, showed that the varied phase was older. From 1875 on the new period of development in the study of philology was thoroughly established. No longer was the explanation of primitive forms the essential object of linguistic research; the evolution of each language was henceforth the principal aim. The main efforts of philologists were directed towards the publication of texts, lexicons, and grammars, which gave much new material in many directions, notably in the Indo-Iranian field. Benfey, Roth, Böhlingk (qq.v.), Westphal, Curtius, and Max Müller (q.v.) thus furthered the cause of general comparative philology. At this time also began to be discussed afresh the problem of new formations. The answer to this was given in Whitney's enunciation of the theory of analogy (q.v.). By imitation of the old the new is produced. But especially were the scholars now calling themselves young grammarians insistent upon one principle which became a shibboleth. This was the invariability of phonetic law (q.v.). In the seventies and eighties the various philologists of note in Germany were more or less split up into cliques headed by Georg Curtius, Fick (q.v.), Schmidt, Brugmann, and others, but this was owing less to a radical difference than to personal feeling and may be passed over. In America Whitney (q.v.) centred his attention on the fundamental question of the origin and growth of language, and in so doing came into conflict with Max Müller. Müller claimed that language gives conceptions that could not exist without speech. Thought and word were, in his view, convertible terms. Whitney held, on the other hand, that words are only signs associated with conceptions and that every language known to us is a body of conventional signs for ideas. To Müller language study was a physical science, even in his final revision of the views first expressed in 1862. Language is, however, a human institution, not a physical science, and the failure to recognize this fact undermines the foundation of Müller's view. In one respect only was there an advance in Müller's system on Schleicher. He accepted the physical-science view of language, but he rejected the notion of a primitive Indo-European language from which Sanskrit, Greek, Latin, Germanic, Slavonic, and Celtic were derived, though even here he spoke of the mother language of the whole family. It is remarkable that German scholarship added little to the discussion of the fundamental questions of philology. An exception, however, must be made in favor of Paul (q.v.), whose *Prinzipien* (1880) discussed at length and acutely the causes leading to phonetic and morphologic changes. The great discoveries made by Verner (q.v.), De Saussure, Collitz, Brugmann, Hübschmann (q.v.), and others rendered necessary a complete revision of the comparative grammar of every language, and by 1880 the transformation was so complete that a fourth edition of the *Compendium* of Schleicher, published in 1874, was then considered antiquated. In 1886 Brugmann began his great *Grundriss*, which resumed and completed the work of the preceding 10 years. Since 1880, though a vast number of valuable details have been obtained, especially by Johannes Schmidt, and excellent manuals have appeared, no new principles of any importance have been introduced. During the past 30 years there have been two tendencies notice-

able in Germany. At Leipzig, under the influence of Curtius at first and then under that of Brugmann, there is a decided inclination towards pure linguistics and the preparation of systematic exposés of each question. Leipzig was the birthplace of the principal theories evolved from 1871 to 1880, and from this school have come the greater number of manuals and dictionaries in recent years. At Berlin, under the influence of Bopp, then J. Schmidt and W. Schulze, a keen desire has been manifested to examine directly philological facts and a disinclination to formulate general systems. But all of these tendencies serve only to complete each other. Outside of Germany there are only two important schools, the Russian, under the leadership of Baudouin de Courtenay and Fortunatov, and the French, founded by Bréal (q.v.) and continued by the brilliant De Saussure, who was professor at the Ecole des Hautes Etudes from 1881 to 1891. His distinguished pupil, Meillet (q.v.), has upheld these traditions. The method employed in the study of the Indo-European languages has also been applied with equal success to other families of languages, such as Semitic, Finno-Ugrian, African, etc.

Field of Investigation. Turning now from this historical outline of the growth of the science of philology to the subject matter of the science, it will be necessary first to explain the field of investigation. Comparative philology as applied to the Indo-European or Indo-Germanic languages (q.v.) first demarcates those languages from others. This family constitutes a single group, separated both by vocabulary and by structure from other groups of languages. Whether the Indo-European group had at any time a common origin with other groups passes human knowledge. Many scholars—Ascoli, Abel (qq.v.), and others—have made abortive attempts to connect Indo-European forms with Semitic, Mongolian, and Egyptian forms, but nothing cogent has been produced to show that there is any radical affinity between them, though there has often been connection. The name Indo-European is only one of many, but at present the usual one, to designate the group called in German quite as often Indo-Germanic and in English frequently Aryan (q.v.). The last name is one often used by German scholars to designate the narrower group of Indo-Iranian. The members of the Indo-European group are the subgroups known as Indic, Iranian, Anatolic, Hellenic, Celtic, Teutonic, Balto-Slavic. Some scholars add Albanian (q.v.) as a separate subgroup and some particularize Armenian as a subdivision on a par with Hellenic. (See below.) These subgroups include a great number of languages and dialects, various in themselves and in some cases intricately combined. The chief elements making each group are:

Indic. Sanskrit and the pre-Sanskrit Vedic language. The former name is often made to cover both divisions, but, like English in relation to Anglo-Saxon, though conveniently used, it is not accurate. There was no Sanskrit language (q.v.) till after the Vedic period. Whether Sanskrit is derived from the Vedic cannot be absolutely proved. It is closely connected with that earlier language, but it is quite possible that the two are dialectic variations from the start. Evidence given by the Linguistic Survey of India seems to show that there were two main Aryan invasions of India, entering by two different

routes and at different times; that those speaking the Vedic language were the first comers, afterward pressed to the wall by the ancestors of those who in course of time spoke what we call Sanskrit. Opposed to Sanskrit is Prakrit (q.v.), a general term for various dialects recognized at an early date as being not Sanskrit and yet not foreign. The language of Hinayana Buddhism, Pali (q.v.), was one of these patois. It is closely related to the Vedic language, and may be as old. Corresponding to the patois Prakrit dialects of antiquity are the modern provincial dialects, Bengali, Panjabi, Gujarāṭī, Hindustani, Marāṭhī, Uriya, Sindhi, Kashmirī, Nāipālī (q.v.), Pushtu (see AFGHAN), reflecting, however, more or less the effect of Sanskrit. A European offshoot of this division is the Gypsy language of Europe, many of whose words (verbal roots) are still identical with those of Sanskrit. (See GYPSIES.) The oldest literary remains of this group are from 1000 to 1200 B.C., though some scholars assign a much greater antiquity to the Vedas, the earliest Indic literature. See also PISAOA LANGUAGES.

Iranic. This group, the name of which is derived from Iran (Eran), the great plateau including Persia, Afghanistan, and Baluchistan, can be traced from quarters contiguous with the Indic group, and is closely connected with the latter. In fact, Indic and Iranic (Aryan in the narrower sense) are both dialects of the same language rather than separate languages. Especially is this true of the Old Bactrian (Avestan or Zend) division of Iranic (see AVESTA), the sacred literature of which extends back to about the seventh century B.C. Opposed to this division is the Old Persian (q.v.), sometimes called the Western dialect in antithesis to Avestan as the Eastern. Old Persian is the language of the cuneiform inscriptions of the Persian kings, and this alone survived as a spoken language, being gradually modified into Pahlavi (q.v.) and New Persian. Other Iranic dialects are Baluchi, Kurdish, and Ossetic (q.v.). See PERSIAN LANGUAGE.

Anatolic. This group comprises Armenian (which was formerly regarded as Iranic and is now sometimes accorded a separate division, see ARMENIAN LANGUAGE), Phrygian (q.v.), and Scythian, and until lately was supposed to be represented by Lycian (q.v.) and Carian also. Later investigations, however, have shown that the two latter do not belong to the Indo-European group, and Scythian applies only to such remnants of Indo-European origin as are represented by some of the names of nomads in southern Russia and on the border of Asia Minor. As such the division is maintained by Fick, but it rests on very doubtful evidence. The oldest literature is of the fourth century, unless the recently (1902) interpreted Arzawa language assigned to Cappadocia be regarded as Indo-European (c.1400 B.C.).

Hellenic. This comprises all the old Greek dialects, Ionic, Doric, etc.; Albanian (q.v.), a mixture of Greek and foreign elements; also the modern dialects of Greece. (See GREEK LANGUAGE.) The literature goes back to about 1000 B.C.

Italic. This division includes Latin, Umbrian, Oscan (q.v.), and other minor dialects; modern derivative dialects, in part primitive, in part due to foreign elements, Italian, Provençal, French, Spanish, Portuguese, Rumanian, etc., called in general Romance. The literature dates

from the third century B.C. (inscriptions still older). See ITALIC LANGUAGES; LATIN LANGUAGE; ROMANCE LANGUAGES.

Celtic. This group comprises (1) Cymric or Brythonic (Welsh, Breton, Cornish); (2) Gaelic (Irish, Manx, Gaelic—Scottish). The literature can be traced back to the eighth century A.D. See CELTIC LANGUAGES.

Teutonic. Originally Gothic (see GOTHIC LANGUAGE) and non-Gothic were the only divisions. These subsequently, on the basis of one euphonic change, were differentiated into Low and High German. The old divisions, still recognized by many scholars, are: (1) High German (Old, Middle, New); (2) Low German (Gothic, Saxon, Dutch, Frisian); (3) Scandinavian (Norse, Icelandic, Swedish, Danish). Gothic literature (translations of the New Testament) is of the fourth century A.D., but linguistic forms cited by Roman writers are earlier. See TEUTONIC LANGUAGES; GERMAN LANGUAGE.

Balto-Slavic (Slavonic). It is customary to unite these languages, which, however, stand as far apart as do Indo-Iranic. The Baltic (or Lettic) division, embracing the Old Prussian (q.v.), Lithuanian (q.v.), and Lettic (q.v.), the last-named spoken in Courland and Livonia, forms a unit over against the Slavic division (see SLAVIC LANGUAGES), which is divided into a large number of dialects incapable of being subdivided into different groups, though one division into Eastern, (South) Eastern, and Western and another into two subdivisions are sometimes made. But phonetics and morphology together prevent such classifications except as a matter of convenience, all the dialects being more or less related, but not in such a way as to show that any of them formed subgroups. A common and convenient geographical distribution is into the Western group, Polabian (formerly spoken in north Germany), Polish (q.v.), Sorbian (represented by the Wendish spoken in Lusatia), Czechish (spoken in Bohemia, Moravia, etc.), and the (South) Eastern group, Servian (see SERBO-CROATIAN), Slovenian, Bulgarian (q.v.), on the one hand and Russian (q.v.) on the other. Literary fragments go back to the eighth century. In the (narrower) Baltic division, however, a catechism of the sixteenth century represents the oldest known form of the dialect.

Inner Relation. Having thus sketched the geography of these parts of the Indo-European languages, we must next inquire whether any of these parts hold to each other especially close relations. Much that here seems obvious shows itself to be misleading. Thus, Latin is often regarded as standing in a peculiarly close relationship to Greek. In point of fact, however, while the Greek and Latin literatures are closely connected, there is no special kinship of the two languages. To detail all the groupings by subdivisions that have been urged by different scholars would take too much space, but the most practical historical differentiation is based on the varying treatment of the gutturals and vowels. In Hellenic, Italic, Celtic, and Teutonic, *k* and *q* represent the *ś* and *k* of the Eastern languages. The Sanskrit *tenuis* is preserved in the Western group, but the media and aspirate are modified to *j* and *h* (confused with the palatal evolution). The Western group had a pure *k* instead of the *ś* series, and *q* sounds (tending to become labials) instead of the *k* series. Examples of the *k* series are Hellenic *ἐ-κάρων*, Italic

centum, but Indic *śatam*; *ōxēs*, wagon, but Avestan *vasōiti*; of the *q* series, Italic *quod*, Indic *kad*. In vocalism the Eastern group has a simpler series than the Western. Now, between these extremes lies the Balto-Slavic (and in part the Anatolic) system, which agrees with the Eastern group in having the *ē* and *k* series (as against the *ē* and *q* series), but with the Western group in its more varied vocalism. There are no divisions of the languages which are of so marked a character as these of the *satam* and *centum* divisions. Latin stands near to Celtic in some forms (future and passive), but near to Sanskrit in others (e.g., the ablative). So in some aspects of morphology Balto-Slavic, Sanskrit, and Greek are akin, while in others they stand apart, and such resemblances and divergences are found among the other languages as well. What the inner relation may have been cannot be more nearly established by a comparison of forms, still less of vocabulary, and it seems safest to establish as subgroups only Eastern (Middle) and Western divisions. That Indic and Iranian lie so closely together may be due rather to their closer synchronism than to an originally greater similitude.

Before proceeding with the discussion of the inner relationship of these groups as shown by sounds, forms, and syntax, it is necessary to revert to the question of the primitive language, which, as was shown above, occupied so large a share of the attention of Schleicher. Since his day the problem has assumed a new form which may be studied under two aspects, geographical and dialectical. It was the opinion of the older Sanskritists that the earliest home of the Indo-Europeans was on the Pamir table-lands. Other sites have been assumed—the plains of Europe, Scandinavia, and many other centres. But on the basis of a comparison of the common vocabulary of all the languages and the state of culture represented by it, present opinion, induced largely by the results of Schrader's studies, inclines to the belief that the original home of the Indo-Europeans was on the plains north of the Carpathian Mountains. A very important contribution to the question was made by Schmidt, who tried to show that the duodecimal system of the Indo-Europeans was derived from Semitic sources. The discovery in 1902 of the Arzawa Letters (see above) would strengthen the belief in an early intercommunication between Indo-Europeans and Semites. These data, if accepted, would show that the Indo-Europeans at a very early period were near neighbors of the Semites and perhaps in close communication with them. Further, it is known that trade communication between the north of Europe and the southeast, possibly Semitic, took place at an early date, and, finally, it is scarcely to be doubted that Indo-European language and Indo-European race are not terms implying an identity of race and language. In short, language proves nothing with regard to race. This truth leads to a clearer insight in regard to the parent speech. Instead of imagining that there was a racial unity once marked by linguistic unity, we must inquire whether, in giving up racial unity as shown by language, we must not also renounce all attempts to establish a former linguistic unity. The answer will undoubtedly be an affirmative, and it is rendered more probable by all that we know of modern languages. The German dialects, e.g., show no trace of ever having been identical in form. Still more strik-

ing is the illustration given by Slavic as compared with Baltic. In a word, there was no parent speech of the Indo-Europeans, but there were always related dialects. (See DIALECT.) Thus the smallest dialect, geographically speaking, of Greece or Rome may preserve forms as ancient as any other. The idea of a language unity splitting up into dialects and these again into subdialects is probably a false conception. Codialectic forms is doubtless the only right expression. All efforts made to trace out a parent speech are based largely on doubtful data of the use of words regarded as original, although we do not know whether the words may not have been borrowed. All reconstructions of the parent speech, whether in the form of literature (such as Schleicher indulged in) or in the form of reconstructed hypothetical words, which are supposed to represent the sound of the primitive language and are constantly employed in our comparative grammars, are pure fictions of the imagination and are not to be regarded as representing an actual prehistoric condition of the language. We know the Indo-European languages only in dialectic form, as spoken by various races over a wide area. The dialects are divergences from each other, not, so far as we know, from any unitary parent speech. A universal parent speech is a historical possibility, but an Indo-European parent speech is merely a convenient hypothesis, which, however, leaves more to be explained than it explains, and may well be discarded, however pleasing it be to the mind that prefers unity.

Phonology. The regular interchange of certain sounds in the different languages of the Indo-European group was usually postulated at an early period, without the later insistence on the necessity of regularity. At first it seemed as if there were exceptions which could not be explained by any law. The sounds first compared were consonantal, as these seemed most regular. Their correspondence in certain of the Indo-European languages was formulated by what is known as Grimm's law (q.v.).

The vowel system took longer to explain and the consonantal system required modification. In the case of the vowels, apart from the determination of the long-disputed point whether the *a*, *e*, *o* of the Greek or their equivalents in one *a* sound, as in Sanskrit, represented the older state, the vowel system was seen to be more regular as soon as the primitive existence of sonant nasals and liquids was recognized. The chief modifications of Grimm's law, known as Verner's law (q.v.), and further contributory laws were established during the last quarter of the nineteenth century. At the same time was raised the question in regard to the original vowel form of roots and that of its changes in ablaut or modified vowels and diphthongs.

The priority of the Western *a*, *e*, *o*, as compared with the Asiatic monotone *a*, was proved by Amelung and Brugmann at about the same time (1876). Next was shown the existence of an Indo-European *e*, i.e., of a real palatal vowel, in Sanskrit itself. This was proved by Collitz and De Saussure, and independently by Verner, through demonstrating that when a Sanskrit *a* (= *e*) follows a guttural it palatalizes it and hence must itself be palatal. Thus, Sanskrit *as* = Gk. *es*, Lat. *que*. This discovery revealed at once that the vowel systems of Greek and Oscan were the faithful representatives of the Indo-European, the Indo-Iranian losing thereby

much of its preponderance. About the same time Ascoli discovered that there were two distinct series of gutturals in Indo-European. Osthoff (q.v.) and Brugmann, again, pointed out the existence in Greek of the Sanskrit *l* and *r* vowels, as shown, e.g., in *παρδοι* (= Sk. *pitrāu*), *ἔδρακεν*, etc., and that just as this *r* vowel contained heterogeneous elements, so there were an *m* and an *n* vowel in Indo-European, absolutely distinct from the consonants *m* and *n*. Then, as opposed to the view of the Hindu grammarians and early European scholars, it was shown by De Saussure in 1878 that in the series *i*, *e*, *ai*, the simple vowel is no more radical than is the *guṇa* form, *e*, *ai*, or, in other words, we cannot speak of the stem in *φέρω*, to take an analogous case, as being less original than that in *ἐφύρον*. This theory of vowel gradation led to the discovery of the existence of dissyllabic roots in Indo-European, thereby completely upsetting the old dogma of the monosyllabism of Indo-European roots.

In discussing consonantism the designations of other than the guttural series are self-explanatory, but in the guttural series there is great confusion of nomenclature. Thus, the Indo-European languages had palatal sounds, *a*, *j*; dentals, *t*, *d*; labials, *p*, *b*, both aspirated and nonaspirated. So they had aspirated and nonaspirated, surd and sonant gutturals, *k*, *g* (*kh*, *gh*). But these latter, being, as explained above, of twofold form, have different designations. There are two series, the palatal and nonpalatal guttural series. These are sometimes distinguished as palatal and velar, but the former is also called the *é* series and even the *k* series, while the latter is called the *q* series and also the *k* series. The velar *k* series was from the beginning distinguished from the palatal guttural by being a sort of back guttural, with a tendency to develop a half-vowel sound (*q^u* or *k^u*), which was lost in special languages. The two sounds either united or the guttural became more labialized (Skt. *ka*, Lat. *quo*, Goth. *hva*), a tendency that reached an extreme in Greek, where this guttural is often represented by a labial, as in *πo* (also before nasals and liquids), though sometimes dentalized, as in *πe* (before *i*, *e*), while sometimes coinciding with *k* (*κωs*). Besides gutturals and palatals, the Indo-European group possessed the consonantism just described, but it was defective in fricatives and spirants (e.g., *f*, Eng. *th*, *z*). Peculiar to the older language are the aspirated sonants retained in the Indo-Iranic group beside aspirated surds, as well as the modified nasals and sibilants, *n*, *s*, including *m*, the final half nasal, and final half sibilant. As already explained, Indo-European had as half vowels *y*, *v*, *l*, *r*. Lingual sounds (found in Sanskrit) appear to be borrowed from the Dravidians.

Before passing on to the subject of morphology it will be necessary to speak of one of the most important topics discussed, though not definitively settled, in the last few years. Verner showed that accent or stress influenced the character of consonants according to the accentuation of the syllable. The effect of stress, however, as already explained, is also patent as regards the vowel, which, as in *οἶδα*, *ἔδμεν* (originally *ἔδμεi*), shifts with the accent. But of late it has been shown that another very important law of accentuation has been at work in determining the form of stems. Fick and Möller have emphasized the importance of pitch, i.e.,

musical accent, as contrasted with stress accent. They show that there is a certain relation between the palatal vowel and a high pitch; and a guttural vowel and a low pitch, a relation explicable on physiological grounds; the action of the vocal organs naturally associating the high pitch with the palatal *e* and the low pitch with the guttural *o*. Thus, there is a natural connection between the accent or nonaccent and the form of the two vowels in *λέγω*, the *e* vowel having the high pitch, the *o* vowel having the low pitch. This matter has not yet been thoroughly investigated, and there are many phenomena not yet explained by it. For example, in *λόγος* the low pitch has the stress. But at all events, accent is evidently a factor which will, when properly understood, explain much in stem formation.

Morphology. This studies change of form and the cause of change. The chief factors tending to change the form of words are phonetic degeneration, as it used to be called, or phonetic variation and growth, due partly to individual peculiarities, but more to the attrition of speech, force of expression, the law of least resistance, and the interaction of the individual and his environment. Change of stress and change of pitch and the substitution of stressed accent for pitch affect the form as well as the accent of words. Analogy (q.v.), especially false analogy, causes changes, in the endings particularly, and the growth or change of function in one class of words is liable seriously to affect the form and even the existence of words of another class. Imitation, due to association, may be conscious or unconscious. Complete changes in the pronunciation of a vowel may occur over a wide area in a short time and then remain or as suddenly disappear. Most of these changes of form are the result of a long series of gradual minute alterations, intervening in time, both in phonetics and in morphology. Difference of meaning may be mentioned last as having had effect on form, a factor more or less connected with accent. Apart from these questions of the philosophy of change, morphology has to do with the forms as presented in language, which may most conveniently be discussed under the head of roots (see Root), stems, the forms of nouns, and the forms of verbs.

In regard to the stem complex of root and ending, apart from a vague theory of Westphal that near and distant sounds have something to do with stem formation, only one theory has been opposed to Bopp's agglutination theory. This is a profound study by Ludwig, marred only by the assumption of absolute lawlessness in phonetics. The points made are that the endings serve different purposes, a first person serves as third, a locative as a genitive, etc., and the farther back we go the looser is the language. Ludwig substitutes for agglutination, therefore, the theory of adaptation. Verbal endings are not from pronouns; no personal endings existed; before the verb was the indefinite infinitive used for any person, any tense, and both imperative or indicative in meaning; suffixes acquired definite implication by a gradual adaptation of special meanings, having originally only a demonstrative sense. While containing much truth, this adaptation theory is too exaggerated to be acceptable as a working hypothesis. Another theory, that of Scherer, regards endings of stems of verbs and nouns as indicating a locative sense, while Benfey traced all endings from

verbal termination *anti* (believing that nouns are from verbs); but the last two views are too fantastic to be discussed.

Forms of Nouns. The same word is noun and verb in its most primitive form, as Sanskrit *dāti*, a giving, or he gives. Nouns had seven cases, perhaps more, in Indo-European. The same case had different endings, but, on the other hand, it is most likely, despite the fact that this seems to point to other cases, that, had such cases existed, some traces would have been preserved. Different endings may gradually have become restricted in application, and, as in the case of the Greek dative, different functions may have been absorbed by one ending, tending to a loss of another ending. The seven cases have endings more or less uniform, but, apart from modifications caused by the form of the stem, some cases are compounds of two case endings and some cases show different forms according as a word is declined as noun or pronoun. The seven cases are nominative, accusative, instrumental, dative, genitive, ablative, locative. They are found in the singular, dual, and plural, but except for the nominative and accusative dual in *du* (*dv-āu*, *duo*) the dual endings are not identical in the different languages and are omitted here. The vocative is not a case, but the bare stem in weak form. An apparent ending in the *o* stems is only a vowel weakening. The chief endings are:

Nom. sing., *s*, *m*; pl., *os* (*es*), (*o*)*i*, [*ā*].

Acc. sing., *m*, *d*; pl., *ma*, *ā*.

Instr. sing., *e*, *a*, *bhi* (*mi*), *na*; pl., *bhis*, *o-i-s*.

Dat. sing., (*ai*), *e*, *bhya* (*m*); pl., *bhyas*.

Gen. sing., (*o*)*s*, *sia*; pl., *om* (*ām*), *sām*.

Abl. sing., [*os*], (*a*)*t*; pl., *bhyas*.

Loc. sing., *i*; pl., *su* (*si*).

The ablative is lacking in the singular, except in a few nouns and pronouns, and in the plural, borrowing the forms of the genitive singular and dative plural. The plural *os* (*as*) is the noun ending in Sanskrit; *ai* (*oi*) the pronoun ending in Sanskrit and Oscan, and the noun ending in Slavic, Greek, Latin, Celtic, and Gothic. Both *i* and *s* serve as plural signs, the latter being added to the nominative, accusative, instrumental, and dative. Some endings were independent words, e.g., *i*, *u*, *a*, *āt*, and Sanskrit still has cases made by adding *ā* to *ē*. Adjectives have noun endings (with some restrictions). The comparative *tara* means farther (also *has*, *hos*). The superlative, *tata*, *tama*, and *ishta*, is not clear. Numerals have essentially the same form in Indo-European, *ai-ka* (*oinas*), *dya*, or *statam-centum*, up to *χίλιοι* = (*sa*)*hasra*, though the latter identification is very doubtful, and in any case may mean heap, or large number, rather than a definite thousand. The duodecimal system is clearly marked in Sanskrit higher numbers alongside of the decimal system. (See above.) Participles are part of the noun system and the stems end in *ta*, *na*, *m(a)na* in Sanskrit, Avestan, Greek, and Latin. Prepositions (adverbs) may have case endings, e.g., *παρά*-*i*, *παρά*, *πρόσω*.

Forms of Verbs. The Indo-European languages had four tenses, present (imperfect), aorist, perfect, future, and four modes, indicative, subjunctive, optative, and imperative. Only the first three tenses are pure, the future being modal (will), and consequently is found only in the indicative, with rare (Vedic) and late (Greek) exceptions. There are two voices, active and middle, the latter serving originally as

a passive as well. Secondary conjugations of the prothetic period are numerous. The most clearly defined are causative, denominative, intensive, desiderative, and inchoative. Sanskrit further invented a passive class, and Latin and Celtic had a special passive voice, while Greek and Sanskrit converted certain aorist forms into passives. There are three numbers, but the dual is weak and even in the oldest Vedic and Greek interchanges with the plural, being lost in Celtic and Latin (save for the ending *-tie*), though preserved in Gothic and Balto-Slavic. Verbal endings are primary and secondary (present and preterit); special endings occur in the perfect. Omitting the dual, these endings in Sanskrit, which has preserved them most fully, are in the active singular, 1, *mi*, *a*; 2, *si*, *tha*; 3, *ti*, *a*; plural, 1, *ma*, *ma*; 2, *tha*, *a*; 3, *a(n)ti*, *us*; while the middle changes *i* to *ē*, and *ma*, *tha* to *mahē*, *dhvē*, and the preterit tenses drop the final vowel and have *mahi*, *dhvam* for *mahē*, *dhvē*. The preterits and the perfect have also certain *r* forms, *ram*, *rē*, etc., like the Latin passive. The present stem is divided into many classes, of which 10 are recognized by native Sanskrit grammarians. Including secondary conjugations, the Indo-European languages had in all 32 ways of varying the stem by infixes, suffixes, and changing the vowel of the root. Many of these verbal stems coincide with nominal stems. They appear originally to have indicated modified forms of action. The aorist stem is formed either by reduplication, like the perfect, or by inserting an *s* element, like the future, or it may be differentiated from the present class merely by the vowel or by an ending (*βῆ*, *βάσκω*). The future has primary endings, but in Sanskrit may be augmented with preterit endings, making a conditional. The subjunctive and optative have different formative elements and their endings are originally the primary and secondary, respectively (see below), while the imperative has preterit endings modified, or special forms. It has no modal sign. In some classes of verbs the subjunctive form coincides with the indicative. Hence *ā*, the subjunctive modal sign, Greek *η*, is not locative, as Scherer taught, but probably due to analogy. The optative sign is *ja* when accented, *i* when unaccented, as shown by J. Schmidt; whence *i* is probably a reduction from *ja* (cf. *yā*, *go*, though this derivation is not favored by Schmidt).

As to the personal endings, with the exception of the third plural (and the dual), Delbrück (q.v.) thinks they are connected with the personal pronouns, but, if so, they must go back to a period when they were more deictic than pronominal. The singular affixes *mi*, *si*, *ti* have been explained (not very convincingly) both as taken from the pronouns and as having originated the pronouns; but the plural *anti* is probably connected with the participle, the *i* being explained by Ascoli and Brugmann as due to analogy with *ti* (a locative in Scherer's opinion). This finite verbal form would then be analogous to *amamini* (also a participle). The middle endings have been explained as strengthened forms. In Sanskrit the only original strongest form is *āi* (*ēi* and *tāi* being later), a still stronger form of *ē*, which lends color to this (still doubtful) suggestion. Verbal stems were originally not connected with prepositions (most of which are adverbs); hence Latin compound verbs are later than Greek and Sanskrit, and tmesis in the lat-

ter is really the older form. New forms have been developed in the separate languages, e.g., aorist passives, the future optative and future infinitive in Greek; a third singular preterit aorist passive and a complete *ya* passive in Sanskrit; *r* passive and *bo* future in Latin and Celtic. Greek, like Sanskrit, is older than Latin in having fuller endings, a middle voice, and an augment. The other Indo-European languages have later verbal forms. The augment may have had a short and a long form, *e*, *η*, and survived in Sanskrit, Persian, and Greek, with traces in Avestan.

Syntax. Only the chief points can be noticed here. First, as to the syntax of nouns: The old distinction between grammatical and nongrammatical cases cannot be maintained. The nominative designates the active, the accusative the passive relation. The latter is both an object of a verb and an object of thought. With space and time the accusative is still a veiled object case. The instrumental shows accompaniment, means, limit; the dative, "to" or "for"; the genitive, any adjectival relation, "of," "belonging to"; the ablative, source and means, "from," "by"; the locative, place or time, "in," "at," "within." The syntactical method of Delbrück assigns to each case a certain narrow function, as either "in" or "within" (but not both) to the original locative; "to" or "for" (but not both) to the dative; etc. But each (pure) case originally contained in itself all that is ascribed to it; the dative from the beginning was a "to" and a "for" case; the locative expressed both "at," "in," and "within." The instrumental survives in adverbial form in Greek, but the Greek dative singular is a locative. The genitive in *sta* is an adjective stem like that of the pronouns, *asmāka* (*m*), *nostrum*, *nostrī*, which explains in part the syntax of the case. So the Latin *i* genitive may be adjectival (preserved in other Italic dialects instead of changing to *oi* or *ei*, which would be the locative form). Other genitive syntax is explained as being due to a sort of adjective-compound effect, in that the sign *as* (*os*) is probably only a nominative affected by sentence accent. So *s* is the sign of the nominative as well as of the genitive. The ablative was probably confined at first to the singular pronoun, where it seems to be from an adverbial affix. Such syntactical growths are common, prepositions (adverbs) being affixed also to completed endings to emphasize the meaning, as *m* is added to the Italic locative, *ā* to the Avestan locative, or *i* to the Latin feminine nominative, *quā-i* (*quā*). In the last-named case the meaning is probably only emphatic, just as in English *yes-sir-ee*. The nominative *s* has been associated with the demonstrative pronoun. The *m* of the accusative is identical with the *m* of *aham*, *idam*, *ēgōn*, *idem*, though what shade of meaning it may have had is as impossible to explain as is the pseudo ending of the German *mi-ōh*. The neuter nominative in *m* has been explained as borrowed from the nominative, on the ground that neuters were originally not subjects of verbs; but this is improbable.

In verbs present-tense stem connotes durative time; the aorist, unrestricted time, either inchoative or resultant; the perfect, repeated present (inchoative or intensive); the future, modally affected future (will). The subjunctive gives the idea of the unrestricted indicative with the addition of a shall or will element

(time and mode); the optative expresses "should" or "might"; the imperative, a command. The aorist may be present or preterit in time, and differs from the present-stem meaning only in its quality, since it does not express continued or durative time. Thus, Sanskrit *gacchati*, present, is "he continues agoing," but *gāti*, aorist, is "he goes." The present may thus do duty for a future, as in Gothic. The verbal stem being coincident with the noun stem, the sense of *bharati* is really "a bearing, that," or "he is abearing," rather than "is a bearer." The reduplication of the perfect connects it with the reduplicated present, desiderative, and intensive forms, and in its first application it connotes present time, afterward extended to past time, perhaps helped thereto by the pluperfect (with augment), which in Sanskrit is not so much a pluperfect as a reduplicated aorist. The tense of narrative was originally the imperfect, not the aorist. The syntax of the Greek aorist is complicated by the confusion of aorist and imperfect forms. In Sanskrit future (will and pure future) and optative complement each other and eventually suppress the subjunctive altogether.

The subjunctive, as already stated, has originally primary, the optative secondary, endings; but in Sanskrit the former has taken some secondary endings and in Greek the latter some primary endings. These endings are significant. The optative goes with the imperative and injunctive, modes of wish and command; the subjunctive with the future, "shall" and "may." Delbrück believes that the subjunctive originally expressed will, the optative wish. But his categorical system of syntax is unable to explain the potential sense of the optative and the future sense of the subjunctive. The subjunctive originally connoted a vague shall-will, at the pleasure of the speaker. The primitive subjunctives, *ἔδομαι*, *ero*, are, in fact, simple futures. So the optative expressed both should and might. In Latin the subjunctive is partly optative. The Homeric subjunctive is later limited to half of its functions. Sanskrit has a distinct precative optative to express wish. Here, as elsewhere in grammar, linguistic machinery of a rough sort was slowly adapted to growing needs, and many shades of meaning were expressed under one form. Vulgar English shows continually how men without discrimination get along very comfortably with the same tense and mode and ending for many situations. In regard to the imperative, which has secondary endings, it was originally used only in the present and for commands, not for prohibitions. Hence, *μή* is used with the subjunctive aorist, and later with the present imperative only as an extension. So a subordinate negative clause takes *μή*, as *ὅς μή ἔλθῃ* (shall not come). Thence the use was extended (*εἰ μή* with indicative). Some scholars assert that the optative was originally potential, for the pure optative is used with *οὐ*, not with *μή* (for wish). It is worth noticing, in connection with the Greek secondary endings, that when used without augment they may always indicate a command, as in the Sanskrit injunctive, which is an unaugmented preterit.

The determination of the meaning of cases, of tenses, and of moods does not exhaust the store of syntactical problems upon which light has been thrown by comparative philology; but these are the most important aspects and they

show sufficiently what has been accomplished. The discovery of new cases (instrumental and locative) in Sanskrit, not recognized in the classical languages, laid the basis for a thorough treatment of case relations, as the discovery of the injunctive and the Vedic values of subjunctive, optative, aorist, and perfect first clarified the problems connected with the verb.

Modern Tendencies. A typical example of the relation between the stages of growth in the study of philology is given by etymology (q.v.). Before Pott there was an utter want of scientific method. Pott opposed this looseness. Curtius again opposed Pott for 30 years on the ground that Pott was not strict enough. The young grammarians in their turn attacked Curtius because he refused to admit that phonetic law is irrefragable.

More recent studies have made etymology much stricter still. To cite a famous example, of all the parallels in the names of Greek and Hindu gods utilized by Müller in his mythological studies, only one case, Dyaus-Zeus, is now regarded as certain. On the other hand, in regard to the constancy of phonetic law, the modern tendency has been to claim that the new school went too far. Bechtel, in 1892, and since then other scholars have questioned the validity of the shibboleth of changeless law. Other doubts have risen in the last decade on other fields. Stress accent has been replaced in part by musical accent in importance. Schmidt's wave theory has been modified. Semitic influence, as shown in numbers, has been replaced by a putative Dravidian influence, but this matter is unsettled. In geography Lycian and Carian have been definitively removed from the field of the Indo-European languages. The importance and antiquity of Pali (q.v.) has been brought to the fore. The possibility of reconstructing a parent language has been rendered quite doubtful. Syntax, the need of which was first shown by Bréal, has virtually been built up by one great German scholar, Delbrück. It was the latest task of philology. Naturally the principles thus swiftly built into a system by one man are open to revision. Signs are apparent that the categorical method hitherto employed has ceased to be useful in helping to discover the genesis of syntactical change. Delbrück himself has admitted that his results are founded chiefly on subjective impression. Other scholars question, not the value of the facts amassed by Delbrück, but their interpretation, in criticism that began with Whitney and has tacitly been accepted by Brugmann, Speyer, and other interpreters of syntactical data. In like manner the motive of phonetic change as explained by Delbrück has been attacked by Wundt, Meyer, and Oertel, who have respectively sought to show that phonetic change depends largely on ease (or speed), strength of expiration, and geographical environment.

But besides laying stress on new points of view of minor importance, such as haplography, philology has recently brought to the fore one principle and elevated it into the dignity of a new branch of the study under the name of semantics, or semasiology (q.v.). In 1897 Bréal published his *Essai de sémantique*, which organized into a systematic whole, under different categories, transfers of meaning in the evolution of words. Contiguity, resemblance, and contrast were shown to cause changes of meaning. Our word "pike" for "road," e.g., arose from "turn-

pike road," with a gradual reduction of the phrase to its most characteristic element (the pike or pole which turned the stile at a tollgate) to represent the whole.

For the past 20 years, then, it has seemed that the study of philology has reached its limits. Newly discovered texts, such as that of Manichean Pahlavi, Sogdian, Eastern Iranian, or even of the loudly hailed Tokharian, add only details or confirmations—both valuable, however—to the already established theories. A language more ancient than Vedic or Greek and of equal importance would be necessary to change the conception of Indo-European. Many are even inclined to believe that very important results may come from a satisfactory comparison of the Hamitico-Semitic or Ural-Altaic to Indo-European. However that may be, since 1900 philologists have devoted their most active attention to the study of dialects. This work has been initiated in a most brilliant manner by Gilliéron and Edmont, whose *Atlas linguistique des parlers français*, in 1915 being finished, has shown that the influence of central dialects, and especially of common languages, is immense. Considerable help may be expected also from the study of experimental phonetics (q.v.), developed especially by Rosapelly, Roussetot (q.v.), Scripture, and others, through which a more rigorous interpretation of linguistic facts becomes possible. And since Wundt applied psychological results to linguistics numerous efforts have been made, the most noteworthy of which is that of Ginneken, towards a closer *rapprochement* with this science.

In 1915 it seemed that the study of philology was undergoing a process of transformation. There was a decided reaction against *Sprachmischung*, or the mutual penetration of two dialects, the method postulated about 20 years ago by the German school under the leadership of Schuchardt (q.v.). This scholar believed that by this method one could arrive at general laws applicable to all possible cases. The great defect of this system was that it failed to take into consideration numerous historical factors as well as variable accessory circumstances. The new French school, with Meillet (q.v.) at its head, rejects entirely the esoteric philology which isolates linguistic facts from all contact with life, and attempts to interpret linguistics by the social movements of civilization—in brief, to recognize in the development of languages the result of political and social actions. Such a doctrine necessarily implies the subordination of theory to fact and the restoration of the written language to its former place of supreme importance.

PHILOLOGY, CLASSICAL. See GREEK LANGUAGE; ITALIC LANGUAGES.

PHILOMEL (Lat. *philomela*, from Gk. φιλομήλα, nightingale, from φιλεῖν, *philein*, to love + μέλος, *melos*, melody). A nightingale, especially the Persian. See NIGHTINGALE.

PHILOMELA (Lat., from Gk. Φιλομήλη). In the Greek mythology, a daughter of Pandion, King of Athens, and sister of Procne. In reward for assistance rendered, Pandion gave Procne as wife to Tereus, King of Thrace, who became, by her, father of Itys. He then dishonored Philomela, pretending that Procne was dead, and to prevent her from telling her wrongs cut out her tongue. Philomela, however, by weaving words in a robe, revealed the truth to Procne, who, to punish her husband, killed her son and served him up to Tereus. The sisters then fled, but, being pursued by Tereus, were changed into swallows or nightingales, while Tereus became a hoopoe or hawk.

PHILOMELA, THE LADY FITZWATERS' NIGHTINGALE. A romance by Robert Greene (1592). It is founded on an Italian story of jealousy, perhaps that of *Tito and Gisippo* in the *Decameron*.

PHILOPOEMEN (Lat., from Gk. Φιλοπομπήν, *Philopomēnē*) (252-183 B.C.). The most illustrious statesman and general of Greece in the period of her decline, the great object of whose life was to establish the independence of his country on a firm and lasting basis. He was born at Megalopolis in Arcadia, of a noble family. At an early age he lost his father and was brought up by a wealthy citizen of Mantinea named Cleander, who secured for him a careful education. He received instruction from the academic philosopher Ecdemus and Demophanes, ardent champions of freedom. His first experience in warfare was gained in the border raids that took place between the Arcadians and the Laconians, and in 222 B.C. he with a few others defended Megalopolis against the attack of the Spartan King, Cleomenes. In the following year, when the Macedonian King Antigonus came to the assistance of the Achæans, Philopœmen joined him at the head of a band of horse and distinguished himself in the battle of Sellasia (221 B.C.), in which the power of Sparta was completely broken. Philopœmen then went to Crete, where he lived 11 years; on his return in 210 he became commander of the Achæan horse, and in the expedition of 209 against Elis distinguished himself for his bravery, slaying with his own hand the Elean leader, Demophantus. In 208 he was chosen strategus or commander in chief of the Achæan league, a place that he held eight times. He proceeded at once to introduce reforms in the discipline and equipment of the soldiers and soon, by these means and by his personal influence, made the army a most effective instrument of war. In 207 he defeated the Spartans under Machanidas, and at the Nemean festival that followed the people proclaimed him liberator of Greece. In 201 he defeated Nabis, who had succeeded Machanidas as tyrant of Sparta. Soon afterward he made another voyage to Crete. Returning to the Peloponnesus in 194, he was appointed strategus in 192 and again defeated Nabis. Shortly after

this time he compelled Sparta to enter the Achaean League (see *ACHÆA*), and when she revolted, in 188, he took the town, razed the walls, and compelled her to adopt the Achaean laws. He was in his seventieth year and ill in bed when news was brought him that the Messenians had revolted from the League; he immediately rose and took command of the army. In the battle that ensued he was taken prisoner, and Deinocrates, the Messenian commander, sent him a cup of poisoned wine, which he drank. Consult: Plutarch's *Life of Philopœmen* (rev. ed., by A. H. Clough, in Everyman's Library, New York, 1910); also, E. A. Freeman, *History of Federal Government in Greece and Italy* (2d ed., ib., 1893); J. P. Mahaffy, *Alexander's Empire* (ib., 1898); R. Pöhlmann, *Grundriss der griechischen Geschichte* (5th ed., Munich, 1914).

PHILOSOPHER OF FERNEY. A title given to Voltaire, from the name of his residence in Switzerland, near Geneva.

PHILOSOPHER OF MALMESBURY. A title conferred on Thomas Hobbes, from the name of his birthplace.

PHILOSOPHER OF SANS-SOUCI, sän-sō'sé'. A title applied to Frederick the Great, from the name of his palace at Potsdam.

PHILOSOPHER OF WIMBLEDON. A name used of John Horne Tooke, from his residence in Surrey.

PHILOSOPHER'S STONE, THE. A mysterious compound to which was attributed the power of transmuting metals into gold or silver, the attempted making of which was the chief occupation of alchemists, at least during the Middle Ages. In reality it bore no resemblance to a stone. It was a panacea for human ills that was so eagerly sought, for, with the function of a universal solvent, it combined that of the elixir of life, a renewing influence on the body. The conception of the transmutation of metals was Oriental. The Arabs regarded metals as compounded of mercury and sulphur in varying proportions. To this was added a more philosophic conception of a common basis of all forms of matter, the "materia prima" of which Plato had written. Three forms of the philosopher's stone are mentioned—a red tincture transmuting metals into gold; the elixir vitæ, restoring youth and prolonging life; and a white tincture, changing metals into silver. Geber (q.v.) was the reputed author of the *Key of Wisdom*, a secret book on the philosopher's stone. The matter was generally shrouded in mystery, but Van Helmont asserted that he had seen and handled the stone, which was sulphur color, heavy, and brilliant as glass; Paracelsus described it as a solid, deep ruby in color, transparent, flexible, and as brittle as glass; Raymond Lully, again, described it as a carbuncle. After the thirteenth century a mystic and esoteric interpretation of the philosopher's stone seems to have been applied to morals, it bringing the wearer wisdom and virtue, and purifying the soul. Consult Carl Engler, *Der Stein der Weisen* (Karlsruhe, 1889), and Giano Lacinio, *The New Pearl of Great Price* (Eng. trans., London, 1894). See *ALCHEMY*.

PHILOSOPHICAL SOCIETY, AMERICAN. The oldest of American learned societies. Its official name is the American Philosophical Society Held at Philadelphia for Promoting Useful Knowledge. Its hall is No. 104 South Fifth Street, Philadelphia, in which are an

extensive and valuable library, many interesting portraits and busts, and a collection of relics, including the chair used by Jefferson while writing the Declaration of Independence. The society originated in 1727, as a club for mental improvement, in which Franklin formed most of his ingenious acquaintance, as he tells us in his Autobiography. On May 14, 1743, Benjamin Franklin conceived an idea of forming a society which should include members from all the Colonies, and to this end he published in Philadelphia *A Proposal for Promoting Useful Knowledge among the British Plantations in America*, and, though his suggestions were not acted upon immediately, he wrote, on April 5, 1744, that the society had been formed and held several meetings, with Thomas Hopkinson as president and himself as secretary. Within a few years regular meetings were discontinued from time to time until April 25, 1766, when it was reorganized as a society, and its name was changed to the American Society for Promoting Useful Knowledge. The American Philosophical Society renewed its activity in November, 1767, and the union of the two, being located in the same city and having the same objects, was suggested; but a year was spent in negotiation before the two became one on Jan. 2, 1769, adopting the present name and electing Benjamin Franklin president. The second president was David Rittenhouse, and he was succeeded by Thomas Jefferson. In 1785 John Hyacinthe de Magellan, of London, presented 200 guineas to the society for a perpetual fund, the interest each year to be put into a gold medal, to be given to the author of the best discovery or improvement in navigation, natural history, or astronomy. The Magellanic fund has always been kept as a separate investment, and its medal is considered a great honor in the scientific world. Membership in the society is limited to the election of 15 residents in any one year of the United States and of three foreign residents, and the honor of an election to membership is highly prized by American scientists. The society holds in April of every year a general meeting to which distinguished men of Europe are invited, and these assemblages are events of international interest. The published *Transactions* of the society begin in 1771, in which year a copy was given to each member of the General Assembly of Pennsylvania, with the statement that "the volume is wholly American in composition, printing, and paper." The society publishes also its *Proceedings*, beginning with the year 1838.

PHILOSOPHY (Lat. *philosophia*, from Gk. *philosophía*, love of knowledge, from *φιλεῖν*, *philein*, to love + *σοφία*, *sophia*, wisdom, from *σοφός*, *sophos*, wise). A term used originally, e.g., by Socrates, to mean devotion to the pursuit of truth. In Plato it came to mean knowledge of eternal reality. Aristotle employed the term sometimes as equivalent to critical systematized knowledge, sometimes as meaning the science of ultimate reality. The Stoics considered philosophy to be endeavor to obtain excellence (*ἀρετή*, *aretê*) in knowledge and in morality; the Epicureans regarded the philosopher as the man who pursued happiness in the manner suggested by reason. In the Middle Ages philosophy came to be ancillary to theology and in large measure the reasoned defense of divinely revealed truth. In modern times various definitions have been given, such as "rational knowl-

edge derived from concepts as such" (Kant), "the revision of the concepts" (Herbart), "the science of principles" (Ueberweg), "knowledge of the highest degree of generality" and "completely unified knowledge" (Spencer), "the totality (*Inbegriff*) of all scientific knowledge" (Paulsen), "the reduction of the general knowledge obtained by the special sciences to a complete system" (Wundt), and "man thinking, thinking about generalities rather than about particulars" (James); while some thinkers have despaired of the possibility of finding any definition that shall cover the whole field historically occupied by philosophical speculation. The conception of the task of philosophy necessarily changes with the course of time. At the beginning, before any special sciences had arisen, it was natural that the unity of knowledge should be insisted on and that the student should ambitiously take all knowledge for his province. But the scope of philosophy has gradually grown narrower as its original domain has been encroached upon by new sciences. The failure of philosophers of the present to agree on the definition of their work may be ascribed to the fact that so much territory has been already occupied by these sciences as to leave the proper domain of philosophy in doubt. These sciences have one and all been experimental in their method. To those who believe in the existence of a priori knowledge, a point of departure for delimiting philosophy from science is obtained in this distinction of the inductive from the deductive. But the belief in a priori knowledge is less current than it was a hundred years ago, and some other differentiation of philosophy from science must be undertaken by the inductivist. Perhaps no better plan can be adopted than that based upon the specialistic character of present-day science. Each science pursues its own investigations in its own limited field and will allow itself to be prejudiced as little as possible by what is done in other fields. But, after all, it is the same universe that furnishes object matter to all the separate sciences, and one would naturally expect that all the separate knowledges gained by specialists would articulate themselves into a coherent system of knowledge. The hope to accomplish this articulation in detail would be idle; but every science has its concepts, which it uses to organize the facts in its own little field. Do all the concepts tally? Are they compatible with one another? Questions of this sort are reasonable, and an attempt to answer them forms the so-called philosophy of nature, which may be defined as the correlation and criticism of scientific concepts. Among such concepts are those of matter, energy and its conservation, atom, ion, electron, life, evolution, differential, point, line, etc. The philosophy of nature is without doubt the most difficult branch of philosophy, as it demands for its prosecution considerable familiarity with the leading sciences. But while it is not to be hoped that any very brief and general treatment of the subject can be satisfactory, still more detailed work in the way of correlation and criticism of the conceptions employed in a few sciences can be reasonably expected. Such work has been done in English by J. B. Stallo in his *Concepts and Theories of Modern Physics* (London, 1882; new ed., New York, 1897), and by James Ward in his *Naturalism and Agnosticism* (London, 1899; new ed., 2 vols., New York, 1903).

Again, all the sciences take for granted that man can know something about the universe. What is this knowledge? Is it really valid, as it asserts? Is there any way of ascertaining its validity? A scientific treatment of these questions is called epistemology, or the theory of knowledge (q.v.), and it forms a second philosophical discipline. (See KNOWLEDGE, THEORY OF.) Still again, can any light be thrown on the ultimate nature of the reality either of the external world or of the mind? This is the problem of metaphysics (q.v.). Formerly logic, psychology, and ethics were considered as branches of philosophy, but the modern tendency is to establish them as separate sciences. This is accomplished, however, only in a restricted sense. At bottom the question whether this or that discipline is a science or a branch of philosophy is of no great importance, when it is recognized that there is no fundamental difference in method between science and philosophy, the only difference being one of degree, not of kind. The more abstract any systematic knowledge is, the narrower the field it appropriates to itself; the more it neglects other subjects lying outside of that field, so much the more properly is it called a special science. On the contrary, the more comprehensive such knowledge is, the more philosophical it is; for philosophy is an attempt as far as possible to know the world as a whole. As William James says, "philosophy must include the results of all the sciences and cannot be contrasted with the latter. It simply aims at making science what Herbert Spencer calls 'a system of completely united knowledge.' In the more modern sense, of something contrasted with the sciences, philosophy means 'metaphysics' The older sense is the more worthy sense, and as the results of the sciences get more available for coördination, and the conditions for finding truth in different kinds of questions get more methodically defined, we may hope that the term will revert to its original meaning. Science, metaphysics, and religion may then again form a single body of wisdom and lend each other mutual support."

The history of European philosophy is commonly divided into three main epochs, each characterized by a unique development, although at the same time the earlier periods furnish preface and starting point for those that succeed them, so that the whole development is continuous. The first of these periods is that of ancient or Greek philosophy (q.v.). It extends from the earliest formulations of philosophic conceptions among the Ionian philosophers and continues into the Christian era, throughout the dominance of paganism. While shared by other nations of antiquity besides the Greeks, as notably by certain Romans, Jews, and Græco-Egyptians, it received its form and lasting bent from the Greek mind, and its later influence proceeds almost exclusively from Athenian culture (See GREEK PHILOSOPHY.) The second period is that of mediæval philosophy, in which scholasticism (q.v.) was the dominant attitude. It had its rise in the theological speculations of the early Church fathers, usually educated in Greek thought, and was continued and developed throughout mediæval times as the characteristic philosophy of Catholic Christianity. It had its culmination in the great synthesis of Thomas Aquinas, but has never ceased to be the traditional philosophy of the

Church, and in modern times, as neoscholasticism, is the subject of an energetic revival. During the scholastic period in Christian Europe the tradition of Greek philosophy was kept alive by the Arabs in Spain (see ARABIC LANGUAGE AND LITERATURE), among whom were many important philosophical thinkers. The third period is known as the period of modern philosophy and is commonly dated from the Renaissance (q.v.) and more particularly from the advocacy of empirical methods of investigation by Bacon and of appeal to immediate reason or intuition by Descartes.

With the revival of learning there was also a revival of all the important philosophical systems of antiquity. Platonism flourished in the Academy of Florence and found its most important advocate in Ficino. Neo-Platonism blended with Neo-Pythagoreanism, which was represented by Pico della Mirandola. Aristotelianism renewed its vigor in the two rival schools of Averroism and Alexandrism, and among the Protestants in Melancthon. Skepticism was defended by Montaigne, Sanchez, and Charron; eclecticism, virulent in its opposition to scholasticism, was propagated by Valla, Vives, de la Ramée, and Zwingli, while scholasticism found its champion in Suárez. Natural philosophy, a rehabilitation of one phase of Aristotle's system, but blended with Neo-Platonic mysticism, was developed by Cardano, Campanella, and especially by Bruno. Paracelsus and Böhme elaborated the mystical side of this line of thought, while Galileo and Kepler remained more true to an empirical study of nature and formed the starting point of a mechanistic and materialistic conception of the universe. In Kepler, however, with his insistence on the harmony of the world order, we have a distinctively Pythagorean touch. Political philosophy took an entirely new start with Machiavelli, who threw aside the work of Aristotle and the authority of the Church and worked out a theory in which the state and civic freedom were all-important. But though the philosophers of the Renaissance thus bridged over the chasm that separated the ancient from the modern world of thought, it was reserved for Bacon and Descartes to lay the foundations of modern philosophy in empiricism on the one hand and in rationalism on the other: and from Kant's time one of the aims of philosophy has been to rear a superstructure which should rest on both these foundations. As was to be expected, the foundations had first to be laid independently, and as a result we have two great modern schools—one has defended the position that all secure knowledge rests on experience; the other has demanded that in all satisfactory knowledge the requirements of reason be met.

Modern empiricism came to articulate expression first in Francis Bacon, who insisted upon the abandonment of the deductive, *a priori* speculation of the schoolmen and upon the necessity of studying nature without bias. Hobbes followed Bacon in urging the necessity of a philosophy of experience: but being especially interested in human nature, and yet lacking the data for an inductive study of society, he allowed himself to construct society out of imaginary isolated human beings and to palm off this fiction for fact.

Modern rationalism began with Descartes, who is often called the father of modern philosophy. He likewise emphasized the necessity of begin-

ning anew, but, unlike Bacon, he looked to the inner nature of self-consciousness for the principles that can build up the structure and furnish the certainty of knowledge. The Cartesian system is rationalistic; the method for advancing our knowledge was thought to consist in letting the light of reason shine forth. This was accomplished by the application of mathematical method to metaphysics, with the result of bringing out the innate truths and principles of reason. In this way we become assured, so Descartes argued, of our own existence, of the existence of God, and of that of the material universe. Descartes sharply separated mind and matter: mind is thinking, unextended substance; matter is unconscious, extended substance. Two great problems are therefore handed down to his immediate followers. What is the relation between mind and matter in general, and the soul and body in particular? And what is the relation between the soul and God? Geulincx, the founder of Occasionalism (q.v.), answers the former question by saying that God acts in the individual, intervening on each occasion to maintain the harmony between mind and body. God is the real subject of human acts, the individual being but a nominal subject. The second problem is taken up by Malebranche, who maintains that the individual thinks in God. The individual is nothing but the mode of God's being. The mind is in God and in Him views everything in its eternal significance. Spinoza carries out Cartesianism to its logical conclusion. Substance is that which exists independently. Hence the infinite alone, God, is true substance. Mind and matter are two attributes of the one divine substance. They are known to us as the parallel manifestations of the hidden substantial identity in God. Spinoza develops his system by pure deductive reasoning, following the procedure of geometrical demonstrations. He thus exhibits the ideal method of rationalism, which regards reason, working solely on its own inner principles, as capable of discovering the true nature of reality. The moral and physical parts of the universe follow from these principles with the same rigid necessity as the *demonstranda* of geometry follow from its axioms. Joyful resignation to this rationalistic determinism is the essence of morality. Spinozism reduces the dualism of mind and matter to a common principle and thus develops a pantheistic monism (q.v.) Leibnitz endeavors to solve the paradox of Spinozism that unextended and extended substances are ultimately identical. As a rationalist he sides with Spinoza; as an individualist he sides with Locke. Leibnitz's substance is not that which *exists* through itself, but rather that which *acts* through itself. Reality consists of an infinite number of monads (see MONAD), which are unextended, spiritual activities, centres of original forces, or *formal atoms*. Each atom is self-contained and cannot be modified from without. Spinoza surrenders the reality of individuals to the principle of unity. This unity Leibnitz breaks up into a plurality of independent, self-active monads. But the multiplicity is synthesized by the Leibnitzian principle of continuity and the law of preestablished harmony (q.v.). All the monads belong to an organized system, and each mirrors or represents the universe. The individuals are not isolated, but belong to an organic whole. God, the supreme monad, is pure activity, while

finite monads are in a state of imperfect realization. They are not completely active. It is the passivity of finite monads that gives rise to confused perceptions, in which consists the appearance of an extended, material world. These fundamental principles of Leibnitz's system are modified by his follower, Wolff, who adopted merely the rationalistic method of his master and reduced philosophy once more to scholastic form. This was the culmination of dogmatic rationalism on the Continent.

In the meantime the empiricism begun by Bacon and the rationalism begun by Descartes became curiously intermixed in Locke's theory of knowledge. Locke supported the Baconian appeal to experience. The sole sources of our knowledge are empirical facts, since the mind has no innate ideas. All the materials of knowledge are externally impressed upon the mind, the sole activity of which consists in linking together the given ideas. Upon this sensationalistic basis, however, Locke built up a rationalistic ideal of knowledge. We attain certainty in our intuitive knowledge of the existence of the self, and in the demonstrative knowledge of the existence of God, and of mathematical and moral truths as well. Our knowledge of the external world, being dependent on sense perception, reaches only the level of probability. In this Locke violated his own fundamental principle that our knowledge extends no further than our sensationally given ideas, and that truth consists in the agreement of ideas among themselves, not in their correspondence with things or external reality. Berkeley took Locke's definition of knowledge in a strict sense and insisted that we never get beyond the circle of our own ideas. We know nothing about the agreement of our subjective ideas with external things. All knowledge, he contended, is purely individual, and all ideas are merely particular. The mistaken belief in the existence of an external material object is attributable to the confusion of taking an abstract or general name as representative of a real thing. The reality of sense objects consists in their being perceived. The assumption of an object apart from the idea is as useless as its existence would be. Ideas signify nothing but modifications of the conscious subject. Hume carried empiricism to its inevitable logical consequence. Nothing is knowable, he argued, but conscious experiences—"impressions" and their copies, "ideas." These we cannot transcend. Ideas are externally connected by "gentle forces," called relations or associations. We cannot prove the existence of God, of the self, of matter, or of cause. All these are fictions of the imagination and have no basis in actual experience. Thus, step by step, empiricism ends in skepticism.

Kant, the founder of the critical philosophy, consciously and critically attempted what Locke had naively achieved: the arbitration of the controversy between empiricism and rationalism. His decision was that rationalism is right in its determination of scientific method; empiricism, in limiting scientific knowledge to the sphere of possible experience or phenomena. Knowledge, he maintained, is a joint product of two factors—one furnished by the conscious subject, the other given in the raw material of sensation. The former is *a priori*; it antedates experience and is the condition that makes experience possible. The latter is *a posteriori*, given from

without. The *a priori* would be devoid of content without the sensible material; the *a posteriori* would be nothing at all were it not shaped and transfigured in the mold of consciousness. Theoretical reason may not transcend the bounded domain of experience, but practical reason postulates as morally necessary a world of transcendent reality, in which moral order is the fundamental law. God, freedom, and immortality, though undemonstrable, are the necessary presuppositions of our moral being. Thus reason gives way to faith. Fichte, starting from a Kantian basis, objected to Kant's failure to show how the *a priori* principles of consciousness are necessarily involved in the nature of consciousness, as well as to the Kantian separation of the phenomenal world and the real world of things in themselves. By exhibiting the process in which consciousness unfolds itself, we see that the phenomenal world is meaningless unless organically connected with its intelligible essence. Knowledge is neither in whole (Hume) nor in part (Kant) the product of sensation. It is the creation of the ego. Voluntary selves freely choose to assert themselves and thus construct their whole organized world. The moral law is the prior condition of all we theoretically know, and the outer world exists simply for the sake of our moral self-realization. The speculative method, the exhibition of the progressive nature of consciousness, is the only possible method, since knowing does not begin with facts passively received by the ego, but with a spontaneous act of the ego's creative energy. Jacobi also objected to the Kantian separation between the thing in itself and the phenomenal world. Without the thing in itself, he said, no one can enter the Kantian system, and with it no one can remain in that system. The only solution of this antinomy was to exalt faith, to which even Kant had recourse, to the supreme place in philosophy. Not knowledge, but feeling, is the organon whereby we can attain certainty of reality. Thus results a philosophy of supernatural sensualism. Schelling reached much the same result, but by a different method. He regarded the world as the embodiment of intelligence, an objective fact, indeed, but one that exhibits in its progressive forms the same principle that is found in man. But the character of that absolute principle which thus manifests itself in external nature and in man cannot be apprehended by reason. Intuition alone brings us into contact with ultimate reality. In Hegel German rationalism vigorously reasserted itself: the real is the rational, and the rational is the real. All reality is but a manifestation of reason. The world is a development of thought. But thought and reason are not abstractions. The word "thought" is used with a width of meaning that includes in it the concrete content of the world of sense organized into an all-inclusive universe. The life and stir of the universe is the life of thought. The development of this concrete thought is a dialectical development; hence philosophy must employ the dialectical method to exhibit the nature of reality. The motive force of this development is opposition and negation. Everything is what it is by virtue of what it is not, i.e., by virtue of its relation to other things. These various things taken apart are self-contradictory; only when seen in their interconnection are they seen to be real. The contradictories are not annulled in their mu-

tual relations; they are conserved, but thus conserved no longer are they contradictory. The tracing of this process of negation is the Hegelian dialectic. With the death of Hegel, Hegelianism broke up into warring schools and became utterly discounted in Germany, only to be resuscitated later in England and America in the so-called Neo-Hegelian school.

Schleiermacher took up the philosophical problem where Fichte, Schelling, and Jacobi had left it. He agreed with Jacobi that thought cannot grasp the essence of reality; hence philosophy is not a complete science; but while it is not complete, it is ever growing and reaching out towards the goal of the identity of thought and being. This goal, however, can be reached only in religion, the communion of the finite with the infinite upon which it feels itself dependent. In Herbert and Schopenhauer there is a twofold opposition to Hegelianism: the former opposed his doctrine of real qualities to Hegel's idealism; the latter directed his pessimism (q.v.) against the idealistic estimate of the value of existence and maintained that the real is an irrational principle of blind impulse. Beneke attempted to synthesize the results of previous philosophical activity by developing a psychological philosophy, based on inner experience. Self-consciousness reveals directly to us the psychic constitution of man; sensation is only mediate knowledge of the outer world, which must be interpreted after the analogy of psychic life. Lotze combined the Hegelian and Herbartian positions, while Hartmann aimed at a synthesis of Schopenhauer and Hegel. Among recent German thinkers the cry of "Back to Kant" has been especially prominent; this Neo-Kantianism has been represented by such men as F. A. Lange, Hermann Cohen, J. I. Volkelt, Alois Riehl, and Friedrich Paulsen. Another recent vigorous German school is that of the so-called immanent philosophy of W. Schuppe, Johannes Rehmke, and Richard von Schubert-Soldern, who deny the antithesis of idea and object and assert an identical unitary consciousness in all beings. The immanent content of this consciousness is the world of space and time. Allied to this immanent philosophy is the empiriocriticism of Richard Avenarius, who, like Schuppe, begins, not with the opposition of subject and object, but with the pure experience of the unsophisticated man free of all preconceived theory. In this experience the so-called object of consciousness is an integral part, and of this experience philosophy is an exact description. Materialism had a temporary revival in the middle of the nineteenth century in Germany; its champions were Karl Vogt, Rudolf Wagner, Jacob Moleschott, F. K. C. Ludwig, Büchner, Czołbe, and perhaps, later, E. K. Dühring. Sometimes identified with materialism is the monism of Haeckel, who, however, is not a materialist but an animist, holding all matter to be instinct with life; but inasmuch as the material, not the conscious, side of being is emphasized, the doctrine is closely allied to materialism. Fechner had some years before Haeckel advocated an animism, which, however, had emphasized the conscious side of being. Wundt's philosophy is related to Fechner's, inasmuch as he holds that the mechanical universe is "the outer wrapper behind which is hidden a spiritual creative activity, a striving, feeling, sensing, like that which we experience in ourselves." Holding

that conation is the most fundamental essence of this activity, his view is voluntaristic. Another influential voluntarist, Nietzsche, holds that ultimate reality is will to power and that thought is only a means which some wills to power develop and use to secure more power. In contrast to these movements we have a new inspirational idealism of which Rudolf Eucken and Heinrich Rickert are the protagonists.

Returning now to French philosophy, we may say that after the time of Descartes the most influential thinkers in France were Rousseau and Comte. Deserving of mention are Bayle, the skeptic; Voltaire, more positive in his attitude and with a leaning towards mechanism; La Mettrie and Condillac, sensationalists; La Rochefoucauld and Helvétius, egoists; Bonnet, a rationalistic sensationalist; Diderot and D'Alembert, pantheists. The last three, along with minor thinkers, are known as the Encyclopædists, because of their coöperation in the issue of the great *Encyclopédie*. During the French Revolution the predominant philosophy was sensationalism, going under the name of ideology, given it by Destutt de Tracy. Cabanis emphasized the physiological basis of sensationalism; a little later Maine de Biran, starting with the psychological fact of self-consciousness, reached a view similar to Beneke's, in which the spiritual nature of self-activity received recognition. He was thus the forerunner of spiritualism (q.v.), which was championed by Jouffroy and Royer-Collard and had in Cousin its most prominent exponent. Spiritualism lived through the nineteenth century, being later represented by Ravaisson, Secrétan, and Vacherot. Opposed to ideology were the traditionalists, who, while reaching spiritualistic results, were hostile to the method of the spiritualists. Accepting the Catholic doctrines as unimpeachable, they emphasized the supremacy of faith above reason. Reason inaugurated the Reformation and issued in the Revolution; it is the source of nothing but evil. Faith resting on inspired authority is alone able to reach the truth. So wrote De Maistre, Frayssinous, and Bonald. But reason would not down, and turned its attention to the social nature and relations of human beings. Saint-Simon, the founder of the French Socialistic school, was not himself so much a philosopher as a reformer; he practiced rather than theorized, but he interested many speculative minds in social problems. The greatest of his disciples was Auguste Comte. Comte contended that the only true and final philosophy is positive; true philosophy is an accurate description of facts and their experienced relations. He brushed aside all pretense of knowledge of anything more ultimate than the phenomena of existence. Positivism, however, according to Comte, is only the third stage of philosophical reflection. Man's first attitude towards nature was theological; he attempted to explain phenomena by referring them to supernatural powers. Then man became metaphysical, using abstract conceptions, like force, as principles of explanation. Finally, as the third stage, came positivism, the insight into the futility of previous explanations, and the recognition of facts and their relations as philosophical ultimates. About the middle of the nineteenth century, in protest against Comte, a revival of Platonism occurred in certain Catholic circles: Cartuyvels, Hugouin, and Gratry maintained that ideas are modes of God's es

sence. Positivism passed over into agnosticism in Littré, Taine, and Renan. With the development of experimental psychology a psychological philosophy has been cultivated by Ribot, Delboeuf, and Bernard. After Darwin's *Origin of Species* appeared, evolutionism was eagerly taken up by French thinkers, chief among whom have been Fouillée, Guyau, and Bergson. Bergson maintains that current doctrines of evolution err in regarding the future as determined whether by mechanical laws or by purpose. The development of life always, on the contrary, brings something new and incalculable. Against the determinism (q.v.) of positivism, psychologism, and evolutionism Boutroux likewise advocates a philosophy of contingency and freedom. But Kantian principles maintained their ground in the philosophy of Renouvier and his followers. Lachelier attempted a combination of Kantianism and spiritualism.

Since Bruno's time Italy has made little original contribution to philosophy, although she can boast of many brilliant expositors of already existing systems. Vico and Beccaria can lay the best claim to originality, both working in the realm of the philosophy of law. Genovesi, the empiricist; Galluppi, the sensationalist; Rosmini and Gioberti, objective idealists; Mamiani, a modified Platonist; Vera and Spaventa, Hegelians; Testa and Cantoni, Kantians; Villari and Dominici, positivists; and Bonavino, Thomist—deserve passing mention. Giovanni Papini champions a very radical form of pragmatism, while Benedetto Croce is giving vogue to a revival of Hegelianism.

For the last two centuries Great Britain has shared with Germany the honor of having distinctive national philosophies. English thought has been predominantly empiricist and associationistic until the last half century. Hartley gave associationism (see ASSOCIATION OF IDEAS) its modern form, and James Mill applied it to all the life of mind. John Stuart Mill, known by his utilitarianism (q.v.), did his greatest philosophic work in logic. True to empiricism, he introduced induction into the place it now occupies in logical theory, and yet he builded better than he knew. His empiricism did not furnish an adequate basis for his logic, and subsequent logicians, such as Sigwart in Germany and Bosanquet in England, have succeeded in effecting a reconciliation between empiricism and rationalism in logic; but this they could not have done without Mill's pioneer work. Bain did little more than follow in Mill's footsteps. Darwin's great discovery has been extremely fruitful in philosophy. Spencer has worked out an evolutionary philosophy in elaborate detail, but with a strong individualistic bias. It is, however, marred by a lack of historic perspective. Lewes represented positivism; Martineau has been the most prominent advocate of intuitionism (q.v.), applying intuitionistic principles especially to ethics and theology. Green, Bradley, and Bosanquet, under the influence of German idealism, have sought to stem the tide of empiricism. Ward, from a psychological starting point, has likewise reached an idealistic result. Under the leadership of these men and of the two Cairds, of Scotland, English philosophy had, in the last decades of the nineteenth century, almost left its empiricist moorings. Bertrand Russell, in addition to much other very important work, publishes voluminously on the philosophy of mathematics,

F. C. S. Schiller became known as a militant pragmatist, and H. Wildon Carr as a Bergsonian. The two journals *Mind* and the *Hibbert Review* serve to support a lively philosophic interest.

The typical philosophy of Scotland since the time of Hume has been intuitionism. Hutcheson may be regarded as its founder. Reid and Stewart gave it classical expression. This Scottish thought was a protest against the Lockean doctrine that knowledge is only a correspondence between ideas and stoutly maintained that we have immediate knowledge of objective reality. Hamilton, in his natural realism, sought to reconcile intuitionism with Kantianism. The two Cairds and Stirling broke away from the intuitionistic tradition and gave Hegelianism a vogue which makes it rival intuitionism in Scotland and empiricism in England.

In the United States the greatest original philosopher was Jonathan Edwards, who, starting from Lockean premises, elaborated under Calvinistic influences a most uncompromising determinism (q.v.). Franklin, while not technically a philosopher, gave an impetus towards empiricism. Witherspoon and McCosh brought strong support to Scottish intuitionism, also taught by Upham and Wayland. Among the educators who early aroused interest in philosophy were Noah Porter, Mark Hopkins, and Daniel Coit Gilman. Laurens P. Hickok was mildly Kantian, Francis Bowen eclectic, B. P. Bowne and G. T. Ladd Lotzeans. The Concord School of Philosophy, headed by Emerson, popularized German idealism, which was strongly defended technically by W. T. Harris; while Josiah Royce gave it a more independent and original statement. James E. Creighton defends a more personalistic form of idealism. William James, a brilliant advocate of empiricism, sought to rescue philosophy from agnosticism by asserting the right of a will to believe in face of doubt; he may be considered the founder of pragmatism (q.v.), although, with characteristic modesty, James himself gives this honor to C. S. Peirce. By his development of pragmatism and radical empiricism, as well as by his great work in psychology, James won for himself recognition as one of the great leaders of the thought of his age. In his work he was ably and independently supported by John Dewey, who gave a more systematic treatment to pragmatistic logic than James was able to give in his more popular writings; and he likewise did notable work in ethics. Two of Dewey's prominent supporters were George H. Mead and Addison W. Moore. George Santayana worked out, in popular rather than in technical form, a philosophy in which mechanism is regarded as the efficient principle of the universe, which ineffective mind appreciates, thus giving value to what has not come about by its agency. In the earlier years of the twentieth century another movement, commonly known as the new realism, gained headway. In large measure a development of one of the factors in James's thought, it found expression in James's pupils, E. B. Holt, R. B. Perry, W. B. Pitkin, and W. P. Montague, but others worked independently in the same field, among them G. S. Fullerton and E. B. McGilvary. F. J. E. Woodbridge is both realist and pragmatist, as indeed are many other realists. A. O. Lovejoy developed temporalism (q.v.). Frank Thilly published as his most important work a history of philosophy, and Fullerton's keenly critical

studies in epistemology are of special importance. Exceedingly important factors in the promotion of recent philosophical thought have been these periodicals: the *Philosophical Review*, the *Journal of Philosophy, Psychology, and Scientific Methods*, the *International Journal of Ethics*, and the *Monist*.

In general, within a century the significance of the history of philosophy has been brought out by a long line of writers beginning with Hegel. The result is an appreciation of the continuity of philosophic development and of the genuine advance made by thought in this field.

PHILOSOPHY, MORAL. See ETHICS.

PHILOSOPHY OF THE ENLIGHTENMENT. See ENLIGHTENMENT, PHILOSOPHY OF THE.

PHILOSTRATUS (Lat., from Gk. Φιλόστρατος). The name of four sophists of the Roman Imperial period. According to Suidas the first three were all natives of the island of Lemnos. 1. The first PHILOSTRATUS lived in Nero's reign (54-68 A.D.). The only extant work of his is the dialogue *Vero*, a conversation between the Lemnian Menecrates and the banished philosopher Musonius Rufus on the Emperor's proposed canal across the Isthmus of Corinth and on his great cruelty. 2. FLAVIUS PHILOSTRATUS flourished under Septimius Severus (193-211 A.D.) and his successors. At the request of the Empress Julia Domna he wrote a remarkable *Life of Apollonius of Tyana*, in which he laid especial stress on the miracles ascribed to this pagan saint. The work was used later to oppose the teachings of the Christians. It has been translated into English by J. S. Phillimore (2 vols., Oxford, 1912) and by F. C. Conybeare (2 vols., London and New York, 1912). The same Philostratus is the author of the extant *Lives of the Sophists*, written soon after 229 A.D. 3. The third PHILOSTRATUS, son of Nervianus and son-in-law of Flavius Philostratus, was a young man in the reign of Caracalla (211-217 A.D.). He composed a work entitled *Imagines* (Εἰκόνες), which is still extant and describes 64 paintings in Naples. 4. The last PHILOSTRATUS was a grandson on his mother's side of the third Philostratus. He also wrote an *Imagines*, after the manner of his grandfather's book. This work is inferior to its model and in its present form breaks off in the description of the seventeenth painting. The

Imagines of the third Philostratus at least have now been proved to be descriptions of actual works of art and so are of great value to the archaeologist. The dialogue *Heroicus* probably belongs to the third sophist, while the second apparently was the author of the interesting collection of *Letters*. The standard edition of all these works is by Kayser in the Teubner collection (2 vols., Leipzig, 1849). The *Imagines* of the third Philostratus have been separately edited by the members of the Vienna Classical Seminary (Leipzig, 1893). Consult J. S. Phillimore, translation of Philostratus, vol. i, pp. xxxiv-xlv (Oxford, 1912), and Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

PHILO'TAS (Lat., from Gk. Φιλώτας). A Macedonian general. See PARMENION.

PHILOXENIAN (fil'ók-sē'nian). **VERSION.** See BIBLE, *Text of the New Testament*.

PHILOXENUS (Lat., from Gk. Φιλόξενος) (435-380 B.C.). A famous dithyrambic poet, born in Cythera. When the Spartans recaptured the island from the Athenians, probably after the Sicilian expedition, he became a slave. Eventually he passed into the hands of the poet Melanippides, who, attracted by his talent, educated and freed him. He lived some time at the court of the elder Dionysius in Syracuse. There he forfeited the tyrant's friendship either on account of his frank criticism of his patron's verses or because of his love for a beautiful flute player, Galatea, the mistress of Dionysius, and was imprisoned in the quarries. Philoxenus subsequently took vengeance on Dionysius, who was blind in one eye, by composing the most famous of his dithyrambs, *The Cyclops*, in which he represented himself as Odysseus winning from the Cyclops the affections of his sweetheart, the nymph Galatea. This was the model for Theocritus' eleventh idyl. After leaving Syracuse Philoxenus lived at Tarentum and later in Greece and died at Ephesus. He wrote 24 dithyrambs in all, which were greatly admired in antiquity. Of these only insignificant fragments remain. The poem entitled *The Banquet* (Δείπνον), of which much is extant, is generally ascribed to this Philoxenus; but some considered it as the work of a Philoxenus of Leucas. The fragments are published by Bergk, *Poetae Lyrici Graeci*, vol. iii (Leipzig, 1882; reprinted, 1914).

PHILTER, or **PHILTRE** (Lat. *philtrum*, from Gk. φίλτρον, *philttron*, φιλητρον, *philetron*, love charm, from φίλειν, *philein*, to love). An artificial means of inspiring and securing love. A belief in such charms seems to have been generally prevalent from an early day. Among the Greeks and the Romans (among the latter in the later days of the Republic and under the emperors) love charms, and especially love potions, were in continual use. Probably certain poisonous or deleterious herbs and drugs were among their chief ingredients, to which it is said that other substances, animal as well as vegetable, were added, besides the employment of magic rites. Thessaly was famous for producing the most potent herbs, and her people were regarded as the most skillful practitioners of magic arts, whence the well-known *Thessala philtra* of Juvenal (vi, 610). These potions were violent and dangerous, sometimes producing madness and death instead of merely serving the purpose for which they were intended. The use of philters seems to have been not unknown during

the Middle Ages, and in the East belief in the power of love potions has never died out.

PHINEAS (fin'ées) **FINN**, THE IRISH MEMBER. A novel by Anthony Trollope (1869). It is the first of a series of political tales, *Phineas Redux*, *The Prime Minister*, and *The Duke's Children*, in which Finn and most of the characters of the story reappear.

PHINEUS, fin'és-ús or finús (Lat., from Gk. Φινεύς). A blind soothsayer, the son of Agenor, and King of Salmydessus in Thrace. Because of his cruelty to his children by his first wife, when his second wife accused them falsely, he was punished with blindness and was tormented by the Harpies, who seized or defiled all the food placed before him. He was delivered from the monsters by Zetes and Calais, the sons of Boreas, and in return directed the Argonauts in their expedition. Some of the traditions represent him as having been slain by Heracles or by Boreas.

PHIN'TIAS (Lat., from Gk. Φιντίας). A friend of Damon. See DAMON AND PHINTIAS.

PHIPPS, CONSTANTINE HENRY. See NORMANBY, C. H. PHIPPS, MARQUIS OF.

PHIPPS, CONSTANTINE JOHN. See MULGRAVE, C. J. P., second BARON.

PHIPPS, HENRY (1839-). An American steel manufacturer and financier, born in Philadelphia, Pa. He was educated in the public schools of Allegheny City. Five years after he had begun (1856) as office boy for a Pittsburgh firm, he became the partner of one of his quondam employers in a distributing agency for the Du Pont Powder Company, at this time he was also part owner of a small iron mill. His success in these ventures led to his association with Andrew Carnegie and to his becoming eventually, next to Carnegie, the largest stockholder in the Carnegie Steel Company. On the organization of the United Steel Corporation, in 1901, Phipps became one of the directors of that concern and shared in the enormous profits which the original stockowners of the Carnegie Company derived from the transaction. A multimillionaire, Phipps now devoted much money and time to philanthropic and artistic undertakings. He contributed large sums to aid in the treatment and elimination of tuberculosis in Philadelphia and other cities, and also gave \$1,000,000 to the University of Pennsylvania for the endowment of the Phipps Institute. He also built a psychiatric clinic for Johns Hopkins Hospital, Baltimore.

PHIPPS PSYCHIATRIC CLINIC. An institution established in 1913 for the study and treatment of mental diseases, a part of the Johns Hopkins University (q.v.). The clinic was intended by its founder, Henry Phipps, to provide for "the better care of patients suffering from mental diseases, especially in the earlier and often curable stage, under conditions similar to those of a general hospital." Besides an ambulatory service there are accommodations for 100 hospital cases. The institution is equipped with every device for the investigation, study, and treatment of neuropathic patients, has well-appointed laboratories, and provides for the higher education and training of graduate physicians, students, and nurses in this special branch of medicine. In the hospital itself the latest methods of hydrotherapy and mechanotherapy are utilized, together with the scientific application of recreation, occupation, music, etc., in suitable cases. Provision is made

also for the supervision of patients at their homes. The director is Dr. Adolf Meyer.

PHIPS, or PHIPPS, SIR WILLIAM (1651-95). The first royal Governor of Massachusetts. He was born at a border settlement, since called Woolwich, on the Kennebec River in Maine, and was one of a family of 26 children, all of the same mother. Till 18 years of age he was employed in keeping sheep, but, dissatisfied with this occupation, he became a ship carpenter and removed to Boston. There he learned to read and write and also married a widow with some property. Some years later he conceived the idea of fishing up treasure stored in a Spanish galleon that had been wrecked 50 years before in the West Indies. The English Admiralty fell in with this plan and gave him command of a frigate, but after a long search he returned unsuccessful. A little later he was sent out again in a vessel provided by the Duke of Albemarle and others. This time he found a wreck and took from it treasure to the value of about £300,000. As a reward for his success he received as his share £16,000, the honor of knighthood, and the appointment as sheriff of New England. In 1690 he was sent by Massachusetts with a fleet of eight vessels against the French settlement of Port Royal (now Annapolis in Nova Scotia) in Acadia and succeeded in capturing it. Later in the same year he commanded a larger expedition, consisting of 34 vessels and more than 2000 men, against Quebec. So active, however, were the French under Count Frontenac that the attempt failed, and on the way back to Boston nine of the vessels were wrecked. In 1692, through the influence of Increase Mather (q.v.), the agent of the Colony in England, Phips was appointed Governor of Massachusetts under the new charter. One of his first official acts was to commission a special court for the trial of those accused of witchcraft, but some months later he suspended its sittings. As Governor he displayed many of the bluff and choleric traits of a sea captain; among other things he cudgelled Brinton, the collector of the port of Boston, and caned Captain Short of the royal navy. In 1694 he was summoned to England to answer complaints made against him and while there died suddenly of a malignant fever. Phips was a man of great energy and determination, but possessed no remarkable intellectual capacity, and he appears to have been strictly honest in his private dealings, though he deemed it no sin to steal from Frenchmen. There is a curious life of him in Cotton Mather's *Magnalia* (London, 1702), but more trustworthy is that by Francis Bowen in vol. vii of the first series of Sparks's *American Biography* (New York, 1834-37). Consult also: Thomas Hutchinson, *History of Massachusetts Bay* (Boston, 1764-67, and London, 1828); Ernest Myrand, *Sir William Phipps devant Québec, 1690* (Quebec, 1893); Francis Parkman, "Count Frontenac and New France under Louis XIV," in *France and England in North America*, part v (Boston, 1903).

PHIZ. See BROWNE, HABLOT KNIGHT.

PHLEBITIS, flē-bī'tis (Neo-Lat., from Gk. φλέψ, *phleps*, vein), or INFLAMMATION OF THE VEINS. Although seldom an original or idiopathic disease, it is a frequent sequel of wounds, in which case it is termed traumatic phlebitis, and is not uncommon after childbirth. (See PHLEGMA'SIA ALBA DOLENS.) It commonly arises by the extension of an inflammation from

contiguous structures, as in phlegmonous erysipelas or cellulitis, or by the plugging up of a vein by an infective embolus. If severe the disease begins with a chill or chilly sensations and a rise in temperature. There is great tenderness and pain along the course of the affected vessel, which feels like a hard knotted cord, and if superficial may be rolled under the fingers. If the vessel is small the consequences of its obstruction may be of little importance, but when a large vein is affected the consequences are always dangerous and may be fatal.

Phlebitis may terminate in one of several ways. The most favorable is by simple resolution—the clot is absorbed, the vein becomes permeable, and circulation is reestablished. In other cases organization of the clot takes place, little blood vessels growing into it, from the walls of the vein, the whole finally becoming a fibrous cord. The circulating blood is diverted to other channels, which gradually dilate to accommodate the increased flow. Again, the clot may become infected, if it is not so from the beginning, undergo purulent softening, and the pus either be discharged by the formation of abscesses or be emptied into the blood current to be carried by the general circulation to all parts of the body. These purulent particles find lodgment in the large viscera, such as the liver, spleen, kidneys, and give rise to multiple abscesses. In the liver this frequently happens from inflammation of the portal veins. This general distribution of septic material is known as pyæmia (q.v.). An organized clot may in rare instances become calcified by the deposition in it of lime salts and form a phlebolite or vein-stone (q.v.).

The treatment of phlebitis comprises rest in bed, elevation of the part, and the local application of antiphlogistics—lead water and opium at first, hot fomentations later. If abscesses form they must be opened and drained. In certain cases it is possible to ligate the vein above and below the clot, open the vessel, and wash out the purulent material. The internal treatment varies with the symptoms, but in general must be stimulating.

PHLEBOLITE (from Gk. φλέψ, *phleps*, vein + λίθος, *lithos*, stone). A calcareous concretion formed by the degeneration of coagulations in veins and therefore also called vein-stone. It is not infrequently to be felt as a nodule, varying in size from a pinhead to a small bean, along the course of chronically inflamed veins of the lower extremity. Phlebolites sometimes attain considerable size.

PHLEBOTOMY. See BLEEDING; VENESECTION

PHLEGETHON, flēg'ē-thōn (Lat., from Gk. φλεγθων, from φλέγειν, *phlegein*, to burn). In Greek mythology, a river of the lower world, along with Acheron, Cocytus, and Styx (qq.v.). In Homer it unites with Acheron, as does Cocytus, a branch of the Styx. Later writers described its fiery torrent and its scorched and desolate shores.

PHLEGMA'SIA ALBA DOLENS. (Neo-Lat., painful white inflammation), or MILK LEG. A painful general swelling of a limb, due to the obstruction of the veins; a plastic phlebitis. It is due to thrombosis, which in turn may arise from pressure, general disease, or near-by septic processes. Milk leg occurs principally as an affection of women in childhood and occasionally in typhoid fever. The first symptom is a rise

of temperature, which might not attract attention at first. Severe pain first is felt, on the inside of the thigh, in the groin, and in the calf. The limb becomes swollen and oedematous, the skin white and shining or waxy. Blue veins may stand out prominently on the posterior part of the limb. Fibrinous coagula may be detached and carried along in the circulation to some other part, as the lung, forming embolism. This is the chief danger. One or both legs may be affected. The treatment consists of supporting the limb on a higher level than the trunk, punctiliously avoiding any jarring of it; maintenance of the recumbent position for at least a month; fomentations to the limb, which must be wrapped in the intervals in cotton; support of the heart with appropriate drugs; control of pain with analgesics and of insomnia with hypnotics. Suppuration and abscess may occur, in which case the pus must be evacuated. The greatest danger is from pulmonary embolism, which is almost invariably fatal. See PHLEBITIS.

PHLEGREAN PLAIN (Lat. *Phlegræi Campi*). A region west of Naples, embracing the volcanic plain on the Campanian coast from Cumæ to Capua. There legend placed the scene of the combats between the gods and the giants. The Romans filled it with palatial villas, and their poets celebrated its charm and productiveness. The volcanic disturbances to which the region has been subject have left of the magnificent buildings of the Romans only confused ruins, in part submerged under the sea.

PHLEGYAS, φλεγύας (Lat., from Gk. φλεγύας). The son of Ares and father of Ixion and Coronis. His daughter became by Apollo the mother of Æsculapius. Phlegyas was so incensed at her conduct that he set fire to the temple of Apollo, and for this was condemned to everlasting fear in Tartarus, where an overhanging rock threatened continually to fall on him.

PHLIUS, TIMON OF. See TIMON OF PHLIUS.

PHLOEM, phlō'ēm (from Gk. φλοῖς, *phlois*, bark), or BAST. One of the two regions of the vascular system, the other being called xylem (q.v.). Every vascular strand (bundle) consists of phloem and xylem, which are variously related in position to each other. The phloem is characterized by sieve vessels, and in ordinary trees it is external to the xylem (wood) and therefore forms the innermost fibrous region of ordinary bark. These bark fibres were called bast. See BARK; CAMBIUM; CONDUCTION; STEM.

PHLOGISTON. See CHEMISTRY, *History*

PHLOGOPITE (from Gk. φλογώψ, *phlogōps*, flaming red, from φλόξ, *phlox*, flame + ὤψ, *ōps*, face). A magnesium mica, similar to biotite, but differing from it in composition by usually containing fluorine and less iron. It crystallizes in the monoclinic system, has a pearly lustre, and is usually of a light yellow deepening to brown and red. The phlogopite occurs in serpentine rocks and frequently in association with limestone or dolomite. Phlogopite often exhibits asterism, especially when seen by transmitted light, as when a candle flame is viewed through a thin sheet. This property has been shown to be caused by minute needle-like inclusions arranged chiefly in the direction of the rays of the pressure figure, producing a distinct six-rayed star. Phlogopite is found in Finland, Sweden, Switzerland, and in the United States at various localities in New York, New Jersey, and also in Canada.

PHLOX (Lat., from Gk. φλόξ, sort of flower, flame, from φλέγειν, *phlegein*, to burn; connected with Lat. *flagrare*, to burn, Skt. *bhraj*, to shine brightly). A genus of mostly tall, erect, spreading perennial herbs belonging to the family Polemoniaceæ, natives of North America. The

CULTIVATED FORM OF MOSS PINK (*Phlox subulata*).

species, nearly all of which have a wide natural distribution within the United States, have entire leaves and usually very showy flowers, either solitary or in terminal clusters. Owing to their hardiness, easy cultivation, and the size and beauty of their flowers, many hybrid varieties with single and double flowers, in a variety of colors, forms, markings, and a long period of bloom, and a few of the pure species, are grown in gardens, being well adapted for planting on rockeries and in borders and groups. The best-known annual species of this genus is *Phlox drummondii*, a native of Texas, from which all annual phloxes now in cultivation have been derived. *Phlox pilosa* is a somewhat variable species, which flowers from May to August. *Phlox reptans* is native to the Alleghany Mountains. *Phlox stellaria*, native on river cliffs in Illinois, Kentucky, and Tennessee, is much prized as an ornamental plant on account of its numerous white flowers. The ground or moss pink commonly grown in gardens is *Phlox subulata*, which grows wild in rocky and sandy places in the eastern United States. The wild sweet William (*Phlox divaricata*), which prefers rich woods, has pale-lilac or bluish flowers, appearing in spring and in early summer. All species of phlox grow readily in ordinary rich soil; the annuals from seeds and the perennials from seeds, division of the stools, or cuttings of the stems and roots. The seeds are sown early in the spring, given gentle heat, and after the seedlings are large enough they are transplanted, hardened under glass, and later set out in the open. The stem cuttings are made in summer and are placed in fine sandy soil under cold frames or in greenhouses. The root cuttings, when slightly covered with soil and placed in gentle heat, sprout readily. After the cuttings have rooted they may be treated like the seedlings.

PHOBIA. See AGORAPHOBIA; INSANITY, *Borderland and Episodic States*.

PHOCÆA (Lat., from Gk. Φώκαια). The northernmost of the Ionian cities of Asia Minor, about 20 miles northwest of Smyrna, between two harbors, Naustathmus and Lamptra (Map: Greece, Ancient, E 2). It was said to have been originally settled by Phocians. It was included in the Ionian confederacy and was one of the most flourishing and powerful of the Asiatic Greek cities. Its sailors were famous for the daring with which they pushed their vessels into the western seas. The westernmost colony of the

Phocians was in Menaca in Spain, and they were on terms of close friendship with Arganthionus, King of Tartessus. Their most famous colony, however, was Massilia (Marseilles). Unable to defend themselves against Harpagus, a general of Cyrus, they abandoned their city and sailed to Chios (c.540 B.C.). Part of them subsequently decided to return and accept the Persian rule, but the majority sailed to Corsica and settled in Alalia. Though attacked by the Carthaginians and the Etruscans, who resented Greek entrance upon these lands, they were victorious in a great naval battle, but thought it wiser to abandon their settlement and move to southern Italy, where they founded Hyele or Elea (Velia). Phocæa seems to have continued to exist, though it is scarcely mentioned till it was captured and plundered by the Romans in the war with Antiochus. New Phocæa was founded by some Genoese about 1420 because of rich alum mines near by, and this spot is now occupied by a little village, Phokia or Fokia, while the site of the old city is still called Palæo-Phokia.

PHOCAÏS, fōk'ā-is. An epic poem ascribed to Homer, said to have been composed in Phocæa.

PHOCAS (Lat., from Gk. Φωκᾱς, *Phōkas*) (?-610). Byzantine Emperor from 602 to 610. He was an obscure centurion in the army, which was fighting the Avars on the Danube, when in 602 the soldiers rose in rebellion against the Emperor Maurice (q.v.), and Phocas was made their leader. He invested Constantinople and after the forced abdication of Maurice was chosen and crowned Emperor. His first act was to cause the execution of Maurice and his five sons, and throughout his reign he was notorious for his cruelty. In Europe an ignominious peace was maintained, while in Asia unsuccessful war was waged against the Persian King Khosru II (q.v.). He gave his only child in marriage to the patrician Crispus, and the images of the couple were indiscreetly placed by some of their friends in the circus, which was a privilege of royalty only. After this Crispus no longer felt secure, and he conspired with the rebellious exarch of Africa, Heraclius, to dethrone Phocas. This was accomplished in 610, and the tyrant was tortured and beheaded. Consult: J B Bury, *History of the Later Roman Empire*, vol. i (London, 1889); Rudolf Spintler, *De Phoca Imperatore Romanorum* (Jena, 1905); Edward Gibbon, *Decline and Fall of the Roman Empire*, vol. v (edited by J. B. Bury, London, 1912); Cambridge *Medieval History*, vol. ii (New York, 1913).

PHOCAS, (COLUMN OF. A famous column in the Roman Forum, erected in 608 by the exarch Smaragdus in honor of the Eastern Emperor Phocas and once surmounted by a gilded statue of Phocas. The column is 54 feet in height and is of a better style than that which prevailed at the time of its dedication. It is therefore supposed that it may have been taken from some earlier edifice or that an already existing monument was rededicated by Smaragdus. It was covered by the accumulated rubbish of centuries till 1813, when it was unearthed by the Duchess of Devonshire.

PHOCAS, NICEPHORUS II. See NICEPHORUS II PHOCAS.

PHOCIDÆ. See CARNIVORA; PINNIPEDIA.

PHOCION, fōsh'ōn (Lat., from Gk. Φωκίων, *Phōkion*) (c.402-317 B.C.). An Athenian general. He was of humble origin, but received a

good education and studied under Plato and Xenocrates. His first public service was performed under Chabrias in the naval battles at Naxos in 376 B.C. About 349 he was sent into Eubœa to quell a disturbance that had been fostered in Eretria by the partisans of Philip of Macedon and won a victory at Tamynæ. Several years later he led a body of Athenian hoplites to Megara, crushed Philip's faction there, and reestablished the long walls to Nisæa; and he also again conducted a force to Eubœa, where he liberated Orcus and Eretria from Macedonian influence. In 340 he was sent to the Propontis to act against Philip, who, besides suffering a number of minor reverses, found himself forced to abandon the siege of Byzantium and Perinthus. In politics, however, Phocion was a supporter of Philip and an adversary of Demosthenes, though not from mercenary or traitorous motives. When, after the destruction of Thebes in 335, Alexander sent to Athens demanding the surrender of Demosthenes and the other leaders of the anti-Macedonian party, Phocion advised compliance with the King's wishes. The proposal was rejected by the people, and an embassy was sent to Alexander to deprecate his resentment, but not until a second embassy had been sent, at the head of which was Phocion, was the King induced to remit his terms. After the death of Antipater Phocion became implicated in the intrigues of Cassander, the rival of Polysperchon, and was forced to flee to Phocis, but was surrendered to the Athenians and by them condemned to drink the hemlock. His body was carried out of Attica into the Megarid and there burnt. Shortly after his death there was a revulsion of feeling in his favor among the Athenians. They then celebrated his funeral obsequies at the public expense and erected a statue in his honor. Consult Plutarch's *Life of Phocion*, revised edition of translation by A. H. Clough, in Everyman's Library (New York, 1910).

PHOCIS (Lat., from Gk. Φωκίς, *Phōkis*). In ancient geography, a division of northern Greece, bordered on the west by Ozolian Locris and Doris, on the north by Epichemidian and Opuntian Locris, on the east by Bœotia, and on the south by the Gulf of Corinth (Map: Greece, Ancient, C 2). The greater part of the country is mountainous, with Parnassus (q.v.) filling the central and western portion; the northeast, through which the Bœotian Cephissus flows, is fertile. The chief town was Elatea, which commanded the entrance into Bœotia from the north. Other towns of some importance were Daulis, Abæ, the seat of an ancient oracle, and Hyampolis, but the most conspicuous place, from which the land chiefly derived its fame, was Delphi (q.v.), whose inhabitants, however, always declared that the control of the oracle did not belong to the Phocians. The Phocian State was a league of 22 cities, most of which were small. The Phocians appear to have been akin to the Dorians, though there were elements derived from earlier settlers in those regions, and there is some evidence in the southern portion for colonization from Crete and the Peloponnesus. The Phocians do not play a prominent part in the earlier history of Greece, though we hear of a desperate defense against the advance of the Thessalians, and in general they appear as enemies of the Thessalians and the Bœotians and as friends of the Athenians, who supported their claim to control Delphi. In 357 B.C. the Am-

phictyonic Council, apparently, through Theban influence, imposed a heavy fine on the Phocians for cultivating some land belonging to the Delphic oracle. The Phocians resisted the sentence and were favored, but not actively assisted, by Athens and Sparta, who were at that time on bad terms with the council and were hostile to Thebes. The Phocians seized Delphi and "borrowed" the temple treasures with which to maintain their army. For 10 years the war was waged with no decisive results, though in general to the advantage of the Phocians. Even the growing power of Philip of Macedon did not check them, for, while he was victorious in Thessaly, he could not pass Thermopylae, which was held by a Phocian army and an Athenian fleet. The Peace of Philocrates (346 B.C.) between Athens and Philip left the Phocians helpless, and the sentence of the Amphictyons, which expelled them from the council, condemned them to pay an enormous fine and dispersed them into small villages, thus virtually removing them from history. See GREECE, *Ancient History* (the paragraph relating to Philip II, father of Alexander the Great); PHILIP II.

PHOCYLIDES, fō-sil'ī-dēs. (Lat., from Gk. Φωκυλίδης, *Phokylidēs*) (?-c.560 B.C.). A Greek poet of Miletus, contemporary with Theognis. He wrote chiefly didactic poems in two or three verses, in hexameters or in elegiac metre, the 18 extant fragments of which have been included in almost all the collections of the lyric and gnomic poets. Ποιῖμα Νοσήτικόν, the admonitory poem, in about 230 hexameters, which has been preserved under his name, is now supposed to have been the work of an Alexandrine Jew of the first century B.C. Consult: Jacques Bernays, *Ueber das phokylideische Gedicht* (Berlin, 1856); Fenling and Goodwin, an edition with commentary and translation (Andover, Mass., 1879); F. Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit*, ii, 642 (Leipzig, 1892); Theodor Bergk, *Poetae Lyrici Graeci* (5th ed., ib., 1900; reprinted, 1914); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1911-13).

PHOEBE, fē'bē. 1. A name applied to the goddess Artemis or Diana (q.v.). 2. In Shakespeare's *As You Like It*, a shepherdess in love with the disguised Rosalind.

PHOEBE BIRD. A small olive-green, brown-headed tyrant flycatcher (*Sayornis phoebe*) or pewee (q.v.) of the United States, very familiar in gardens and named in imitation of its call. It makes a cup-shaped nest of mud and moss, which it attaches to rocky ledges and cliffs or to the piers of bridges, eaves of houses, and similar supports. Its eggs are white.

PHOEBUS, fē'būs (Lat., from Gk. φῶιβος, *phoibos*, bright, pure). A title of Apollo (q.v.), which even in Homer has become closely joined to his name. It refers to the god as the purifier from all stains of sin. Originally Phoebus seems to have been an independent deity, but the transparent meaning of the name prevented the development of a personality and made easy the absorption in the great defender from all evil, Apollo.

PHOEBUS, WILLIAM (1754-1831). A pioneer Methodist preacher. He was born in Somerset Co., Md., and entered the ministry in 1783. He was a member of the Christmas conference at Baltimore in 1784; in 1798 he settled in New York and practiced medicine but reentered the ministry in 1806. He desired the Metho-

dist church to be called the Evangelical church of America and wrote a work entitled *An Essay on the Doctrine and Order of the Evangelical Church of America as Constituted at Baltimore, 1784* (1817). He edited the *Experienced Christian's Magazine* (1796).

His grandson, GEORGE A. PHOEBUS (1830-1903), entered the Philadelphia conference, 1853, and afterward became a member of the Wilmington conference. He published *Beams of Light on Early Methodism in America, Chiefly Drawn from the Papers of Rev. Ezekiel Cooper* (1887), a work of very great importance as a source book of Methodist history.

PHENICIA, fē-nish'ī-ā (Lat., from Gk. Φοινίκη, *Phoinikē*, Phœnicia). The name used by the Greeks and the Romans, in its widest application, to designate the strip of territory about 200 miles long, from 5 to 15 miles broad, along the Mediterranean coast of Syria. On the east this tract is bounded by the Lebanon Mountains, being watered by the streams that flow from them. The northern and southern limits are not easily defined, and they varied from time to time. Ptolemy fixes the northern boundary at the Eleutheros (Nahr el Kobir) and the southern at Mount Carmel, but there were undoubtedly Phœnician settlements both farther north and farther south. The origin of the name is unknown. Its derivation from *Phoinix* (date palm) is uncertain, as there is no evidence to show that that tree grew in Phœnicia. A more probable derivation is from the Greek *phoinos* (blood red), referring to the purple (crimson) which the Phœnicians introduced into Greece. In the Old Testament this territory is designated as part of Canaan (q.v.) and the inhabitants as Sidonians. This latter designation occurs also in Homer and points to a period when the land was under the leadership of the city of Sidon. Being shut off from the east and the south by mountain ranges and on the west limited by the sea, it was impossible for Phœnicia to play any important political rôle. Nor were the different settlements ever welded together into one powerful kingdom. They formed a nation, with one or the other holding the hegemony. The northernmost port was Arvad or Aradus (the modern Ruad), mentioned in Ezek. xxvii. 8, 11, and in Assyrian inscriptions, it was situated on an island near Tripolis. A second port was Simyra (Assyr. Sumari or Simirra), mentioned in the Amarna letters (c.1400 B.C.) and in Gen. x. 18. The most important of the northern towns was Gebal, called by the Greeks Byblos (q.v.). It had relations with Egypt and Assyria in very early times and exercised a sort of supremacy over the country around it, rivaling Sidon and Tyre in the south and preserving its independence through the greater period of Phœnician history. The city of Berytus (Beirut) belonged originally to the Principality of Byblos, but afterward became independent. Farther south were the cities of Sidon, Sarepta, Tyre, and Acco (Acre), all of which were old settlements, dating from at least about 1800 B.C., when Egypt inaugurated her Western Asiatic campaigns. Several of these cities stood on islands and were thus fortified by nature. Of these cities Tyre and Sidon (qq.v.) rose to a controlling position and from time to time interchanged as the ruling power. There were also a number of inland towns, such as Kana, but they never attained any importance.

It is impossible to say at how early a date the Semitic population formed settlements in Phœnicia. They must have come upon one of the migratory waves that issued from the Tigris-Euphrates valley, and their close relationship to the Hebrews shows that they branched off with them from the Aramæan wave which formed permanent settlements in northern Syria. At the time the Amarna tablets were written (c.1400 B.C.) the coast towns were all occupied by Semites; and from what is now known of the history of the relations between Babylonia and Syria in early days, the settlement of the Semites in Phœnicia may be placed c.2500 B.C. or earlier. This would agree with the assertion of Herodotus that Tyre was founded about 2730 B.C.

What little is known of the history of Phœnicia may be divided into six periods: (1) from the earliest time to the Egyptian supremacy, c.1800 B.C.; (2) the period of Egyptian control, to c.1400 B.C.; (3) the advance of the Hittites and the Assyrians, to c.1100 B.C.; (4) the period of independent development, 1100 to 900 B.C.; (5) the period of Assyrian and Babylonian control, to the downfall of the Neo-Babylonian dynasty, 539 B.C.; (6) the period of the Persian, Greek, and Roman supremacy. The earliest period must have been dominated by Babylonian influences, since we find Babylonian script and language used as the medium of diplomatic correspondence. This was maintained even after the rulers in the Phœnician and Palestinian cities had become vassals of Egypt. The Babylonian King, Sargon (3800 B.C.; see *SARGON*, 1), extended his conquests as far as Cyprus, and he must have laid a part of Phœnicia under tribute. This view has been challenged, however, by L. W. King, in his *Chronicles Concerning Early Babylonian Kings*, vol. i, chap. ii (New York, 1907); he holds that Sargon carried his conquests rather to the east, to the Persian Gulf. Each settlement at the time formed a sort of independent principality. In the papyrus Anastasi I (sixteenth century B.C.) the Phœnician cities Byblos, Berytus, Sidon, Sarepta, Tyre, and Aradus are mentioned. The influence of Egypt was strong. She exacted a tribute, kept the principalities under native rulers, and discouraged any coalition. The country unfortunately lay between Egypt and her great rival, the State of the Hittites (q.v.). The latter people, having secured possession of the districts around Damascus and Tunip, maintained a successful opposition to the Egyptian armies; and Ramses II was obliged to make a treaty with them, yielding the territory north of Mount Carmel. The city of Tyre was at this time gradually reaching the position of eminence which it kept for several centuries; Sidon (q.v.) played a secondary part, the oldest colonies having been sent out by the former city. In the thirteenth century Assyria began to check the growing power of the Hittites. For a time the coast cities were forced into a position of vassalage; but after the death of Tiglath-pileser I (c.1100 B.C.), Syria, Palestine, and Phœnicia enjoyed a brief respite. In Phœnicia a coalition was formed with Sidon at its head. Tyre, however, set aside her rival and under Abibal (tenth century B.C.) and his son, Hiram, extended her control to Cyprus. It was this Hiram who furnished workmen and material for Solomon's building operations in Jerusalem. (See *HIRAM*.) Assurnasirpal (870 B.C.) re-

ceived tribute from Tyre, Sidon, Byblos, and other cities. Assyria had great difficulty in holding these distant places. Rammanirari III had again to subdue Tyre and Sidon (808 B.C.), and Tiglath-pileser III (734 to 728 B.C.) not only sent one of his generals there, but colonized people of other nations in the district. King Luli (Elulæus) fell off completely from Assyria and, under the leadership of Hezekiah of Judah, made common cause with Tirhaka. Sennacherib (700 B.C.) forced him to flee to Cyprus, putting a new king, Ittobaal, in Sidon. In 678 B.C. Sidon was destroyed, and the various rulers in Phœnicia and Cyprus did homage to the Assyrian King. The power of Assyria was, however, on the wane, and under Psammetik I (625 B.C.) Egypt resumed her sway over the coast. In 585 B.C. Tyre was again invested by Nebuchadnezzar II, but though the other Phœnician cities fell early into his power, it held out for 13 years. King Ittobaal and his family were carried off to Babylon. In 539 B.C. Phœnicia, after the rule of a few legitimate kings, sent there from Babylon, became part of the Persian Kingdom.

During the Persian period Sidon forged ahead of her old rival, Tyre. The seacoast towns, with their large fleets, were necessary for the maritime operations of the Persian kings. Three hundred Phœnician triremes warred with Xerxes against Greece. Eighty Phœnician ships engaged in the battle of Cnidus (396 B.C.). Like its old rival, Sidon became involved in the quarrel of the two great nations who fought for the supremacy of western Asia. Under Tennes II it joined with Nectanebo II of Egypt and might have been successful had not its King betrayed it to Artaxerxes III. This caused a great catastrophe (345 B.C.) in which 40,000 lost their lives. The power of Sidon was broken. On the appearance of Alexander the Great in Phœnicia, Sidon, Aradus, and Byblos immediately submitted, but Tyre held aloof and capitulated only after a siege of seven months (July, 332 B.C.). Eight thousand lost their lives, 30,000 were sold as slaves. Sidon and Tyre and, together with them, Phœnicia vanished from the world's history. Yet we hear of the cities again during the reign of the Ptolemies, and a certain amount of autonomy must have been given at least to Sidon and Tyre. Phœnician inscriptions tell of independent rulers in the fourth and third centuries B.C., notably in Sidon, where the family of Echmunazar ruled. In 197 B.C. Phœnicia came into the power of the Seleucid kings of Syria and became involved in the collapse of that Kingdom. In 64 B.C. it became with Syria a Roman province, and, although the trade of the seacoast towns was greatly benefited thereby, their Phœnician character was soon lost and forgotten.

The influence of Phœnicia, however, was not confined to the narrow coast strip of Syria. At an early date her merchants brought about a contact between the East and the West, which constituted an important factor in ancient history. These merchants, traveling through the Mediterranean, formed colonies wherever they went, and many of the place names along the African coast seem to show that Phœnicians became there the dominant factors.

Only some of the general features of Phœnician religion are known. Each town had its protecting deity, with whom a female consort was often associated. In many cases this god

was known simply as the Baal (i.e., lord) of the place. In others he bore a special name, such as Melkart in Tyre, Sakkun in Carthage. The Phœnician pantheon was quite large, though some of the names may be different designations applying to one deity. The most important of their deities were Adonai (Gk., Adonis, q.v.), worshiped in Byblos (his cult was also transferred to Cyprus); Eshmun, a sun god, worshiped at Sidon, Berytus, and Carthage, and in Cyprus; Melkart, worshiped at Tyre; Tanith, the great goddess of Carthage, who was often associated with a Baal, as was Astarte on the Phœnician mainland. Foreign gods were also easily admitted into this pantheon, e.g., the Syrian gods Reshef and Anat, the Egyptian Isis, Osiris, Bast, and Horus, and the Babylonian Hadad. A parallel to this is found in the general tendency of the Phœnicians to adopt the art, culture, and myths of the surrounding peoples. Their religion therefore presents a strangely conglomerate character. Traces of primitive conceptions which they shared with other Semitic peoples persisted to the latest period. Trees, stones, and rivers were regarded as sacred principles underlying the animistic stage of religious development. In early days the cult was carried on in groves or on the tops of mountains. In later times small sanctuaries were erected and inclosed in a sacred area. Subsequently, perhaps under foreign influence, more elaborate structures were erected, temples with a large altar in a court open to the sky, to which was attached a covered shrine, regarded as the holy of holies. The chief festival of the Phœnicians seems to have been the one which was celebrated at the time of the summer solstice, commemorating the death and return of Adonis. The priesthood must have assumed large proportions, but it does not seem to have wielded the power that the priesthood held in Egypt and Babylonia, though the ruler at times was chief priest also.

See GLASS.

PHENICIAN (fē-nish'an) ART. The art of the Phœnicians was both cosmopolitan and commercial. Their lack of originality and of artistic sense made it easy for them to turn their energies to copying the arts of their powerful neighbors, especially of Egypt and Assyria, and to cultivating those branches of art that were merchantable and transportable. They show the influence of the Hittite and other Syrian tribes in their magnificent fortifications and of the Iranians, perhaps, in their lack of monumental temples. A branch of their school in Cyprus developed monumental sculpture in stone under archaic Greek influence, and this

was echoed in the Phœnician settlements in Spain (e.g., Elche); but otherwise large sculptures in stone seem rare. It was otherwise with works in metal, from bronze to gold, and in terra-cotta, glass, iron, and textile objects. In all these branches the Phœnician artisan distinguished himself and supplied most civilized nations. It was after 1000 and before 500 B.C., when international commerce was almost exclusively in the hands of the Phœnicians, that this art was most brilliant and that we find its products in the tombs, palaces, and sanctuaries of nearly every country of the Mediterranean and of western Asia. Later the African branch, with its centre at Carthage, continued its history, even under Roman dominion, as is being brilliantly shown by Delattre's excavations.

Architecture. The eclecticism of the Phœnicians appears in their monuments. From the few surviving remains it would seem that Babylonian, Egyptian, Assyrian, and Persian influences alternated. The little temple of Amrith is thoroughly Egyptian, and so are the less important tabernacles at Ain el Hayat. The general scheme of the larger temples was a court in which the cella or tabernacle rose on a basement. The temples of Cyprus should be reckoned with those of Phœnicia, though they approach closer to the Greek type with columnar portico. Of the famous temples of Tyre, Sidon, Gebal, and Paphos nothing remains. Almost as thorough a destruction has overtaken the military and civil constructions by which the Phœnician cities were made almost impregnable. Something remains at Arvad, Berytus, Sidon, and at Eryx, in Sicily, in magnificent masonry that passes from the earlier polygonal and cyclopean to the later Hellenic course construction in stone. Thapsus alone has preserved part of its harbor constructions, so important in all Phœnician cities. As in the case of the Etruscans, we can learn something from the sepulchral architecture, both the free-standing specimens, like the circular monolith of Amrith with its guardian lions, and another at the same place in the form of a house with pyramidal roof, and the other type of rock-cut chambers, such as those of Carthage and nearly all the cities. The temple of Solomon at Jerusalem seems to have been in part of Phœnician design, especially the two bronze columns Jachin and Boaz and the bronze laver on its 12 oxen, but the Phœnician element appears in detail and execution, not in plan.

Sculpture and Minor Arts. The anthropoid sarcophagi, of which the Louvre possesses a number, while others, found at Sidon, are now in the Museum of Constantinople, show the influence of Egypt on monumental Phœnician sculpture. But the sarcophagi and statues found by Cesnola and others in Cyprus are by far the largest part of the Phœnician plastic patrimony. Here, even more than in Persian sculpture, we find that the Hellenic idea of letting the form of the body pierce through the drapery was adopted, and that the attempt at expressiveness took the form of the grimace or smile. There is a curious amalgamation in this school of such Hellenic elements with others from Egypt and Assyria, with the composition varying according to political predominance. Statues of gods and goddesses as well as of priests, sometimes colossal, show facility of execution. The sarcophagi, especially that from Amathus, are of equal importance and are in high relief, in contrast to the Assyrian low-relief technic.

In the field of metal work the most extraordinary objects that have been preserved are the great bronze votive shields from the cave of Zeus on Mount Ida in Crete, with their Egyptian sphinxes, Assyrian lions, and figures of Merodach and zones of animals like those on the early Greek vases (especially Corinthian). Equally important on a smaller scale are the silver dishes or pateræ found in Assyrian palaces (Nimrud), in Cyprus, and in some Italian tombs, with their exquisite scenes engraved or in relief, from mythology, legend, or daily life. The Dali cup in the Louvre, the Palestrina patera and those from Curium in the Metropolitan Museum, are the finest pieces of work preserved from Oriental antiquity. The mixture of subjects shows that the Phœnician artist cared less for the significance than for the artistic quality of the design and often made mistakes in copying scenes originally conceived by Assyrian or Egyptian artists.

The gold and silver ware on the tables of Oriental monarchs, their bronze serving vessels, were usually the work of these Phœnician artists, who were everywhere, even in Nineveh. It was not quite the same with ivories, only some of which are Phœnician. But, on the other hand, the Phœnicians absorbed nearly all the trade in glass vessels, after learning the art from Egypt, and the glass factories of Tyre and Sidon and Berytus remained famous even through the Middle Ages. The collection in the Metropolitan Museum (mostly from the Charvet collection, one of the finest in existence) contains many Phœnician pieces, and the tombs that are continually being opened in Phœnicia furnish more glass than any other class of objects.

It would seem as if in jewelry the Phœnicians played the important rôle of giving models to Greek and Etruscan artists after learning from Egyptian and Asiatic artists. Lotus flowers and anthemions, heads of Isis, of Hathor, and other gods and genii, animals and birds in relief or as pendants, rosettes and groups of bulls hanging from chains, formed most elaborate designs in earrings, necklaces, tiaras, etc. In the field of engraved stones, precious or rare, the Phœnicians imitated as usual; the Egyptian scarab and the Assyro-Babylonian cylinder and seal were equally popular, with borrowed mythological scenes, until, in the fourth century B.C., the fashion turned exclusively to Greek models.

Bibliography. The standard work of reference is Perrot and Chipiez, *History of Art in Phœnicia and its Dependencies*, translated by Walter Armstrong (2 vols., New York, 1885); but this may be supplemented for architecture by Ernest Renan, *Mission de Phénicie* (Paris, 1865-74); by C. E. L. W. Fröhner, *La verrerie antique* (Le Pecq, 1879), for the Charvet collection of glass; by Joachim Ménon, *La glyptique orientale* (Paris, 1883), for engraved gems and stones; by Charles Clermont-Ganneau, *L'imagerie phénicienne* (Paris, 1880), for the silver pateræ; by Orsie Halbherr, *L'antro di Zeus in Creta* (Rome, 1883), for the Phœnician shields, etc. See GLASS.

PHœNICIAN LANGUAGE. The language spoken by the inhabitants of Phœnicia. It belonged to the Hebrew-Phœnician division of the Semitic family of languages and represents in general an archaic stage of Hebrew and Moabitic, although it differs from the North Semitic group in certain particulars, such as having

tan (like the Arabic *kāna*) for the copula instead of *haya*, as in Hebrew. Phœnician spread widely from its home as Punic colonies were founded in the islands of the Mediterranean and Aegean, in southern and western Asia Minor, southern France, and especially in northern Africa. The diffusion gave rise to variations both of dialect and script, which were, however, comparatively slight. The sources of our knowledge are the inscriptions on tombs, votive tablets, coins, seals, etc., the transliteration of Phœnician phrases in Plautus's comedy of the *Pœnulus*, and the proper names and words found in the Old Testament, in the inscriptions of Assyria and Egypt, and in classical writers. The inscriptions are by far the most important source. Although they are very numerous, the vocabulary is relatively scanty on account of their monotonous content. They cover the period from about 600 B.C. to 200 A.D. The longest are the inscriptions found upon the sarcophagus of King Eshmunazar at Sidon in 1855 of 22 lines, at Marseilles in 1845 of 21 lines, and at Larnaka in 1879 of 29 lines. The passage in the *Pœnulus* and the words and names in other foreign sources are of value in fixing the vocalization and pronunciation of Phœnician, since the alphabet, like all the Semitic scripts, excepting the Assyro-Babylonian and Ethiopic, writes only the consonants. The alphabet, which itself seems derived from the South Arabian script, is of importance as the ancestor of the Græco-Roman family of alphabets. (See PLATE of ALPHABETS.) The Neo-Punic language, which lasted in some measure till the fifth century A.D., shows important deviations from the older Punic that existed at Tunis and east Algeria. St. Augustine, who was practically a Carthaginian, states that Punic is closely related to Hebrew. Phœnician literature seems to have been very scanty, consisting chiefly of annals, and at least one work, by Mago, on agriculture, and has been entirely lost with the exception of Greek translations of the voyage of Hanno (q.v.) and fragments asserted to be translations of the histories of Sanchuniathon (q.v.). See SEMITIC LANGUAGES.

PHœNISÆ (Lat., from Gk. *Φοινισαί*, *Phoinissai*, Phœnician Women). A play by Euripides, so called from its chorus of Phœnician captives at Thebes. The myth which forms the subject of the play is the same on which the *Seven against Thebes* is based.

PHœNIX (Lat., from Gk. *φœνιξ*, *phœnix*). The name of a mythical Egyptian bird frequently mentioned by classical writers. Herodotus (ii, 73), who says he heard the story at Heliopolis and saw a picture of the bird there, relates that the phoenix, on the death

of his father, embalms the body in an egg made of myrrh and every 500 years conveys it from Arabia to the temple of the Sun at Heliopolis. According to Pliny (*Nat. Hist.*, x, 2), there is only one phoenix at a time, and when he perceives that his end is near, he builds in Arabia a nest of twigs of cassia and frankincense and dies upon it. From the body is generated a worm which develops into the new phoenix. The young bird then conveys his father's body to Heliopolis and burns it upon the altar there (Tacitus, *Ann.*, vi, 28). According to Horapollon (ii, 57), the phoenix casts himself upon the ground and receives a wound, from the ichor of which springs his successor. But the most familiar version of the birth and death of the phoenix is that given by the *Physiologus*, in which the bird burns itself upon a nest or pyre of odoriferous woods and the young phoenix springs from the ashes. The interval between the bird's appearances at Heliopolis is variously stated; the period usually named is 500 years, but 1461 and 7006 years are also given. According to Tacitus (*Ann.*, vi, 28), the phoenix appeared four times in Egypt: (1) under Sesostris (q.v.), (2) under Amasis II, (3) under Ptolemy III, and (4) in the year 34 B.C.

In Greek and Roman art it was common to represent the phoenix as an eagle; but by the Egyptians, who called it *dennu*, the bird was depicted as a heron with two long feathers growing from the back of its head and sometimes with a tuft hanging from its breast. It symbolized the morning sun rising out of the glow of dawn, and hence it was looked upon as the sacred bird of the sun god Ré. It also represented the new sun of to-day springing from the body of the old sun of yesterday, which had entered the lower world and become one with Osiris. Hence the phoenix or *dennu* was regarded as a manifestation of Osiris and became a symbol of the resurrection, continuing to serve as such even in early Christian times. It has been supposed by some scholars that the phoenix is mentioned in Job xxix. 18 and Ps ciii. 5, but the identification is very doubtful. Consult: Kirchmayer, "On the Phoenix," in *Collectanea Adamantæ*, vol. ii (Edinburgh, 1886); K. A. Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); id., "Die Phoenix-Sage im Altenägypten," in *Zeitschrift für ägyptische Sprache*, vol. xvi (Leipzig, 1878); E. A. T. Wallis Budge, *The Gods of the Egyptians* (2 vols., Chicago, 1904).

PHOENIX, or **PHENIX**. A city in Lee Co., Ala., on the Chattahoochee River, opposite Columbus, Ga., and on the Central of Georgia Railroad (Map: Alabama, D 3). It is a residential place and is also of considerable importance as a commercial centre. The industrial establishments include a lumber mill and coffin, cigar, and mattress factories. Among the chief buildings are the city hall and two fraternal society halls. Settled about 1860, Phoenix was first incorporated in 1883. The water works are owned by the city. Pop., 1900, 4163; 1910, 4555.

PHOENIX. A city, the county seat of Maricopa County and the capital of the State of Arizona, 150 miles by rail northwest of Tucson, on the Maricopa and Phoenix and the Santa Fe, Prescott, and Phoenix railroads (Map: Arizona, C 4). Among the more prominent features are the capitol, Agricultural Experiment Station,

Federal Building, Arizona School of Music, city hall, Carnegie library, courthouse, and splendid high-school and central-school buildings. The city is a popular winter resort. Points of interest near by are the ruins of the Aztec Community Houses, Hieroglyphic Rocks, Indian Mounds, and Cactus National Park. Phoenix has extensive commercial interests, controlling an important trade in live stock, grain, fruits, ostriches, hay, honey, and olives. There are also considerable mining interests. Settled in 1870-75, Phoenix was incorporated in 1881, the charter of that year being revised again in 1893. In 1913 the commission form of government was adopted. The city owns the water works. Pop., 1890, 3152; 1900, 5544; 1910, 11,134; 1915 (U. S. est.), 17,798.

PHENIX, JOHN. See DEERY, GEORGE HORATIO.

PHENIX PARK. A public park in Dublin, containing a granite monument in honor of Wellington. The park became famous through the assassination within its borders, on May 6, 1882, of Lord Frederick Cavendish, Chief Secretary for Ireland, and Thomas Burke, the Undersecretary.

PHOENIXVILLE. A borough in Chester Co., Pa., 28 miles northwest of Philadelphia, at the junction of French Creek with the Schuylkill River and on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, K 7). It has a Carnegie library and a hospital and is an important manufacturing centre, well known for its great iron and steel mills, boiler works, silk mill, underwear and hosiery factories, and a match factory. The government is vested in a burgess, chosen triennially, and a council, which elects all municipal officials excepting the school directors, who are independently chosen by popular vote. The borough owns and operates the water works. Phoenixville was settled in 1732 and was incorporated as a borough in 1849. Pop., 1900, 9196; 1910, 10,743; 1915 (U. S. est.), 11,557.

PHOLAS (Neo-Lat., from Gk. *φωλὰς*, a lurking mollusk which makes holes in stones). A genus of bivalve mollusks having much roughened, filelike shells with which they excavate cavities in soft rocks, in other shells, etc., for their own occupancy. See DATE SHELL, and Colored Plate of CLAMS.

PHOLUS. A centaur, son of Silenus, by whom Hercules was entertained on his journey in quest of the Erymanthian boar. When the other centaurs were attracted to the cave of Pholus by the odor of the wine with which he regaled the hero, Hercules scattered and pursued them, but on his return found Pholus accidentally killed by one of the arrows which he had withdrawn from the body of a slain centaur and which had dropped from his hand and stuck in Pholus's foot.

PHONAUTOGRAPH, fôn-â'tô-graf. See MELOGRAPH.

PHONENOSCOPE (from Gk. *φωνή*, *phonē*, voice + *ἐνδον*, *endon*, within + *σκοπεῖν*, *skopein*, to examine). An instrument used in auscultation of the heart and lungs in the same manner as a stethoscope. It consists of a shallow metal cup to which are attached rubber tubes fitting into the ears and covered by a disk or diaphragm of ebonite. From the centre of the disk springs a small rod terminating in a button. This button is placed upon the area to be examined, and the tubes are fitted into the ears of the

examiner. The instrument is much more delicate than a stethoscope and is of particular value in distinguishing between endocardial and pericardial murmurs.

PHONETIC LAW (Gk. φωνητικός, *phōnētikos*, relating to sound, from φωνή, *phōnē*, sound, voice; connected with φῆναι, *phēnai*, Lat. *feri*, to speak, OHG. *ham*, Ger. *Bann*, AS. *bann*, Eng. *ban*). In comparative linguistics, a formula which sums up a certain phonetic correspondence or a certain number of such correspondences. The term "law" in this sense is therefore essentially different from its application in mathematics or chemistry and approaches rather the usage of the word as it is employed in psychology. A given phonetic law, moreover, is required to be operative only under given conditions in a given dialect or dialect group during a given period. As an example of such a law we may take the representation of the Indo-Germanic *ā* which becomes in Germanic *ō*, which remains unchanged in Gothic, Icelandic, Old Saxon, and Anglo-Saxon: as Skt., *bhrātar*, Gk. φράτηρ, Lat., *frāter*, brother, but Goth. *brōthar*, Icel. *bróðhēr*, OS. *brōdhar*, AS. *brōdhar*. Further, it is a phonetic law in Old High German that such an *ō* becomes *uo*, which is changed in New High German to *u*, so that we find corresponding to Goth. *brōthar*, OHG. *bruoder*, NHG. *Bruder*. On the other hand, Indo-Germanic *ā* becomes *a* in Old Church Slav and *o* (written *o*) in Lithuanian; as Skt. *bhrātar*, brother, OChurch Slav. *bratrŭ*, Lith. *brolis*. As the science of comparative linguistics developed, it was found that sound changes followed certain rules. The very earliest investigators, however, seem to have paid little attention to the problem whose enunciation and discussion was destined to mark an epoch in the history of the science, the question as to the invariability of phonetic law. Yet even then it was realized that etymology (q.v.) without strict adherence to phonetic law was capricious and unscientific. The existence of such law was emphasized by the famous discovery known as Grimm's law (q.v.), which was in its turn supplemented and accentuated anew by the enunciation of Grassmann's law (q.v.), Verner's law (q.v.), and the palatal law, which postulated the existence of *e* in Pre-Indo-Germanic. In 1876 the logical result of phonetic investigations up to that time was given by Leskien, when he stated the theorem that phonetic laws know no exceptions. This was the keynote of the neogrammarian movement. (See PHILOLOGY.) Osthoff and Brugmann two years later stated the principle in its definite form as follows: "All sound change, in so far as it operates mechanically, is carried out according to invariable laws." By this modification of Leskien's statement the necessary scope was given for analogy (q.v.) in converting the action of the laws. Exceptions were therefore only apparent, not real, and they were to be explained either by the operation of analogy or as the results of laws yet undiscovered. This latter point had already been emphasized by Leskien, as Whitney had laid stress on the importance of analogy in explanation of many difficult linguistic phenomena. The point at issue was unfortunately shifted, and the gulf between the old and the new schools of grammarians widened almost hopelessly. The contention became, not the nature of phonetic law, wherein, it would seem, all might be in harmony, but whether the laws were invariable

or not—a problem which is yet unsolved. Without going into the details of the long discussions which followed after 1878, where Georg Curtius and Brugmann were the protagonists for the old and the new schools respectively, it may be said that the net result has been a distinct gain for the neogrammarian movement. Phonological and etymological investigation at present tacitly accepts the invariability of phonetic law. At the same time it is not as rigidly bound by dogmatic adherence to this principle as was the case when the enthusiasm of its novelty was potent. The influence of the doctrine has, then, been most beneficial in enforcing accuracy in the application of the laws and compelling exact and full explanation of any deviation, however slight, from their normal action. On the other hand, sufficient attention has not yet been devoted to the explanation of the laws themselves. Why, e.g., to revert to the example already given, does Indo-Germanic *ā* become *ō* in certain languages, *a* in others, and in others still remain unchanged? Phonetic changes, instead of being absolutely invariable, are only relatively uniform and obey only general tendencies. These tendencies are governed to a large extent by physiological requirements and further by psychological processes, especially the associative faculties of analogy, imitation, and the like. Initially the changes are individualistic. If the phonetic change in question is physiologically possible and pleasing to a speech community, however small, it may be adopted imitatively and may then be extended analogically, and, being accepted by a widening range of speakers, it may develop into a general tendency, become relatively uniform, and thus be made a phonetic law. These conclusions are confirmed by the study of living, spoken dialects, where the artificial uniformity of script does not mislead the investigator, as is too often the case with languages that have been preserved only in literary forms. See GRASSMANN'S LAW; GRIMM'S LAW; PHILOLOGY; PHONETICS; VERNER'S LAW.

PHONETICS. In its broadest sense, a study of the whole range of sounds, articulate, musical, and otherwise. It is, however, usually confined to the articulate sounds of human speech. Even in this restricted sense it is still broad enough to include the subject of the acoustic or me-

chanical side and the anthropological or philosophical side. It may discuss simply the speech vibrations that cause any particular sensation on the human ears, or it may include an investigation of the manner and causes of the changes the articulate sounds of a language undergo as it develops. In the first case it should consider the mechanism and methods by which the sounds are produced and also the way in which they are made effective in the ear and impress the brain.

The variations of articulate sounds and the symbols which from time to time may be used to represent them constitute questions that are frequently treated under comparative philology (q.v.).

Confining the attention to what may be called the acoustics or physics of phonetics, the subject naturally falls under three heads: What is tone quality, or the mechanical difference between two sounds? How are sounds produced in the human voice? How are they perceived in the ear? The divisions may best be treated in the order given.

One sound differs from another in three factors, pitch, intensity, and quality. (See ACOUSTICS.) The pitch and intensity, or loudness, are of but little importance in this connection. The controlling factor is the quality. In articulation the sounds are divided into two broad classes: the vowel sounds, or those which are essentially modifications of vibrations set in motion by the larynx, as will appear later; and the consonants, or those sounds that are more essentially a peculiar stopping or starting of a vowel sound and are apt to form the transition from one vowel to another, by some one of an infinite variety of ways.

Taking up the discussion of the vowel sounds first as being the simpler case, it is evident that these sounds, which last with a uniform character for an appreciable fraction of a second or at least may be so prolonged, must depend for their distinguishing peculiarities upon the same factors as any other sound. As the pitch of a sound depends upon the length of the wave, and the intensity upon the height of the wave, so does the quality of the sound depend upon the shape of the wave. It has been demonstrated that any wave motion, no matter how complex, may be considered as made up of a series of simple waves of differing lengths and heights. Therefore any quality of sound, no matter how complex, must be composed of simple components, differing in pitch and intensity. By a simple sound is meant one in which the vibrating particles move in a simple harmonic motion, similar, e.g., to that executed by a pendulum. When a violinist plays a particular note, it differs from the same note on the organ or the piano or the wind instruments only in the relative number, intensity, and pitch of the partials or overtones which accompany the fundamental or pitched tone. In a manner entirely analogous, the vowel sounds of the human voice differ one from another, when the same fundamental tone is being produced, only in the relative number, pitch, and intensity of the accompanying partials. It is believed by some that the phase relation of the components affects the quality of the sound also, but this is still an open question and certainly does not affect the case of articulation.

The question, then, is to determine just what are the particular combinations of elements which

form the various vowel sounds. In the first place, it has been shown conclusively that the same relative components will not produce the same vowel sounds on different pitches. For example, a certain combination, bearing a definite relation to a fundamental of 256 vibrations a second, will produce a certain vowel quality, but if the rates of all these components are raised by the same interval of a fifth the vowel quality will be quite different. In other words, that combination which is recognized as giving a perfectly satisfactory *a*, as in *father*, on a pitch of middle *c*, is entirely different from that which is similarly recognized on a pitch an octave higher.

There are two theories at present as to what constitutes the essential characteristic of a particular vowel sound. Some hold that each vowel sound always contains in its complex a certain characteristic tone component of definite pitch and that the presence of this element makes that vowel. For example, *a*, as in *father*, has its essential vowel tone; the vowel of *meet* would have a different tone. This theory holds that the pitch of the characteristic elements is constant, irrespective of the pitch of the fundamental, or main tone. Others believe that there is no difference in the question of tone quality in vowels from the same question as applied to any tone. Under this conception there would be no one essential component, but all would be essential and the total would be characteristic. This would mean that the difference between *o* and *a* pronounced on treble *c* is of exactly the same character as that between the two sounds when that note is played on a flute and on a violin. In other words, vowel quality is not different from tone quality.

The actual solution of this question is enormously complicated by the fact that habit allows the greatest possible variation in what may still be called a particular vowel. For example, the *a* in different individuals may differ more radically than the *a* and *o* in the same individual.

Helmholtz, Rousselot, and numerous other scholars attempted to determine the pitch of the characteristic tones of the vowels. No two of these scholars agree; hence it is not surprising that the greatest difference of opinion exists as to the exact pitch of the characteristic tone and also as to the particular combination of partials which form the particular vowel sounds. In general it seems well established that in the sound of *a*, as in *father*, the complex consists of the fundamental and the first 8 or 10 overtones with intensities decreasing as they rise in pitch. The vowel in *meet* has not the higher overtones and is characterized by a relative strengthening of the third and fourth in the series. *O*, as in *moat*, has number four rather strong; and finally *u* in *boot* is little if anything besides the fundamental and a little of the first overtone. Further than this, we are not safe in going at the present stage of research. It is to be understood that these overtones are in the series present in a string or an open pipe; i.e., the rates of vibration of the fundamental and overtones are in the ratio of 1 to 2, 3, 4, 5, etc.

The question of the exact composition of any vowel on any pitch cannot be definitely and finally determined, for the simple reason that the character of the sound differs with every individual, and no one can be said to be right and all the others incorrect. Specific analyses

in particular cases can of course be given, but general conclusions should be stated only with caution.

As to the quality of the sounds of the consonants little can be said at present, as the case is much more complex than that of the vowels. On the one hand the quality is rapidly changing from instant to instant, thus offering new and special difficulties to the analyst; and on the other hand the simple more or less musical tones are often accompanied by a number of irregular noises like the hiss, the aspirate, etc. There are also the peculiar methods of stopping and starting the sounds, as in *p*, *b*, *d*, *g*, etc.

Thus far no rigid analysis of the consonants has been possible from the standpoint of acoustics or physics, although the individual variations may be less than in the vowels.

The second branch of the subject is the apparatus and method of production of human articulate sounds. This function is performed by the joint action of the lungs, larynx, mouth, and nose. The lungs are simply the bellows and serve to supply the air to actuate the vocal cords and thus produce the various sounds; they supply the raw material and are the source of energy.

In the larynx (q.v.) is to be found the original source of all the sustained sounds that bear any resemblance to musical tones. Whispersings, hisses, aspirates, etc., are formed independently of the larynx. In the larynx is to be found a pair of cords or membranes, which may be so drawn together over the top of the windpipe that they virtually close it. If air from the lungs is forced against the cords under the above conditions, they may be set into vibration and produce a sound. The pitch of this sound is regulated by the length, weight, and tension of the cords, there being present in the larynx sets of muscles for the involuntary control of these three factors which determine the pitch of a vibrating cord. Confining the attention again to the vowel sounds, it may be said that the principal function of the larynx is to produce a sound which can be molded into any one of the vowels, but that its action is not determinative as to which vowel shall be produced. Articulation is not performed by the larynx, but by the agencies between it and the outer air. The particular variation of tone that is produced by an individual depends upon the cavities of the mouth and nose, the position of the various movable parts, as the tongue and palate, and the size and shape of the opening at the teeth or lips. In the flute and the clarinet it is the number and location of the openings that determine the pitch to a large extent; but in the human voice it is the larynx which determines the pitch of the fundamental, while the size, shape, and openings of the cavities of the mouth and nose determine the quality of the sound, i.e., the vowel sound produced. Resonance as applied to this subject means that property of a mass of air by virtue of which it can pick up and intensify the vibrations which fall upon it when these vibrations are of a frequency bearing the proper relation to the size, shape, and opening of the air mass. The vocal cords produce a complex sound composed of a fundamental and a more or less complicated series of overtones; this sound passing out through the cavities of the mouth and nose has certain tones reinforced by virtue of the resonance of the cavities, while other compo-

nents are virtually smothered, from finding no means of reinforcement.

Cases are on record where the whole larynx has been removed and a silver one substituted, so arranged that a simple reed could be inserted, and the patient could articulate just as well as before, with the sole difference that he spoke always on the same fundamental pitch. Individual or race peculiarities of pronunciation may, of course, be largely owing to peculiarities in the dimensions and character of the vocal cords and larynx, as well as to the cavities of the mouth and nose, etc.

The third and last element to be considered under the physics of phonetics is the sound-receiving apparatus of the human being, the ear (q.v.).

In the history of phonetics for the past century two movements require comment—the so-called English school of phonetics, and experimental (or instrumental) phonetics. Alexander Melville Bell (q.v.) is considered to have given an impetus to the English school when, in 1867, he published *Visible Speech*. Bell contrived a cumbersome and really absurd alphabet in which the form of the letter indicated the position of the pertinent organs of speech. One result of Bell's work was a close study of the positions and actions of the organs of speech, especially of the tongue and lips. His work and alphabet were perfected by a group of patient observers, chief among whom was Henry Sweet. Under his guidance the English school assumed a large mass of doctrine, together with a terminology which must be called pseudoscientific, at least in large part. None the less the tenets and the terminology of the school spread abroad, first to Scandinavia, the United States, and France, then to Germany, Italy, and Spain. The English school has been dominant, the world over, for more than a quarter of a century, except in so far as it has had to divide the honors with experimental phonetics. See DEAF MUTE; VISIBLE SPEECH

The origin of this great modern movement in phonetics may be traced to a committee appointed in 1874 by the Société Linguistique de Paris to report on the possibility of studying the phenomena of speech by means of instruments. Louis Havet was the leading spirit of the committee. He received aid and encouragement from the ingenious master, Etienne Marey, at whose laboratory he met Dr. Rosapelly, a physician of Paris, who contrived several of the instruments used in the research. It was in 1885 that the Abbé Rousselot, acting on a hint of Gaston Paris, conceived the idea of applying instruments to the study of sounds of speech. In time he learned of the experiments of Louis Havet's committee, was guided by Dr. Rosapelly and Charles Verdin, and began to publish in 1891. He was destined to be considered the founder of the "new science," and his laboratory at the Collège de France has long been the best and most famous in the world. The experimental method spread rapidly. In the United States work in this line was done as early as 1890 by E. S. Sheldon, C. H. Grandgent, and Raymond Weeks, who were followed later by F. M. Josselyn, E. W. Scripture, and others. The development of the experimental method in phonetics has paralleled that of the same method in psychology. At present instruments exist for recording, among other things, the vibrations of the larynx, the movement of

the soft palate, that of the lips, that of the lower jaw, the points of contact of the tongue against the palate, the air pressure measured from within the mouth or from the lips.

A final word concerning phonetic alphabets. Hundreds of such alphabets have been proposed, but the only one that has made progress and that bids fair to become general (of course, with modifications) is that of the Association Internationale Phonétique. This alphabet took form between 1885 and 1889, in the hands of Paul Passy. He adopted several letters from A. J. Ellis, the author of *Early English Pronunciation*, and profited from the notations of Bell and Sweet. He founded the *Maitre Phonétique* in 1889, and this influential journal appears entirely in the dress of the International Phonetic Alphabet.

PHONETIC SPELLING. Spelling according to sound. See ORTHOGRAPHY; SHORTHAND; SPELLING REFORM.

PHONETIC WRITING. Writing according to sound. In the case of languages which have not previously been reduced to writing and thus acquired a stereotyped orthography, phonetic writing is necessarily regularly employed. In this way many Polynesian, African, and American Indian dialects have received a written form. In languages that already possess an established orthography phonetic writing is employed either in shorthand or in so-called spelling reform. In the former case the phonographic shorthand signs are afterward transliterated into the conventional orthography. In the latter instance the sound as heard by the writer is preserved at the expense of the etymology and very frequently of consistency, the same word often being variously written in phonetic spelling by different writers, and with a more or less cumbersome system of arbitrary diacritical letters. In indicating the exact pronunciation of words whose orthography does not represent the sound, some exact system of phonetic writing is usually employed. At present the most commonly used system of signs is that adopted by the International Pho-

netic Association (*Association Internationale Phonétique*). See INTERNATIONAL LANGUAGE; ORTHOGRAPHY; PHONETICS; SHORTHAND; SPELLING REFORM.

PHONOGRAPH (from Gk. *φωνή*, *phōnē*, sound, voice + *γράφειν*, *graphein*, to write). The first mechanical device for the registering and reproduction of speech or other sound was the invention of Leon Scott, known as the phonautograph and constructed in 1855. It consisted simply of an ellipsoidal barrel. In this apparatus the sound receiver was open at one end and closed at the other. From the closed end projected a small tube, across which was stretched a flexible membrane, to the centre of which by means of sealing wax was affixed a bristle, which acted as a stylus and vibrated with the membrane. In front of the membrane was placed a horizontal cylinder, which was wrapped with a sheet of paper, covered with a thin layer of lampblack, against which the bristle rested lightly. Any sound vibrations entering the ellipsoid were transmitted by the membrane to the stylus, which, when the cylinder was made to revolve and to advance slowly, described on the lampblack surface a wavy line which was thus practically a phonographic record of whatever vibrations had been produced.

It occurred to Charles Cross in France that a metal record of the wavy line traced on the lampblack could be made by photo-engraving, and on April 30, 1877, he deposited with the French Academy of Sciences a sealed packet in which this idea was described, but he made no effort to reduce it to practice. In the meantime the invention of Leon Scott had been realized in useful form as a piece of laboratory apparatus by the eminent physicist and instrument maker König of Paris and was familiar to students of acoustics. It embodied the essential principles on which sound recording and reproducing instruments of the present day are based; but nothing practical was accomplished until 1877, when Thomas A. Edison (q.v.) constructed a machine in which a receiving funnel was substituted for the ellipsoid, an iron diaphragm for the membrane, a sharp metallic point for the bristle, and a tin-foil-covered cylinder for that coated with lampblack. There was, however, the essential difference that the sound vibrations were now indented rather than traced on the surface of the cylinder. By reversing the machine—i.e., by causing the stylus to travel over the spiral line indented by the recording point—the original sound was reproduced by the diaphragm. Mr. Edison at this time also filed patents for a disk phonograph, but did not put this idea into practice until many years afterward, when disk machines long had been manufactured by other persons.

The wonder and novelty of this invention roused great excitement and interest at the time, and very sanguine expectations of its future utility were held. Mr. Edison saw its possibilities and enumerated in the *North American Review* in 1875 a number of applications, several of which it may be said took many years to realize; and in fact one of these, the use in connection with the telephone to record conversation, was not perfected until 1914. (See TELESCRIBE.) The chief reason why the phonograph of those days did not realize immediately the hopes of its inventor and promoters was because, after a few repetitions, the record was effaced from the tin foil so that the instrument

was an interesting scientific toy rather than one of practical utility. Owing to the preoccupation of Mr. Edison with other inventions, the phonograph lay dormant, but in 1885 Bell and Tainter invented the graphophone (q.v.), wherein a wax cylinder was used for the record and an up-and-down line was cut rather than indented in the wax. In 1887 was patented the gramophone (q.v.) of Emil Berliner, wherein the sound vibrations of a diaphragm were recorded on a disk as a wavy line in a horizontal plane instead of as a vertical cut made in a cylinder. This line was traced in a continuous spiral, there being no screw for advancing the recording and reproducing element of the instrument.

In 1888 Mr. Edison, who by this time had returned to the consideration of the phonograph, perfected and placed on the market a commercial machine which was far more elaborate as well as more practical than its predecessor. The tin foil had given place to a wax cylinder which was slipped on and off a central mandrel on which it was revolved by an electric motor, while separate recording and reproducing devices were developed, wherein a glass diaphragm was used for recording and one of mica for reproducing. The cutting stylus connected with the under-surface of the glass diaphragm and vibrating in unison with it had a cup-shaped sapphire point ground to a fine edge, and the reproducing stylus carried by the mica diaphragm was also pointed with sapphire, but was ball-shaped so that it would follow the minute cut or groove traced by the recording point and communicate the corresponding movement to its diaphragm, in both cases the stylus being advanced along horizontally.

From these fundamental inventions modern appliances for reproducing sound have been developed, and various trade and other names have been applied to the different machines by their manufacturers. "Phonograph" has been used for all classes of sound-reproduction machines, though strictly it applies only to those developed by Edison and his associates. Some persons have desired to restrict the term "phonograph" to cylinder machines and reserve that of "gramophone" for those using disks, but this has been complicated by the manufacture of later Edison phonographs using disks for records. The term "talking machine" is used also; but as the reproduction not only of vocal but of instrumental music is one of the leading functions, this is naturally inadequate. In short, it is rather usual to apply the special trade name where the more general term "phonograph" is not used.

Each of the early machines mentioned was immediately developed by its inventors and indeed in many cases by those with scarcely less genius who became associated with them; and each in a way contained essential elements now seen in the modern instrument for reproducing sound and early adopted where not patented or patentable, or after the expiration of patents. Thus, the employment of wax as the medium for the record first used in the graphophone was soon utilized in the phonograph and gramophone, while the spring-driven motor took the place of the hand crank and, for most machines, the electric motor.

As a means of recording sound for reproduction in the general interchange of ideas or intelligence, the phonograph was slow in commending itself to favor; but as a means of re-

producing for amusement music, songs, speeches, recitations, etc., it soon established itself. In 1897 the manufacture of disk records began in the United States for instruments which were sold only for reproduction, as distinct from those available also for recording; and straightway the manufacture and sale of these records became an important and recognized industry, as the accompanying statistics testify. The cylinder machines, after they had been put on a practical basis, naturally had developed into commercial dictating machines later to be known as dictaphones or dictographs, for use in commercial letter writing and correspondence and especially for typing letters without the medium of stenography, for instruction in languages, and for obtaining permanent vocal records available at any time for reproduction. These functions at first did not secure general or wide acceptance, and the extent of use of the cylinder machines was rather limited in comparison with the amusement possibilities of the disk machines with their unending supply of new records of popular songs and other music as well as droll stories and recitations, which soon gained for them a profitable vogue. This led the manufacturers of cylinder machines to realize that they too were available for amusement purposes, and special machines of this kind were placed on the market, as well adapted for use in public places where by depositing a coin they could be heard in operation for a limited time. Difficulties were involved in the wholesale manufacture of cylinder records that had not been experienced by those making disk machines, though they too had had their years of ceaseless effort and costly experimenting to develop their product to a point of efficiency; but Mr. Edison found that, by gold-plating the original wax record and then by backing up the film of gold with copper, he was able to make a matrix from which any number of commercial records could be made speedily and accurately.

Naturally the manufacture of records became a vast industry, and endless care is required to maintain an ever-improving standard that will represent adequately good musicians or the more popular music as rendered by band, orchestra, or individuals. Not only musically and acoustically are the greatest pains required, but in the material and the methods employed the highest technical skill must be used with almost incredible refinements. Thus, the inability to secure certain pure chemicals from Germany after the outbreak of war in 1914 threatened to embarrass the Edison works until their own chemical laboratories were so arranged as to be able to supply the necessary materials of suitable purity.

In making the familiar disk records the laboratory is arranged to secure the best possible acoustic results. If a number of musicians are employed, they are so arranged about the horn of the recording instruments that the sound is concentrated or blended as desired. A special wax composed of stearin and paraffin is used for the disks, and when the record is duly made it is electrotyped with copper and then with nickel in order to give it a hard wearing surface. For the records to be used on the machines also, the material must be carefully selected and the disk itself made so that it not only will take properly the impression of the matrix, but also will be durable and wear well under the needles. It is made of shellac, wood charcoal, barium sulphate,

and earth-coloring matters. The matrix is heated and then placed in the warm plastic material, where it is pressed, cooling plates for both halves of the matrix being applied so that

VICTROLA SHOWING WOODEN CABINET WITH RESONANCE BOX FOR STRENGTHENING THE SOUND.

the mixture hardens quickly and can readily be removed.

It is obviously impossible to discuss the various refinements that have been introduced into talking machines by the exercise of the highest skill and patience on the part of the large staffs of investigators and engineers maintained by the great manufacturing companies. Each part has been developed with skill and pains, and improvement has followed improvement almost imperceptibly, yet markedly improving the quality of sound. Early was speed regulation tested, and the fitting of a proper clockwork motor was not the least of the early important achievements. Naturally sound box, needles, and levers have been developed and perfected, the horn formerly used in reproduction to strengthen the emitted sound was developed, later to be discarded on account of the impairment of quality of the sound owing both to the shape of the horn and also to its material. As a result more attention was given to the wooden resonance box of the accompanying cabinet. The swinging arm and its connecting tube also presented interesting features for improvement, while obviously the size, nature, and mounting of diaphragms

SOUND BOX AND DIAMOND-POINT OF EDISON DISK MACHINE.

have always been a fertile field, and the reproducing needles, either of steel, sharp-pointed fibre for softer tones, or diamond-pointed, as in the case of a late phonograph of disk type, all mark improvements.

In the use of the phonograph, aside from the applications already mentioned, must be con-

sidered its important function in bringing the best work of great musical artists within the reach of all, and its educational influence in spreading a knowledge and appreciation of the world's great operas and other music. Hardly a place is now so isolated that its inhabitants cannot be edified or amused by music, classic, popular, or of sacred character, while the universal spread and more general interest in dancing that took place about 1913 were aided materially by the phonograph, as only in this way was suitable music available for practice and for small gatherings beyond the reach of orchestra or pianist. Conversely, this aroused interest in dancing had its effect on the use and sale of phonographs, materially increasing the growing demand for these machines.

Mention should be made also of a rather serious use of the phonograph, viz., as a permanent record of the voices of distinguished men and women. In 1903 Austria established a bureau for preserving phonographic records, in 1906 such a department was inaugurated at the British Museum, and in 1907 at the Paris Opera House records of great singers were made as a beginning of a collection to be preserved for the benefit of posterity. In the United States, at various centres, important records have been deposited, and the great manufacturing companies have in their vaults original masters'

SOUND BOX AND NEEDLE OF VICTOR MACHINE.

records of artistic and historic importance as well as of priceless sentimental and intrinsic value.

The substitution of disks for cylinders brought about most unexpected and unforeseen results, artistic and commercial. The entrance of new competitors into the field proved a powerful stimulus for constant improvement, so that it would seem that, as far as the reproduction of a solo instrument or solo voices is concerned, the point of perfection has been reached. But the reproduction of mass effects, whether from a chorus or an orchestra (especially the latter), is still far from satisfactory as far as distinction of the various timbres or "clang" effects is concerned. An approximate idea of the vastness of the phonograph industry may be formed from a knowledge of the royalties paid to individual artists. In the case of some of the greatest singers these sums vary from \$10,000 to \$100,000 a year. From a purely artistic standpoint the invention of the phonograph never can be overestimated. It has brought immortality to the reproducing artist also, whose art is thus preserved for future generations. The phenomenal

growth of the appreciation of serious music in the United States (see ORCHESTRA) is owing largely to two factors, the phonograph records and the perfection of the player piano. (See PIANOFORTE.) Quite recently phonograph records have been made of entire operas. Works of such length naturally require several disks—*Aida*, e.g., requires 17.

The extent in the increase in the use and manufacture of phonographs and graphophones can be appreciated best by referring to the volume on "Manufactures," in the *Thirteenth Census of the United States, 1910*, vol. x (Washington, 1913). Here it is stated that, while in 1889 there were but two establishments engaged in the manufacture of these instruments and their records, in 1899 there were 11, with a capital of \$3,348,282 and an annual output valued at \$2,246,274; in 1909 there were 18 establishments, with a total capital of \$14,363,361 and an output valued at \$11,725,996. Of the 18 establishments in the industry, 8 reported the manufacture of phonographs or graphophones, some of which also made other products of the industry, 3 made records and blanks only, and 7 reported the manufacture of parts, supplies, etc.

The number and value of the various products in 1909 are given herewith:

PRODUCT	Number	Value
Phonographs and graphophones	344,681	\$5,406,684
For disk records	191,990	3,224,720
For cylinder records and office dictation	152,691	2,181,964
Records and blanks	27,183,959	5,007,104
Disk records	8,572,805	2,567,717
Cylinder records and blanks	18,611,154	2,439,387
All other products		1,312,208

Considered on the score of value, these various items may be compared with those listed in previous censuses of manufactures as follows.

PRODUCT	1909	1904	1899
Phonographs and graphophones	\$5,406,684	\$2,966,343	\$1,240,503
Records and blanks	5,007,104	4,678,547	539,370
All other products	1,312,208	2,592,185	466,401
Total	\$11,725,996	\$10,237,075	\$2,246,274

These figures, which are the latest available, are useful as indicating the status and growth of an important industry, but they would be considerably exceeded were later statistics available in which the growth owing to increased interest in dancing, the more general adoption of dictating machines in commercial offices, and other circumstances are taken into consideration. Exports of phonographs and graphophones from the United States in 1914 amounted to \$2,512,680. See GRAMOPHONE, GRAPHOPHONE; SOUND, REPRODUCTION OF; TALKING MACHINE.

Bibliography. The sources of information for the phonograph are not so general and so available as the importance of the instrument seems to warrant. The advertising matter of the large companies may be consulted with profit, and for Edison's work reference may be made to Dyer and Martin, *Thomas A. Edison: His Life and Inventions* (New York, 1910). For the invention and development of the gramophone, consult papers of great interest in the

Journal of the Franklin Institute, vols. cxxv, cxxvi (Philadelphia, 1888, 1913). For the manufacture of phonographs and gramophones by most modern mechanical methods, persons interested should read papers in the *American Machinist*, vols. xxxvi, xxxvii (New York, 1912). An interesting phonetic study, based on vibrations of sound as recorded on a phonograph, was made by Dr. E. W. Scripture, *Researches in Experimental Phonetics*, published by the Carnegie Institution (Washington, 1906).

PHONOGRAPHY. See SHORTHAND.

PHONOLITE (from Gk. φωνή, *phōnē*, sound, voice + λίθος, *lithos*, stone). An igneous rock of porphyritic texture which has a chemical composition essentially equivalent to nephelite syenite (q.v.) and generally contains porphyritic crystals of feldspar (sanidine) and nephelite. Most phonolites have been poured out at the surface of the earth as lavas; as, e.g., in the Auvergne of central France and in the Cape Verde Islands. Many phonolites possess a platy parting or separation by cracks into a series of parallel plates, so that they give out a peculiar clinking sound when struck with a hammer. On this account they were formerly known as clink-stones. More subject to alteration from atmospheric agencies than most other rocks, they soon lose their fresh appearance, and frequently show the development of crystals of the zeolite minerals.

PHORADENDRON. An American plant. See MISTLETOE.

PHORBAS (Lat., from Gk. Φόρβας). 1. A son of Lapithes and Orsinome, who freed Rhodes from snakes and was honored by the inhabitants as a hero. He was called *ophiuchus* (the snake holder) and received a place among the stars. In another legend, Alector, King of Elis, secured his assistance against Pelops, and gave him his daughter, sharing the Kingdom with him. 2. A companion of Æneas. The god of sleep assumed his form in order to deceive Palinurus. Consult Vergil, *Æneid*, v, 838 ff.

PHORCUS, PHORCYS, or PHORCYN. In Greek mythology, an aged divinity of the sea. Hesiod and others make him the son of Pontus and Gea and brother of Nereus and Ceto. By the latter he became the father of the Graces and the Gorgons, who are hence called Phorcidæ or Phorcydæ. He was also the father of the nymph Thogsa, who became the mother of Polyphemus, the Hesperides, and the Sirens.

PHORMIO, fôr'mi-ô. A lively and interesting comedy by Terence, produced in 161 B.C. It takes its name from the parasite in the play, which was modeled on the Έπιδουκάδμενος of Apollodorus. From this comedy Molière drew the plot of his *Fourberies de Scapin*.

PHOROMETER. See OPTOMETRY.

PHORONIS (Neo-Lat., from Gk. Φορωνίς, relating to Phoroneus, from Φορωναίς, *Phorōneus*, Phoroneus, an ancient Greek king of Argos). A marine, wormlike animal which has recently been placed in a class by itself (Phoronidea). It lives socially, each worm inclosed in a membranaceous or leathery tube. The body is long, slender, not segmented, and around the mouth is a crown of long, delicate, ciliated tentacles, borne on a horseshoe-shaped lophophore. It is hermaphroditic, developing from eggs, and never asexually from buds. The larva is very remarkable; it is a modified trochosphere and is called an actinotrocha. It may be recognized by the large hoodlike lobe overhanging the mouth, while

there is a postoral circle of large ciliated finger-like tentacles; it rapidly metamorphoses into the polyzoon-like adult. It occurs on the coasts of northern New England and in Europe, while another species inhabits the Australian seas. Consult S. F. Harmer, in *Cambridge Natural History*, vol. ii (London, 1899).

PHORORHACHOS, fô'rô-râ'kôs (Neo-Lat., from Gk. *φωρά*, *phora*, motion, from *φέρειν*, *pherein*, to bear + *ῥαχός*, *rhachos*, brier). A gigantic extinct running bird of prey, skeletons of which are found in the Miocene deposits of Patagonia. It was about 8 feet in height and its skull was larger than that of a horse and was armed with a strong hooked beak like that of an eagle. The wings were small and useless, and the legs long and strong and provided with powerful talons. It appears to have been a swiftly running bird, like the ostrich, though actually related to the herons. Consult F. A. Lucas, "Animals of the Past," in *American Museum of Natural History, Handbook Series*, No. 4 (New York, 1913).

PHOSGENE GAS (from Gk. *φῶς*, *phôs*, light + *-γενής*, *-genês*, producing, from *γίγνεται*, *gignethai*, to become), CARBONYL CHLORIDE, or OXYCHLORIDE OF CARBON, COCl_2 . A colorless suffocating gas, formed by exposing equal volumes of carbonic oxide and chlorine to the action of sunlight. If brought into contact with water, phosgene gas rapidly decomposes into carbonic and hydrochloric acids. It may be readily condensed to a liquid, boiling at 8°C . (46.4°F). It is used in chemical laboratories, as it readily reacts with various substances, so that many organic syntheses can be carried out with the aid of it. It is employed also in the manufacture of certain coal-tar dyestuffs. Phosgene was first prepared by J. Davy in 1811, the name he used indicating that the substance was formed under the influence of light.

PHOSPHATE. The term "phosphate" is applied chiefly to amorphous deposits of phosphate of lime. This substance may occur in the form of (1) beds interstratified with other sedimentary rocks; (2) nodules or grains in limestones and shales; (3) bone beds mixed with a certain amount of phosphatic material; (4) replacement deposits; (5) cavity deposits; (6) gravel deposits; and (7) residual deposits. Not all of these types are necessarily of sufficient richness to be workable. The chief minerals in phosphate appear to be amorphous collophanite (a solid solution of calcium carbonate in calcium phosphate) and crystalline dahllite ($3\text{Ca}_3(\text{PO}_4)_2 \cdot \text{CaCO}_3$). Phosphates of iron or aluminium may be present in small amounts, while other substances include calcite, quartz, clay, etc. Iron and alumina are the most objectionable impurities, and phosphate is sold under a guaranty not to exceed 2 to 4 per cent of these.

Phosphate deposits are formed through the agency of surface waters. The material may be precipitated from sea water, the purity of the deposit varying with the quantity of other materials laid down on the ocean floor at the same time. In other cases the lime phosphate may be leached out of phosphatic limestones, guano deposits, or bone beds, by downward-percolating ground waters, and later redeposited in cavities, or by the replacement of limestones.

A third process involves the leaching of lime carbonate from phosphatic limestones, leaving the phosphate behind. Phosphate deposits are

of world-wide distribution, occurring in formations ranging from the Silurian to Recent. In Florida they form a crescent-shaped belt paralleling the west coast, and occur as irregular masses replacing Tertiary limestones, or as

gravel deposits. Of great importance are the residual phosphates found in the Silurian of Tennessee and known as brown phosphates. What are perhaps the most extensive phosphate beds of the world occur in the Permian beds of parts of Utah, Idaho, Wyoming, and Montana. Their inaccessibility serves to preserve them as a store for the future. Among the foreign deposits those of Algiers and Tunis yield an abundant supply.

The production in 1914 was as follows:

	Long tons	Value
Florida.....	2,138,891	\$7,354,744
South Carolina.....	106,909	415,039
Tennessee.....	483,203	1,822,770

PHOSPHATE, ODORLESS. See THOMAS SLAG. **PHOSPHATES** (from *phosphorus*), IN PHYSIOLOGY. The following phosphates play an active part in the chemistry of the animal body.

Sodium phosphate occurs in three forms, Na_3PO_4 , Na_2HPO_4 , and NaH_2PO_4 , called respectively the basic, neutral, and acid salts. These are all soluble in water. By exposing the second of these salts to a red heat pyrophosphate of sodium, $\text{Na}_2\text{P}_2\text{O}_7$, is formed, and by similarly treating the third metaphosphate, NaPO_3 , results. Phosphate of sodium in one or the other of the above forms is a constituent of all the fluids and soft tissues of the body, and is especially abundant in the urine and bile. The pyrophosphate and metaphosphate are found in the ashes of animal tissues after incineration,

but they result merely from the action of heat on the neutral and acid salts. The salts of sodium are always associated with the corresponding salts of potassium, and what is said of the derivation, elimination, and physiological importance of the one is equally applicable to the other, except that the potassium salts are more depressant in their action. The alkaline phosphates obviously are derived from the food, being either ingested as such or converted within the organism from other alkaline salts. Elimination is effected chiefly through the kidneys and intestinal canal. In the carnivorous animals, whose blood is much richer in phosphates than that of herbivora, these salts are carried off by the urine; but in consequence of the formation of free acids as products of the disintegration of the tissues, a portion of the base is abstracted from the originally alkaline phosphates and a corresponding portion of phosphoric acid is liberated. The originally alkaline salt is thus rendered neutral or even acid. In the herbivorous animals, on the other hand, the urine contains little phosphate, most of the phosphoric acid of their food being eliminated by the intestinal canal in the form of the insoluble phosphates of lime and magnesia. Although the general distribution of the phosphates of the alkalies in the nutrient fluids (there is 40 per cent of them in the ash of the blood cells, 28.4 per cent of phosphoric acid and 23.5 of potash in the ash of cow's milk, and about 70 per cent of phosphoric acid in the ash of the yolk of egg) is in itself an indication of their importance, the exact nature of their functions is not completely understood. Liebig and others have drawn attention to the peculiar grouping of the acid and alkaline fluids of the animal body. The permanence of this grouping is maintained, especially in herbivorous animals, chiefly by the conversion within the body of alkaline and neutral phosphates into acid phosphates by the means already described. Moreover, the proteins are so closely connected with phosphates that they remain associated during the solution and subsequent reprecipitation of these substances, and the ash of developed tissues (such as muscle, lung, liver, etc.) always affords evidence that acid phosphates existed in the recent tissue; further, no exudation from the blood vessels can undergo transformation into cells and fibres, or, in other words, become organized, unless phosphates are present. Another proof of the share taken by the phosphates in the formation and functions of tissue is the fact that, although herbivorous animals take up a very small quantity of phosphates in their food, and although their blood is very poor in these salts, their tissues contain as large a proportion of phosphates as the corresponding parts of carnivora. The fact that one equivalent of the alkaline phosphate of soda, Na_2HPO_4 , possesses the property of absorbing as much carbonic acid as two equivalents of carbonate of soda leads to the belief that the power of attracting carbonic acid, which the serum of the blood possesses, is due as much to the phosphate as to the carbonate of soda, and that, consequently, phosphate of soda plays an important part in the respiratory process. The phosphates, further, play an important part in the forming of hydrochloric acid in the stomach, setting this acid free from common salt (sodium chloride).

Phosphate of lime occurs in the organism in three forms, viz., as normal calcium phosphate,

$\text{Ca}_3(\text{PO}_4)_2$, monocalcium phosphate, $\text{Ca}(\text{H}_2\text{PO}_4)_2$, and dicalcium phosphate, $\text{Ca}_2(\text{HPO}_4)_2$. The normal phosphate occurs in all the solids and fluids of the body, but is most abundant in the bones, in which it amounts to about 57 per cent, and in the enamel of the teeth, of which it forms from 80 to 90 per cent. It may at first sight appear inexplicable how a salt so perfectly insoluble in water as normal phosphate of lime can be held in solution in the animal fluids. In some fluids, as the blood, it is probably, in part at least, combined with albumen, with which it forms a soluble compound; while in other fluids, as the urine, it is held in solution by a free acid or by certain salts (as, e.g., chloride of sodium). When too small a quantity of this salt is taken with the food the bones lose more or less of their hardness and firmness and fractures do not readily unite. Phosphate of lime, like the phosphates of the alkalies, is indispensable to cell formation; and in the mantle of the mollusks (where new cells for the formation of shell abound) this salt is far more abundant than in any other part of the body. Although by far the greater quantity of the phosphate of lime found in the body has doubtless preëxisted in the food, yet it is unquestionable that a part of it is formed within the organism by the action of carbonate of lime on the phosphoric acid that is formed during the disintegration of the phosphorus-containing tissues. In man and carnivorous animals a certain portion of the phosphate of lime is eliminated by the kidneys and the rest is carried off in the excrements, while in herbivorous animals the whole is carried off in the excrements. The acid phosphate of lime is occasionally found in the urine of man and carnivorous animals, but is of no practical importance. In milk phosphate of calcium is united with casein. The curdling of milk by rennet, as well as coagulation of the blood, is greatly aided by the presence of calcium phosphate.

Normal phosphate of magnesia, $\text{Mg}_3(\text{PO}_4)_2$, is analogous, both in its chemical and physiological relations, to the corresponding salt of lime, with which it is always associated. The abundance of this salt in cereals and vegetables explains its presence in the system. A far less amount of this salt than of the corresponding lime salt seems to be required by the organism, as is shown by the relative quantities in which they occur in bone (57 of the former to 1.3 of the latter), and as is further indicated by the fact that, relatively, far more of this than of the lime salt escapes intestinal absorption and appears in the excrements.

The only phosphates remaining to be noticed are the *phosphate of ammonia* and *magnesia*, or triple phosphate, $\text{MgNH}_4\text{PO}_4 + 6\text{H}_2\text{O}$, which occurs in beautiful prismatic crystals in alkaline urine and urine that is beginning to decompose, and the *phosphate of soda and ammonia*, which is occasionally found as a crystalline sediment in fermented urine.

PHOSPHATIC DIATHESIS, or **PHOSPHATURIA** (Neo-Lat., from *phosphate* + Gk. *ούρον*, *ouron*, urine). The excretion in excessive amounts of the earthy salts of phosphoric acid in the urine. Phosphoric acid is excreted in combination with the alkaline bases, sodium and potassium, and the earthy bases, calcium and magnesium. The alkaline phosphates form about two-thirds of the whole and are always held in solution; the earthy phosphates form

about one-third and are spontaneously precipitated under certain circumstances as phosphatic deposits and calculi. One of the causes of such deposition is an alkaline condition of the urine. The urine in health may be temporarily alkaline from eating much fruit or vegetables containing citrates, tartrates, or malates of potassium and sodium. These are converted into carbonates in the intestines and absorbed as such into the blood, and diminish the acidity of the urine or render it alkaline. The urine is sometimes turbid from a white deposit of the amorphous calcium phosphate ($\text{Ca}_3\text{P}_2\text{O}_8$). This may be mixed with a crystalline phosphate ($\text{CaHPO}_4 + 2\text{H}_2\text{O}$), the so-called stellar phosphate, or a phosphate of magnesia ($\text{Mg}_3\text{P}_2\text{O}_8$). A more common condition, however, is that observed when a feebly acid or neutral urine is heated and a thick white deposit or turbidity occurs. In urine which has undergone ammoniacal fermentation there occurs a precipitate of the ammonio-magnesium or triple phosphate ($\text{MgNH}_4\text{PO}_4 + 6\text{H}_2\text{O}$) in the form of minute triangular prisms.

It has been thought that there is a relation between the activity of the nervous system and the excretion of phosphoric acid. An increased amount is seen in the urine after excessive mental work or worry. This phenomenon is observed also in many diseases characterized by wasting and debility, such as phthisis, leucocythæmia, acute yellow atrophy of the liver, and severe anæmias. The old term "phosphatic diathesis," signifying a constitutional tendency or habit of body that produced or promoted a deposition of the phosphates from the urine, is no longer recognized.

PHOSPHATIC FERTILIZERS. See MANURES AND MANURING.

PHOSPHATIC SLAG. See THOMAS SLAG.

PHOSPHINE, fōs'fīn or -fēn. See PHOSPHORUS.

PHOSPHOR BRONZE. An alloy (q.v.) consisting of copper, zinc, and tin in various proportions, with a small quantity of phosphorus which has been introduced in the form of phosphor tin. The addition of phosphorus was first suggested by Montefiore and Kunzell of Liège, Belgium, in 1868. The addition of phosphorus has the effect of eliminating the oxides and, by causing the tin to assume a crystalline structure, increases the homogeneity of the alloy and thereby its elasticity and absolute resistance. In consequence phosphor bronze has met with considerable demand where special strength or power of resisting wear is required, as in the case of bearings for quick-running machinery and screw propellers. See ALLOY.

PHOSPHORESCENCE. It has been observed that many bodies continue to emit light in a darkened room after having been exposed to sunlight or some other strong source of light. This phenomenon is called phosphorescence. Although the name is evidently derived from "phosphorus," it should be noted that the cause of the luminosity of phosphorus is a slow oxidation and is not due to its having been previously exposed to light. Phosphorescence itself is a special case of fluorescence (q.v.), and cases where there are permanent chemical changes are excluded. Those substances which phosphoresce most brilliantly are the sulphides of barium, calcium, and other alkaline earths, diamonds, sugar, etc. It has been found that the phos-

phorescent light is often brilliantly colored and also that the color of the light to which the body is exposed in order to excite phosphorescence has a very important influence upon the intensity of the phosphorescent light itself. It is observed that the same law connecting the exciting light and the phosphorescent light holds true as was noted in the case of fluorescence, viz., that the phosphorescent light is of a longer wave length than the exciting light. Nearly all bodies showing fluorescence show phosphorescence when in the solid state, as e.g., if when liquid they are dissolved in gelatin and then dried. One of the earliest and most important investigations of phosphorescence was made by E. Becquerel, who made a special study of the interval of time phosphorescence would continue after the phosphorescing body was removed from the light. He invented an instrument known as the phosphoroscope, which enabled him to measure with the greatest exactness the small intervals of time involved in the phenomena. He observed that many bodies in which by ordinary means of observation there was no trace of phosphorescence can be shown to phosphoresce for minute fractions of a second. For instance, after exposure to sunlight, calcite shines with orange-colored light; aragonite gives a greenish light, as does lead glass also; uranium glass shines with a greenish light which lasts for about one-thirtieth of a second, although it has its maximum intensity at about one three-hundredth of a second after the sunlight has been withdrawn. Sapphires and rubies give a brilliant pure red light, as do almost all the minerals which contain aluminium.

One most interesting feature of phosphorescence is that if a body is phosphorescing, as e.g., a piece of paper covered with Balmain's paint, the application of heat at any one point will destroy the phosphorescence there. This evidently furnishes a method for the study of those portions of the spectra which lie in the infra-red region, i.e., those wave lengths which are too long to affect our sense of sight. For if a strip of paper covered with Balmain's paint is exposed to sunlight for a short time and then taken into a darkened room and so placed that the infra-red spectrum coming from any source falls upon the paper, those places where there is radiation will be made manifest by the disappearance of phosphorescence owing to the heating effect of the rays of the spectrum.

Within recent years the phenomena of phosphorescence have been reduced to a scientific basis, largely by the work of Lenard and Klatt. These investigators have proved that in order to have a phosphorescent complex it is necessary to have it made up of three parts: (1) a sulphide of one of the alkaline earths, e.g., barium; (2) a trace of a pure metal, e.g., bismuth; (3) a soluble flux, e.g., salts of sodium. The absence of any of these three constituents prevents phosphorescence; and the nature of the light emitted depends upon the character of each of the three parts, as well as upon the temperature. Some writers call the sulphide the luminophos and the metal the electrogen. The most satisfactory theory of the simpler phenomena of phosphorescence is that of J. D. Kowalski (*Philosophical Magazine*, xiii, London, 1907). See FLUORESCENCE; LIGHT.

PHOSPHORESCENCE OF THE SEA. See LUMINOSITY OF ANIMALS.

PHOSPHORIC ACID, H_3PO_4 . An acid com-

pound of phosphorus, hydrogen, and oxygen, first obtained by Scheele in 1777. It may be prepared by carefully heating yellow phosphorus with dilute nitric acid for several hours and driving off the excess of nitric acid by heat. Pure phosphoric acid is a colorless crystalline substance melting at about 41°C . (105.8°F). It is a tribasic acid, the three hydrogen atoms in its molecule being replaced gradually and the result being three series of salts, like NaH_2PO_4 , Na_2HPO_4 , and Na_3PO_4 . The neutral salts of the alkali metals have a strongly alkaline reaction. When heated above 300°C . (572°F), phosphoric acid is converted into pyrophosphoric acid, $\text{H}_2\text{P}_2\text{O}_7$, which was first prepared by Gay-Lussac in 1829. Several of the salts of phosphoric acid are used in medicine. The most important phosphates are described under the names of the metals. See also PHOSPHORUS.

PHOSPHORITE. The massive, concretionary, and mammillary form of apatite, especially the variety found in Estremadura, Spain. The name was first used by Kirwan in describing the phosphates found in Spain, which occur in veins, and in pockets in the Silurian schists.

PHOSPHOROSCOPE (from Lat. *phosphorus*, Lucifer, phosphorus + Gk. *σκοπεῖν*, *skopein*, to behold). An apparatus invented by Becquerel for measuring the duration of phosphorescence in different bodies. See PHOSPHORESCENCE.

PHOSPHOROUS ACID, H_3PO_3 . A tribasic acid formed by the action of water on trichloride of phosphorus. It is a crystalline substance melting at 70°C . (158°F). Its salts are termed phosphites.

PHOSPHORUS. One of the nonmetallic chemical elements. It was discovered by Brandt, a Hamburg alchemist, in 1669, while experimenting with urine with a view to preparing a liquid for the transformation of silver into gold. Kunkel, on learning of the discovery, published, in 1678, a work entitled *De Phosphoro mirabili*. The existence of phosphorus in bones was discovered by Gahn (about 1769), and subsequently phosphorus became a well-known and cheap substance, variously called Brandt's phosphorus, Kunkel's phosphorus, Kraft's phosphorus, Boyle's phosphorus, and English phosphorus, while the name "phosphorus," unqualified, was applied to phosphorescent substances in general until the antiphlogistic nomenclature introduced the present usage. The elementary nature of phosphorus was first recognized by Lavoisier in 1780. See CHEMISTRY.

Phosphorus does not occur free in nature, but is found abundantly in the form of phosphates. The minerals of the apatite group (combinations of calcium phosphate with calcium chlorifluoride) struvite, vivianite, wavellite, and many other minerals, contain considerable amounts of chemically combined phosphorus, but the principal source of phosphorus is still the substance of bones, which consists chiefly of the neutral phosphate of calcium. Calcium phosphate is the chief constituent of coprolites and guanos also, and calcium and magnesium phosphates are found in the ashes of plants. Ammonium-magnesium phosphate is the chief constituent of urinary sediments, while in combination with carbon, hydrogen, oxygen, and nitrogen, phosphorus is found in the yolk of eggs, in the blood and other animal fluids, and in the substance of the brain and nerves.

Phosphorus is sometimes obtained from mineral phosphates. Usually, however, it is manufactured from bone ash, which consists largely of neutral calcium phosphate, $\text{Ca}_3(\text{PO}_4)_2$. The bone ash is treated with sulphuric acid of specific gravity 1.5 or 1.6, the quantity of acid used being exactly sufficient to convert all the calcium present into calcium sulphate. This sets free in solution the phosphoric acid, while the calcium sulphate is precipitated out.

The phosphoric acid is then concentrated and next heated to a dull-red heat, which changes it to metaphosphoric acid, HPO_3 . The latter is finally mixed with sawdust or coke or charcoal and strongly heated in clay retorts, the result being liberation of the phosphorus, while hydrogen and carbon monoxide gases are given off as by-products. The phosphorus vapors are condensed under water in suitable vessels of clay. The crude product thus obtained may be somewhat purified by melting under water and pressing through porous plates. Arsenic, an impurity usually introduced with the sulphuric acid employed in the manufacture of phosphorus, may be removed by means of nitric acid. When pure the phosphorus is melted and cast in the form of sticks by sucking it into glass tubes and allowing to solidify.

The chemical symbol of phosphorus is P; its atomic weight is 31.04. The properties of free phosphorus are not always the same, the element being capable of existing in several different allotropic forms. (See ALLOTROPY.) The vapor of phosphorus has invariably the same density, leading to the molecular formula P_4 . (See MOLECULES—MOLECULAR WEIGHTS.) Experiment leads to the view that when dissolved in benzine phosphorus has a similar constitution. But the remarkable differences between the liquid and the several solid modifications of the element are by no means understood. Common or yellow phosphorus, which is ordinarily obtained by the manufacturer, is a transparent waxy substance that may be prepared in the form of crystals of the regular system by sublimation or by crystallization from solutions in carbon disulphide, in which the other varieties of phosphorus are insoluble. Its melting point is 44.5°C . (112.1°F .) and its specific gravity at 0°C . (32°F .) is 1.837. It phosphoresces in the dark, and it is quite certain that even in inert gases the phosphorescence is caused by the presence of traces of oxygen, which oxidizes yellow phosphorus very readily. As a matter of fact, when kept in a vacuum or in gases which have been thoroughly freed from oxygen, phosphorus gives off no light. In the air, at ordinary temperatures, yellow phosphorus undergoes slow oxidation (see OZONE), and may readily take fire even if carelessly rubbed. It may be caused to burn under water by gently warming the latter and passing a current of oxygen into it. Besides, yellow phosphorus is extremely poisonous. It must therefore be handled with great care. The use of phosphorus for matches is well known. (See MATCHES.) Red phosphorus was discovered by Schrötter, of Vienna, in 1845. It is formed by the action of light on common phosphorus. Red phosphorus may be best made by heating yellow phosphorus in a relatively small closed vessel to about 400°C . (750°F .) and allowing the temperature to fall very slowly between 400° and 250°C . (750° and 480°F .). Red phosphorus may be transformed into yellow by heat-

ing to about 400° C. (750° F.) and cooling the vapor rapidly. Red phosphorus melts at about 630° C. (1134° F.); its specific gravity is 2.14. It does not phosphoresce in the dark, is not poisonous, and is in every way harmless. (See MATCHES.) Crystalline (metallic) phosphorus is formed during the solidification of molten amorphous phosphorus. It may be obtained in the form of long red tabular crystals having a distinct metallic lustre. Its specific gravity is 2.34. Black phosphorus is formed when melted yellow phosphorus is rapidly cooled. Two other allotropic varieties of phosphorus have been described.

Compounds of Phosphorus. Phosphorus forms at least three different compounds with hydrogen, viz., a solid hydrogen phosphide, P_2H_4 ; a liquid phosphide, P_2H_2 ; and a gaseous phosphide, PH_3 , called phosphine. The last-named compound, analogous to ammonia (NH_3), is usually prepared by heating phosphorus with a strong solution of caustic potash. When thus prepared, however, it contains some vapor of the liquid phosphide, P_2H_2 , and as the latter takes fire spontaneously in the air, the impure phosphine, too, is inflammable. But under the influence of light, or by the action of strong hydrochloric or sulphuric acid and certain other substances, the vapor of the liquid phosphide is decomposed; and if pure phosphine is prepared, say, by passing the impure gas through concentrated hydrochloric acid, it is found not to take fire in the air. The odor of phosphine resembles that of garlic and of rotten fish. The oxides of phosphorus include phosphorus trioxide, P_2O_3 , and phosphorus pentoxide, P_2O_5 . The latter, usually termed phosphoric anhydride, is formed when common phosphorus burns in the air. It forms a white, exceedingly hygroscopic powder, taking up water with great energy to form phosphoric acid. With the halogens phosphorus forms a trichloride, PCl_3 ; a pentachloride, PCl_5 ; a tribromide, PBr_3 ; a pentabromide, PBr_5 ; and a triiodide, PI_3 . All these compounds are formed by the direct union of the elements. A trifluoride, PF_3 , and a pentafluoride, PF_5 , are also known.

Phosphorus is a constituent of many tissues, especially the nerve centres, and its physiological action is that of a tonic. In medicine it is used chiefly in nerve exhaustion, myelitis neuralgia, osteomalacia, and rickets. It has been used with success in lupus, acne, and psoriasis. It may be given in a pill or in solution, the latter being the preferable. It may be exhibited dissolved in oil or in chloroform. Phosphide of zinc has been used as a substitute for phosphorus.

Consult F. Dawidowsky, *Glue, Gelatin, Animal Charcoal, Phosphorus, Cements, Pastes, and Mucilages* (2d ed., Philadelphia, 1905). See ANTIDOTE.

PHOSPHORUS (Lat., from Gk. *φωσφόρος*, light bringer). A name of the planet Venus as the morning star, also called Lucifer (q.v.). As an evening star it is called Hesperus and Vesper.

PHOSPHORUS, SALT OF. See MICROCOSMIC SALT.

PHOTEOLIC. See NYCTOTROPIC.

PHOTIUS, fō'shī-ūs (Lat., from Gk. *Φῶτιος*) (c.820–c.891). Patriarch of Constantinople, one of the greatest theologians and scholars of the Greek church. He was a member of a patrician family of Constantinople and during the first

period of his life filled various important public offices. In 857 Bardas, minister of the young Emperor, Michael III, undertook to remove the Patriarch Ignatius (see IGNATIUS, SAINT) from his position, and Photius, after being hurried through all the clerical offices in six days, was put in his place. Pope Nicholas I (q.v.) espoused the cause of Ignatius and excommunicated Photius in 863. The latter maintained his position, supported by the court, and in 867 assembled a council at Constantinople which excommunicated the Pope and his partisans and withdrew from communion with the see of Rome. (See GREEK CHURCH.) The same year Basil I succeeded Michael as Emperor, Photius was desposed and Ignatius reinstated. Ten years later, after the death of Ignatius, Photius was restored, and the Pope, John VIII, was induced to acquiesce. Photius assembled a council in 879, which decided all questions at issue between the East and Rome as he dictated, and in consequence the Pope excommunicated him in 881. In 886 the Emperor Leo banished Photius to an Armenian cloister, and he died there about five years later. Photius is revered by the Greek church, while the Western church accuses him of craft, violence, and perjury. His theological works include the *Amphilochia*, which not only discusses doctrinal and exegetical questions, but treats also of philosophy, science, medicine, grammar, and history; commentaries on the Gospels and Epistles; and a treatise in favor of the Greek doctrine of the procession of the Holy Spirit. The *Nomocanon* ascribed to Photius is of doubtful authorship. His chief literary and scholarly work is the *Myriobiblon* or *Bibliotheca*, a summary review of 280 works which he had read, most of which are now lost. He also wrote a *Lexicon*, for use in reading the classic authors and the Scriptures. A number of Photius' letters are preserved, as well as sermons of much merit. His works are in Migne, *Patrologia Græca* ci-cv. Consult: Joseph Hergenröther, *Photius, Patriarch von Constantinopel* (3 vols., Regensburg, 1867–69); id., *Monumenta Græca ad Photium Spectantia* (ib., 1869); W. F. Adeney, *The Greek and Eastern Churches* (New York, 1908); J. Ruinaut, *Le schisme de Photius* (Paris, 1910).

PHOTOCHEMISTRY. The branch of general chemistry that deals with chemical changes immediately producing or caused by light. In interpreting this definition it must be borne in mind that the combustion of illuminants cannot properly be classed as a form of photochemical changes, for the reason that combustion transforms the chemical energy of the illuminant, primarily not into light, but into heat, the latter then giving rise to the production of light. The chemical changes immediately producing light include those undoubtedly taking place at ordinary temperatures in the fireflies and other luminescent organisms, as well as in the eye. All such changes are as yet very imperfectly understood, and photochemical research has been confined almost exclusively to the opposite phenomenon, i.e., to chemical changes caused by light.

Actinometry. That light is capable of causing chemical transformations was not unknown in the eighteenth century. That silver chloride turns dark under the action of light was known to Schultze as far back as 1727. In the latter part of the century it was recognized that sunlight enables plants to decompose carbonic acid

gas and set free its oxygen, and about 1840 Liebig grasped the full importance of this process in the economy of nature. But all photochemical knowledge remained qualitative until John W. Draper, of New York University, about 1842, introduced the quantitative measurement of the chemical action of light by constructing the first actinometer. Gay-Lussac and Thénard had observed in 1809 that a mixture of equal volumes of chlorine and hydrogen, which may be preserved indefinitely in the dark, reacts with explosive rapidity if exposed to intense light, and slowly if the light is weak. The product of the reaction is hydrochloric acid gas, which is freely soluble in water, while hydrogen and chlorine are soluble only sparingly. To measure the effect of light in causing the reaction, Draper introduced a mixture of precisely equal volumes of hydrogen and chlorine into a glass

DRAPER'S ACTINOMETER.

bulb, *a*, half filled with water and joined to a glass tube, *b*, likewise filled with the gaseous mixture, provided with a scale, and in its turn joined to a wide vessel, *c*, filled with water. He then exposed the upper part of *a* to light, whereupon part of the hydrogen and chlorine combined into hydrochloric acid, the latter was absorbed by the water, and the consequent diminution of the gaseous volume was shown by the length of the column of water entering from *c* into *b*. Draper's actinometer was improved in 1862 by Bunsen and Roscoe. But even the improved form of the apparatus did not permit sufficiently rapid experimentation, and consequently the method was soon abandoned. Instead, Bunsen and Roscoe employed an actinometer which measured the chemical intensity of light by the time required to darken a photographic film to a certain standard degree.

In 1879 Eder devised a new method of actinometric measurement. If a mixture of mercuric chloride (corrosive sublimate) and ammonium oxalate in aqueous solution is exposed to the action of light (especially the ultra-violet rays), a chemical change takes place resulting in the precipitation of mercurous chloride (calomel), the quantity of which measures the chemical intensity of the light. Account must of course be taken of the fact that the amount of calomel precipitated not only depends on the intensity of the light, but is also influenced by the varying concentration of the solution during the experiment.

In 1897 Rigollot constructed an actinometer by immersing into a solution of common salt two copper plates whose surfaces were previously oxidized in the flame of a Bunsen burner, and exposing one of the plates to the light. If the two copper plates of this apparatus are connected by a wire, an electric current is found to flow from the dark plate towards the illuminated one, the intensity of the current being proportional to the intensity of the light and hence being capable of serving as a measure of the latter. It may be observed that the principle of electrochemical actinometry was discovered as far back as 1839, by Becquerel, who found that a current passed between two silver plates covered with films of chloride of silver

and immersed in dilute sulphuric acid if one of the plates was exposed to the light.

General Principles. Passing now to the few known general principles of photochemistry, it must be observed first of all that while it was formerly believed that light of certain colors only (actinic rays) was capable of chemical action, it is now generally admitted that chemical changes can be produced by light of any wave length whatever, including the infra-red and the ultra-violet rays. It is further generally admitted that if a substance is at all incapable of absorbing light, it is also incapable of undergoing photochemical changes of any kind. It is often possible, however, to increase the capacity of a substance for absorbing light by mixing it with other substances that absorb light freely.

When light produces a chemical change it naturally loses more or less of its original intensity, part of its energy being transformed into chemical energy. When, therefore, light passes through a medium in which it causes some chemical change, its intensity is diminished, first through purely optical absorption and secondly through photochemical extinction. Thus, e.g., if light is passed through a given volume of chlorine gas, it is partly converted into heat and its intensity is found to have diminished by a corresponding amount. If now, in a second experiment, light of the same original intensity is passed through a mixture of chlorine and hydrogen, the intensity is found to have diminished by a greater amount than in the first experiment, owing to the photochemical combination of chlorine and hydrogen into hydrochloric acid. The absorption of light by the hydrogen gas present in the second experiment is small and may be left entirely out of account. In either experiment the diminution of intensity may of course be measured by means of one of the actinometers described above.

In conclusion it may be pointed out that if a given substance is capable of undergoing a chemical change both under the influence of light and without this agency, the change in the two cases need not necessarily be quite the same. Thus, it has been proved that the decomposition of hydriodic acid takes place, under the influence of light, according to the equation

i.e., molecule after molecule of hydriodic acid is primarily decomposed into single atoms of hydrogen and iodine. On the other hand, if hydriodic acid is decomposed by heat, without the intervention of light, the decomposition takes place according to the equation

i.e., the molecules are decomposed in pairs, each pair yielding a molecule of hydrogen gas and a molecule of iodine. In recent years excellent work on the action of light upon organic compounds has been done by Ciamician.

PHOTO-ENGRAVING. The art of preparing, by means of the chemical action of light upon certain bodies, an engraved plate or block for printing. There are two forms of this, as there are of manual engraving, viz., engraving in intaglio, in which the ink for printing enters the incised lines and remains there while the rest of the plate is cleaned off; and relief engraving, in which the ink is deposited upon the projecting parts of an engraved block or plate. In either case the paper takes the ink from the surface as in the printing of ordinary manual engravings. Photolithography, the preparation by chemical effects of light of plane surfaces for printing, is treated under LITHOGRAPHY.

Intaglio Photo-Engraving. This is known by the general name *photogravure*, a French term generally accepted in all languages. *Heliogravure* is a term which may be taken as the equivalent of *photogravure*, varying in meaning as does that more general term; but at different times the name *heliogravure* has been given to special patented or secret processes. *Photogravure* may have the appearance of pure line work, exactly as in manual line engraving (q.v.), and it may have the appearance of tint or shade without line, nearly as in the case of mezzotint (q.v.). This form of the art has been carried to so great a perfection by some workmen, especially in France, that it is to be compared only to the finest and most artistic hand work, having in addition to that artistic charm an accuracy of reproduction to which the manual work cannot pretend. In the case of line *photogravure* the facsimile of a drawing or of a print from an engraved plate may be so perfect as to be indistinguishable from the original except by the most minute examination of an expert. Thus, in the published work of Amand-Durand of Paris the facsimiles of fine prints from the plates of Dürer, Rembrandt, Claude, Paul Potter, and other celebrated etchers and line engravers caused astonishment and doubt among collectors of prints when those facsimiles first appeared about 1870. In all these processes, however, hand work has to be called in to complete the plate; and it is a general truth that the most artistic workmen produce the most perfect *photogravures*. In the case of Amand-Durand there was the peculiar advantage that the director himself was a skilled engraver before he undertook the photo-engraved process.

Gelatin treated with bichromate of potash is made insoluble under the action of light. Instead of gelatin some form of albumen may be used, or asphaltum, which is found to answer equally well and to be cheaper. This general property underlies all photomechanical-process work. In making a *photogravure* in line a photographic transparency, or positive, of the drawing, or print, or picture, or object which is to be reproduced is placed in contact with a copper plate coated with asphaltum or albumen mixed with a bichromate, and strong light is allowed to pass through the negative to the sensitized surface. Only those parts where the

light passes through the negative without interruption will be marked by complete insolubility of the gelatin; elsewhere the surface remains soft and capable of being dissolved away by washing. In this way the surface of the prepared plate affected by light is turned into a relief copy of the original. The plate is then etched by an acid, perchloride of iron, which eats it away exactly as in the case of ordinary etching. (See ETCHING.) When it is a line plate which is being prepared no other important steps are necessary; but when the plate is to be a tint plate or gradation plate without line and producing prints much like those taken from a mezzotint, it is usual to prepare the surface of the copper plate in the first place by precipitating upon it a fine powder of resin or of resin and asphaltum in combination. This powdered surface prevents the complete access of the mordant to the metal exactly as in the case of aquatint (q.v.). The granular surface so obtained may be either coarse or indefinitely minute, this depending upon the character of the subject to be reproduced. In this way the reproductions of portraits by the greatest master of refined execution or landscapes of minute detail of most varied character may be reproduced with a perfectness of gradation equal to that of hand work in its highest perfection.

As it is customary to illustrate costly books by means of large *photogravure* plates, so it is usual to employ artists of celebrity to make original monochrome pictures for such reproduction. These are sometimes produced in the more usual fashion by means of water-color work in bistre, sepia, India ink, or other one-colored pigment, but they are also made on a very large scale by oil painting on canvas, exactly as in the case of paintings intended for exhibition or sale, except that they are worked in such gray or brownish-gray pigment as the painter and the photographer agree upon as convenient for the one and most easily adapted to the work of the other. It may be stated, also, that the improvements made in orthochromatic photography have made it possible to obtain very accurately the relative color values of the most difficult subjects, such as elaborate oil paintings.

An original difficulty with the employment of *photogravure* in book work was the great cost, not alone in the production of the plates (for it was, and in the case of the finer work still is, not uncommon to take two or three months in the perfecting of a large plate), but of the printing, which had to be done on a hand press, and slowly, so that every separate impression, of which 50 may be bound up in a folio volume, would cost a definite sum of money over and above the cost of the plates. It is on this account that modified processes are being continually brought forward and used to produce plates from which the printing may be done more rapidly. There is, however, always the difficulty in printing from intaglio engraving, that in order that the paper shall take the ink from the incised lines perfectly, leaving none behind, so that the design is reproduced in every minute particular by the raised pattern of ink on the paper, only a slow and painstaking process will serve.

Methods of *photogravure* have been introduced in which a screen is employed to make the grain exactly as in the case of the half-tone

process described below. This, of course, tends towards much greater ease in rapid printing. Furthermore by a special process photogravure plates are available for rotary power printing, when the design is transferred to a copper cylinder and duly etched in.

Relief Photo-Engraving. This covers all those processes by means of which a surface is prepared like that of a wood engraving, the lines, points, and small surfaces which are to be reproduced upon the paper standing up in low relief from the background, which is cut away. The level surfaces of these lines and points must be exactly true and uniform, all in one plane, except where it is deliberately lowered in one place or another in order that the block at that point shall press the paper less firmly and the ink impression show pale in contrast with other and blacker parts.

One of the most difficult of these processes is that called commonly the gelatin process, or, to distinguish it from others also depending upon gelatin, the swelled-gelatin process, worked out in 1871-72 by John Moss in New York and one of the first practical photo-engraving processes. It is an expensive process and one requiring the greatest care to employ it successfully, but its results are not very markedly inferior to that of photogravure that is not in distinct line. In fact, a good print made by this process may be often taken for a photogravure print of somewhat inferior excellence, without clear black and white, with a too uniform texture and a cloudy rendering of details. A sheet of glass is coated with a film of gelatin sensitized with bichromate of potash and exposed under a black and white negative. The film is then soaked in water and swells up where the opaque lines corresponding to the whites of the design protected the film, while the surface of the film corresponding to the black lines of the design do not swell. The surface is hardened by a solution of sulphate of iron and coated with asphaltum in solution, on which hot wax may be poured. The wax with its asphalt surface stripped from the swelled gelatin by immersion in water gives a relief surface. From the surface so produced a matrix is made, and from this another in a material such as wax, and, again, an electrotype of copper is made and mounted upon a block to give it the requisite stiffness and thickness.

The Woodbury type, the collotype, the artotype, the heliotype, the albertype, and many similar processes are all based upon the properties of certain resinous and glutinous substances and their changes when submitted to light. Asphaltum, albumen, and gelatin are the three used. These processes, however, involving printing from a film of gelatin, made selective of either a greasy ink or water so that it can be printed just like a lithograph stone.

Half-Tone Process. As early as 1852 it was proposed by Fox Talbot to resolve an image into a series of dots of greater or less intensity and then prepare a printing plate. His process involved the use of the discovery of Mungo Ponten that bichromate of potash in contact with organic matter decomposed under the influence of light. Various experiments, some more or less successful, followed both in Europe and the United States, and such process work was actually executed, but modern half-tone as now carried on has resulted from the invention of the mechanical art of ruling lines of extreme fine-

ness, of perfect uniformity in width, and at absolutely equal distances from one another. This, which was not practicable until within comparatively recent years, has now been developed so that plates of glass can be ruled in this way with minutely incised lines, 200 or even in extreme cases 400 to an inch. When two glass plates, each ruled with lines of this sort, e.g., diagonally across the plate, are brought together in such a way that the two sets of lines cross one another, the result is, as seen by transmitted light, a fine network of square or diamond-shaped mesh. The transparent parts or apertures, which are uniform in size, have a total area of about one-third of the entire plate. The half-tone process depends upon this screen, as it is called, and this was first put on a satisfactory basis by F. E. Ives, of Philadelphia, who in 1885-86 united two single line screens as above described. In 1893 Max Levy, of Philadelphia, perfected the process of manufacture and patented a method of ruling and etching the lines into glass and filling in the interstices with a black pigment. The two sets of parallel lines were then united diagonally and cemented together with Canada balsam.

The photographic negative is made by light passing through the ruled screen, placed at a suitable distance in front of the sensitive plate, and the result is an image broken up into minute dots, easily seen with a magnifying glass. There is no absolutely continuous gradation of tint, but everywhere a series of very small dots which constantly increase and decrease in darkness or intensity, conditioned upon the relative lights and darks of the subjects to be reproduced, and which are small enough to produce a general effect of uniform gradation. This negative reversed is placed in contact with a carefully prepared copper plate that has been coated with a preparation of fish glue, bichromate of ammonia, albumen, and water. It is then exposed to the light and afterward washed in water, and those parts protected from the light by the dense portions of the negative will be washed out of the half tones in due proportion. After burning in, i.e., heating over a gas stove, the plate is ready for etching, which is done in the case of a copper plate with perchloride of iron or, if zinc is used, with nitric acid.

The half-tone process requires less artistic sense and ability than, e.g., photogravure, but it requires the neatest handling, the most perfect delicacy of treatment, and it is often necessary for a good block that the acid should be applied in several consecutive rebittings before the surface is perfect. In much of the finest work of to-day the highest lights and delicate tone gradations are very skillfully retouched by an experienced engraver. Much of the reengraving by hand, however, is clumsily done and adds to the shortcomings of poor plates. On the other hand, rapid and ordinary commercial work has made possible the wider illustration of books, magazines, and daily papers, and in the latter, where the greatest speed is essential and a plate with screen coarse enough to be printed on ordinary newspaper, notable developments have been achieved even at the expense of artistic results.

The special utility of the half-tone block is in this, that it can be printed with type in any ordinary press or printing process. In order that this may be done the metal plate is backed up by a block of wood or metal of the right

thickness, so that the surfaces of the prepared metal shall be exactly even with the face of the types. With reasonably careful work in the preparation of the electrotype plates and the like, a page may be printed of typography with pictures of full light and shade embodied in it; the whole printed together, and that even on the power press, the only essential consideration being that the paper on which it is printed shall be smooth finished or, for finest work, coated so as to afford a polished surface.

The Line-Cut Process, or Zinc Etching, gives an exact facsimile of a drawing in solid or dotted black lines. Any drawing an artist will make with a point, as of a pen, or a brush, which does not include tints or half-tones, can be reproduced in exact facsimile. The process is similar to those described above, only a negative of greater intensity is required. The film of such a negative is then removed or stripped from the original plate of glass for printing. The light passing through the negative, made in the usual way, hardens the prepared surface of a polished sheet of zinc, and the unsoftened stuff is washed away, after which the film is powdered with a resinous powder which attaches to the ink image where the albumenized surface has been acted on. The metal plate is then etched with acid. In fact, this may be considered the original process from which the half-tone process has been produced by natural evolution, i.e., by the development along obvious lines. The line-cut block can be used in connection with type exactly as half-tones, at a very much less cost and with greater facility and less care in the manipulation.

Color Printing from Photo-Engraved Surfaces. The most important processes of this kind are these known as the three-color and four-color processes. These have become very familiar and widely used. The system is based upon the scientific fact that all the colors of the spectrum may be obtained from the three primaries, red, blue, and green. The rays of light are separated by means of what are called photographic filters, which are partly transparent substances which allow particular rays to pass, while they stop or restrain others. Thus, one of the three filters will allow only blue rays to pass. By this appliance used in connection with the half-tone process there may be produced a perfect blue picture, and again with the use of other filters a green and a red or approximately red picture. The printing of all these, one upon another, approximates very closely the complete chromatic result desired, i.e., a picture in full color. The first practical work in this field was accomplished by a lithographer in Berlin named Ulrich, who received a medal for results shown at London in 1891, but used a fourth printing, either gray or black, to get strength in his shadows. Ives showed a three-color half-tone print in 1885, and William Kurtz of New York in 1893 exhibited successful work printed from three half-tone blocks that really established the process as a commercial and artistic success. The chief difficulties of the process are in the making of correct negatives, accurate registration in printing, and appropriately colored inks. The result so far may be said to approximate the reproduction of fine manual painting. One obvious reason for this imperfection of the result is found in the inferior effect of colors superimposed to those which are

laid side by side. Every student of painting knows how much more brilliant a gradation can be procured by putting touches of color close together, side by side, than by laying those colors over one another. It is true that much work, especially in oil painting, is done by superimposed color, but this is when the upper coat of pigment is more or less translucent, as when the yellow below shows through the thin glaze of blue to produce a certain quality of green. Commonly the juxtaposition of color is more brilliant than the superimposition of color; and this fact causes an indefinitely great amount of thought and experiment among those who are trying to improve the three-color process. In much of the best color work now a fourth plate is made in one of several ways, and this is printed in black or gray in order to secure depth in the shadows and improve the general appearance.

Other and more complex processes of photographic color work have been introduced in the United States, and some of the results are surprisingly accurate reproductions of the originals. PHOTOEPINASTY (from Gk. *phōs*, *phōs*, light + *ēpi*, *ēpi*, upon + *naōs*, *naōs*, solid, from *naōsein*, *naōsein*, to press close). The action of light in accelerating the growth of the upper sides of dorsiventral organs, such as leaves. See GROWTH.

PHOTOGRAPHIC SURVEYING (from Gk. *phōs*, *phōs*, light + *grāphō*, *grāphō*, to write). In recent times the art of photography has found its way into surveying, an application due chiefly to the French. Its advantage was at once recognized for military and topographical uses, but its value for accurate and extensive surveys is still quite limited, owing to the imperfections of the photographic lens, though it has been employed extensively in the survey of western provinces of the Dominion of Canada. The chief instrument is a view camera provided with cross wires and an apparatus for leveling, though new special cameras to attain increased precision are used. A survey is effected by selecting at least two stations and measuring the base lines between them. Then at each station a series of plates are exposed, the camera being turned at each successive exposure sufficiently to obtain for the series a continuous photograph of the area to be surveyed. The method of executing a map and of calculating heights and distances from photographs is best obtained from works on the subject, but a general idea may be gained from the following. Since the images of the cross wires

FIG. 1.

are photographed on the plate, every point of the field appears in its proper position in relation to the four quadrants of the plate. Thus, in Fig. 1 *HH'* is the image of the horizontal

wire, VV' the image of the vertical wire, and P the image of a church spire. The lines a and b can be measured in the photograph, and, the focal distance f being known, line d can be computed, and, when the distance OA has been determined from the map, the height of the spire above the level of the instrument is given by similar triangles. To plot a survey, the angular distance of any point from the base line is determined by a photograph taken at each end of the base. In Fig. 2 P represents the plate of the camera at station A ; B' , C'

FIG. 2.

being the images of station B and the point C ; the angle $B'OC'$ can be determined from $B'C'$ and the focal length f . Then any point of the map may be plotted as follows: Lay off the base line to a desired scale and draw lines making angles with the base equal to those computed. These will intersect in a point on the map corresponding to the point in the field. See SURVEYING.

PHOTOGRAPHY. The art of producing the appearance of objects and fixing them by means of light on a previously sensitized surface, and the reproduction of the image thus obtained, by various processes, on glass, paper, or other materials. The first photographic camera was in reality a darkened room to which light was admitted through a single small hole in the window shutter. This was the "camera obscura" of Giambattista della Porta, an Italian philosopher, invented by him in the last half of the sixteenth century. When the sun shone brightly, a faint inverted image of a landscape could be seen on the whitened surface of the wall within. The camera obscura of the present time differs very little from Porta's invention, except that it contains a lens in the apex of the roof, with a reflecting mirror above it, in order to throw the light from all the surrounding landscape down through the lens and thus form a panorama on the surface of the table placed in the middle of the room. J. H. Schultze, a German, who has been called the Columbus of photography, obtained the first actual photographic copies of writing as early as 1727, by placing the written characters upon a level surface previously prepared with a mixture of chalk and silver nitrate. The rays of light passing through the translucent paper blackened the silver compound underneath, except where it was protected by the opaque ink

forming the letters themselves, and thus a white copy upon a black ground was obtained.

Scheele in 1777 demonstrated that silver chloride became black quickest by the action of the violet rays of the solar spectrum, thus showing that the rays of light were not equally active. A few years later Professor Charles projected the shadow of a head by means of strong sunlight on a sheet of white paper which had been made sensitive by chloride of silver and obtained a white profile on a darkened surface; but he was unable to fix the image upon the sensitive paper. Meanwhile the members of the Lunar Society, including Samuel Parr, James Watt, Josiah Wedgwood, and others, met regularly at the house of Matthew Boulton at Soho and discussed their experiments, some of which were on the action of light, and it has been shown that an artist named Eginton, in the employ of Boulton, made and sold numerous copies of well-known paintings at very low prices. Thomas Wedgwood, to whom is due the honor of being the first to produce pictures by the action of light on a sensitive surface, published his paper giving "an account of the method of copying paintings upon glass, and of making profiles by the agency of light upon nitrate of silver, with observations by H. Davy," in the *Journal of the Royal Institute* for June, 1802. To Davy credit is due for his discovery that silver chloride was more sensitive than the nitrate; but, notwithstanding his continued investigations, Davy was unable to find a means by which the fading out of the pictures could be prevented. Other investigators took up the subject later, among whom may be mentioned Joseph Niepce and Daguerre in France and William H. F. Talbot in England. The first named, in 1814, succeeded in producing permanent pictures by a process which he called heliography. It consisted in coating with bitumen a piece of plated silver or glass, which was then exposed in a camera obscura during four to six hours. Those portions of the bitumen which were acted on by the light became insoluble, and, by removing the parts unacted upon by certain essential oils in which bitumen was soluble, the shadows of the image were removed, and the lights were represented by the insoluble bitumen that remained on the plate. This process was therefore the forerunner of our modern photo-mechanical methods. In 1824 Daguerre began his experiments, which led to the invention of his celebrated process. He formed a partnership with Niepce in 1829, and 10 years later they announced the invention of the daguerreotype process, the principle of which had been discovered by Daguerre in 1832. The process consisted in exposing a metal plate covered with silver iodide for 20 minutes in a photographic camera, after which the plate was transferred to a dark room and exposed to the vapor of mercury, which developed the latent image, the latter being then made permanent by means of a solution of sodium chloride. Sir John Herschel, who devoted considerable attention to this subject, soon afterward announced the greater suitability of sodium hyposulphite for dissolving the haloid salts of silver; consequently the hyposulphite was adopted as a fixing agent. Daguerre received a pension of 6000 francs from the French government on Aug. 10, 1839, in consideration of which the details of his process were given to the world. Information of this invention reached the United States in

1839 through Samuel F. B. Morse, who communicated it to his colleague in New York University, John W. Draper (q.v.), by whom the first sunlight picture of a human face (that of his sister, Dorothy Draper) was made in 1840. Meanwhile Talbot in England had been pursuing investigations from a different viewpoint, and on Jan. 31, 1839, he presented before the Royal Society a paper on "Pathogenic Drawings." These he produced by dipping writing paper in a solution of sodium chloride, drying, and then transforming the sodium chloride into silver chloride by passing the paper through a solution of silver nitrate. With this paper, which was extremely sensitive to light, he was able to produce a negative that became black by the action of sunlight except where it was covered by some opaque object, which he desired to reproduce, and in turn from this negative, by another exposure, a number of positive prints could be obtained, which were fixed by potassium bromide. Two years later Talbot patented his "calotype" process, in which the negative was obtained by coating the surface of the paper with silver iodide, then washing it over with a mixture of silver nitrate with gallic and acetic acids, after which it was exposed in a camera to the object he wished to copy. The invisible picture thus obtained was developed by silver acetate and gallic acid and fixed with potassium bromide. Minor inventions and improvements followed the introduction of Talbot's process, among which the most important was the use of albumen, recommended by Niepce de Saint-Victor as a film containing haloid salts which he flowed upon the surface of the glass.

The development of the modern rapid processes of photography may be said to have begun with the introduction of the dry collodion process by Scott Archer in 1851. This process consists in coating glass plates with a film of collodion containing soluble iodides or bromides, which form a sensitive silver compound when dipped in a solution of silver nitrate. The soluble collodion is prepared by the action upon cotton of a mixture of nitric and sulphuric acids with a little water, or of a mixture of potassium nitrate with sulphuric acid, the resulting substance being dissolved in a mixture of alcohol and ether. On evaporation the viscous solution leaves a film of collodion. The exact proportions of the ingredients used must be varied at different seasons of the year and must be suited to the character of the objects to be photographed—one variety being suitable for landscape views, another for portraiture, etc. The collodion is flowed over the glass plate, which must be perfectly clean, and when partially dry sensitized by dipping into a bath containing silver nitrate in the proportion of from 35 to 50 grains of the salt to an ounce of water. A very small quantity of potassium iodide is added to the bath. The sensitized plate is then exposed in the camera to the object to be taken. The action of the light on the sensitive silver salts changes them in such a way as to produce a latent image on the film, which is then developed by pouring over the plate a solution of ferrous sulphate or pyrogallol acid, to either of which are added some alcohol and acetic acid, after which the image on the plate is made permanent or fixed by immersion in a solution of sodium hyposulphite, potassium cyanide, or some other liquid capable of dissolving the portion of the silver salts that has not been acted upon by

the light. For the protection of the collodion film it is common to coat the negative with a clear and hard varnish.

As the wet process required that the plates be prepared at the time of exposure, that process naturally found its most extensive employment for indoor work, and continual efforts were made to devise portable plates. Finally plates were introduced which were sensitized, washed, dipped in some organic preservative, such as a solution of tannin, and then dried.

In 1871 Maddox introduced the earliest form of the gelatin-emulsion process, which has since been considerably improved and is now used very largely. In this process the sensitive silver salt is held in suspension in either collodion or gelatin. The collodion emulsion may be made by dissolving in one portion of collodion a solution of zinc bromide, in another a solution of silver nitrate, and then thoroughly mixing the two portions. The gelatin emulsion may be prepared by bringing into solution the gelatin with potassium bromide, while a solution of silver nitrate to which some ammonia is added is gradually poured into the liquefied solution of gelatin. These emulsions are floated on plates and dried. Modern plates of this nature are found to be from 10 to 100 times more sensitive than the older wet plates and have thus made possible the photography of moving objects and of those which are only dimly lighted. They also make possible the flash-light pictures by means of which instantaneous views are taken of a dark interior during the burning of a small quantity of magnesium. A large variety of developing agents are employed with the modern dry plate. Pyrogallol acid in connection with an alkali is perhaps the most common. Sodium hyposulphite is almost entirely used as the fixing agent.

The camera consists of a box, either of wood or a framework of wood with a bellows-expanding body of leather, so that when closed the camera may occupy but little space and be conveniently carried. In the front of the camera is the lens, and at the back a piece of ground glass on which the image of the object to be photographed may be focused, together with an arrangement for lengthening or shortening the body of the camera. The camera should be placed so as to insure perfect rigidity when fixed and for indoor work should be strong and steady, while for outdoor photography the camera stand should be made light so as to be easily portable, or the stand or tripod may be dispensed with altogether.

The lens is of very ancient origin. There is a lens in the British Museum which was found in the ruins of Nineveh, and during the Middle Ages the manufacture and properties of simple lenses were well understood in Europe. In general use now, four varieties of lenses are common: (1) a single lens, consisting usually of a combination of two converging meniscus lenses separated by a diverging meniscus, arranged as a combination in the tube of the lens at the end nearest the camera, the convex side of the combination being towards the plate; (2) a rapid rectilinear lens, consisting of a converging meniscus lens cemented to a diverging meniscus, the latter occupying the outside position in the tube; (3) a wide-angle rectilinear lens, of somewhat similar construction, having two combinations formed of meniscus lenses, but of much deeper curvature than those employed in

other combinations and placed closer together in the lens tube; and (4) the portrait lens, consisting of a back and front combination, arranged at some little distance apart, the front combination containing a double convex and a plano-convex lens cemented together, the double convex lens taking the position next the object, while the back combination consists of a double convex and a diverging meniscus lens, which are frequently mounted so as to leave a small space between the two.

In photographing an object the camera is set up, and, after the image is properly focused on the ground-glass plate, the holder containing the sensitized plates, which are carried in double-backed dark frames arranged to carry two plates, each back to back, is inserted in the camera and the cover of the slide is withdrawn, exposing the sensitized plate so that it receives the picture. The shutter is then closed, and the cover of the dark slide placed over the plate, which is later taken to the dark room for development.

For the bringing out or developing, as it is called, of the latent image that has been produced on the sensitive plate, it is treated with various solutions; thus, in the daguerreotype the vapor of mercury is the agent used, and in the wet collodion process, as has already been mentioned, the development is effected by ferrous sulphate or pyrogalllic acid. In the case of the dry plates a developer, prepared by adding one part of a saturated solution of ferrous sulphate to four parts of a saturated solution of potassium oxalate, to which has been added a very small quantity of a solution of potassium bromide, is sometimes employed. A ferrous citro-oxalate is frequently used instead. As the plates are exceedingly sensitive, they must be developed in a dull ruby light, and the operation is accomplished by laying the plate in the developing tray, face upward, after which the liquid is run gently from one end of the plate to the other. Excellent results have also been obtained by the use of hydroquinone, eikonogen, metol, etc. These substances, when mixed with potassium bromide and sodium sulphite to act as reducing agents, produce very clear negatives. But pyrogalllic acid is still most largely used as a developing agent.

For the reproduction of printed copies from the negative, a paper sensitized by dipping in a solution of silver nitrate is employed and is then exposed to the sunlight, under the negative. The paper, which should be of some light and moderately strong quality, is first coated on the surface with a smooth layer of albumen to which either ammonium or sodium chloride has been added, and then floated in a solution of silver nitrate of varying strength, according to the condition of the negative, and of which 50 grains of the salt for every ounce of water is an average proportion. The exposure to light also varies according to the brightness of the light and the character of the negative. The print thus obtained is toned by immersion in a neutral solution of gold containing certain metallic salts, and finally the image is fixed by immersing the print in a solution of sodium hyposulphite which removes the unaffected silver salt. The final operation consists in thoroughly washing the print, after which it is ready for mounting.

The gradual disappearance or fading out of prints made with silver salts led to numerous attempts to find satisfactory substitutes, and

various metallic salts have been employed for the purpose of producing permanent prints, some of which are described in the following paragraphs.

Cyanotype, or Blue Prints. The earliest of these is perhaps the one first described by Sir John Herschel and consisting in the reduction of ferric salts by light. Solutions of one part each of ammonium ferric citrate and potassium ferricyanide in eight parts of water are made separately and then mixed in a dark room. The paper or cloth is floated on this solution and exposed under a negative to the action of sunlight and then thoroughly washed. This process is employed largely for copying plans by builders and architects, and the lines of the drawing appear white on a blue ground. It is much used on account of its cheapness and simplicity. A somewhat similar process, in which the ammonium ferric citrate is substituted by a solution of one part of uranium sulphate in four parts of water, yields a beautiful rich brown print.

Ferrotypes, or Tintypes. In this process a piece of sheet iron is japanned with black varnish and baked, after which it is sensitized with a collodion solution and exposed in a camera to the object, then developed and finally covered with some protective coating. See FERROTYPES.

Platinotype. The substitution of platinum for silver, originally introduced by W. Willis, has found considerable favor, owing to the fact that the prints are both richer and more permanent than those made with silver salts. The original process consisted in sensitizing the paper with a mixture of ferric oxalate and a platinum salt. Exposure to light resulted in the reduction of the ferric salt to the ferrous state, and when the ferrous salt was in solution the platinous salt was reduced by it. By floating the exposed paper on a solution of neutral potassium oxalate, which is a solvent for ferrous oxalate, the platinum salt in contact was immediately reduced to the metallic state and the image built up. Such prints were fixed by immersion in dilute hydrochloric acid, which dissolved any ferric oxalate or calcium oxalate that might be present. A second process has been introduced in which the paper is simply coated with ferric oxalate containing a small quantity of mercuric chloride, which after exposure is developed by a solution of potassium oxalate with the platinum salt. A still more recent method is one in which the paper is sensitized with a mixture of the platinum salt with sodium-ferric oxalate and sodium oxalate, and under the influence of light and the moisture of the air the reduction of the platinum salt takes place in the printing frame. Excellent results have been obtained by toning silver prints with platinum, which yields rich brown and black tones.

Photomechanical Processes. Methods by which photographic impressions could be reproduced by mechanical means and so used directly on the printing press have naturally been sought for and have been invented. Such processes depend for the most part upon the action of light on a gelatin film impregnated with a bichromate, generally of potassium or ammonium. The processes in question may be divided into two groups. In processes of the first group the picture is molded in gelatin and colored by a pigment. The group includes the woodburytype or photoglyph and the stannotype. In the woodburytype a sheet of bichromatized gelatin, a

highly sensitized mixture of gelatin and potassium bichromate, is prepared and a thin film exposed under a negative to a strong light and then washed to remove the unchanged gelatin that was protected from the light by the negative and finally dried. This film is placed upon a sheet of soft metal, usually lead, and forced into it by hydraulic pressure, producing a mold of the picture, in which the dark parts are in intaglio and the light ones in relief. This mold is then inked with a solution of warm gelatin colored with pigment and a sheet of paper laid upon it, a strong pressure exerted in a horizontal press, the excess of ink being forced out by pressure. The print is then immersed in a solution of alum, which renders the picture insoluble. The stannotype, which is a modification of the foregoing process, consists in substituting for the lead plate a thin sheet of tin foil properly strengthened in the back by electrotyping material. In the photomechanical processes of the second group the picture is printed with ordinary printing ink from a gelatin surface, from stone, from metallic-relief surface, or from an intaglio copper plate. The collotype or phototype processes of this group, in which the picture is printed from a gelatin surface, are represented by the albertype, invented by Joseph Albert, of Munich, in 1869. This process consists of coating a sheet of plate glass with a thin film of chromatinized albumen and gelatin, which is then laid face down on black cloth and exposed to light. The insoluble gelatin next to the plate adheres firmly to the glass and serves as a foundation for a second film, which consists of chromatinized gelatin. The dry film is placed under the negative in a printing frame and exposed to the light until the shades of the image are visible through the glass. Next the plate is washed in water to remove the soluble bichromate and the film hardened with chrome alum and dried. The plate is fastened to the bed of a printing press by means of plaster of paris. The artotype, which is similar to the foregoing, was invented in 1878. A mixture of albumen and soluble glass is used for the foundation, on which the sensitive film is afterward placed. As such a film does not require to be hardened by light, opaque metallic plates may be used instead of a glass plate, as in the previous process. Indotints or autoglyphs are produced by processes similar to the foregoing, except that the support for the gelatin film is usually of copper slightly roughened in order to cause the sensitive film to adhere firmly. The addition of alcohol to the chromatinized gelatin is said to increase the toughness and tenacity of the film. After exposure under the negative the unchanged bichromate is washed out and the plate is dried. Prints from such plates can then be taken on a power press. The heliotype process differs from the foregoing by the hardening of the gelatin film with chrome alum and the detaching of it from the support upon which it was first prepared; thus yielding, when completed, a thin sheet or skin of gelatin that is both tough and flexible, and which may be placed on a plate of zinc or attached to a cylinder when used for printing.

Excellent results in color have been obtained in the foregoing processes by preparing several gelatin plates, each of which corresponds to a different color in the original, and these are then used for printing with colored inks. Prints have been produced in which as many as seven

successive distinct colors have been used. In those processes in which the picture is printed from stone a sensitive mixture of albumen and ammonium bichromate in water is passed over a lithographic stone which has been thoroughly polished and cleaned. The excess is carefully rubbed off and the surface of the stone dried so as to remove all traces of moisture. It is then exposed under a negative, and wherever the light penetrates to the chromatinized albumen it becomes insoluble. After sufficient exposure the surface of the stone is covered with lithographic ink and washed with water so as to remove the soluble parts of the film and then treated with the acid and gummed and printed as in ordinary lithography. The difficulty in handling the heavy stones soon led to the invention of an improved process, in which a sheet of paper, sensitized with a solution of albumen, gelatin, and potassium bichromate, is placed face down on a sheet of smooth copper and then exposed under a negative, after which it was coated uniformly with the usual lithographic transfer ink. The paper is then floated on boiling water in order to coagulate the albumen on the film, and the unaltered gelatin which is protected by the opaque portions of the negative absorbs moisture and swells, leaving the unaltered gelatin depressed. This print, again washed and then dried, is transferred to stone by simply placing it upon that material face downward and passing it through the press.

Processes in which the picture is printed from a metallic relief surface include the ordinary photo-engravings or photo-electrotypes. In the former a plaster mold is taken of the gelatin film and a cast reproduced in type metal, when it is called a photo-engraving, or in copper, when it is known as a photo-electrotype. These include those processes of photo-etching in which the pictures are printed from zinc plates to which the design has been transferred in adhesive transfer ink from paper, similar to the transfer process referred to under LITHOGRAPHY, *Photolithography*. The zinc plate thus obtained is then treated with acid in order to lower the white portions, producing a low relief. See PHOTO-ENGRAVING.

Processes in which the picture is printed from an intaglio copper plate had their origin in France and were known variously as photogravures, photo-aquatints, etc. These consist of gelatin relief films similar to those of the woodburytype (see above), with certain modifications which caused the production of a grain in the relief film; thus, in the case of the photogravures of Goupil, the material producing this effect is said to be pulverized glass. A mold is then made from the gelatin relief, from which a copper plate is obtained by electrotyping, from which the prints are then carefully made.

The invention of a transparent and flexible film pellicle for supporting the sensitized photographic surface was made by Hannibal Goodwin, and his application for patent was filed May 2, 1887, but the patent was not issued until Sept. 13, 1898. The substance itself was entirely new, and the manufactured article consisted of a film support of a dried and hardened cellulosoidal solution of nitrocellulose. The film must be nongreasy, insoluble in developing fluids, insensible to heat and moisture, hard, smooth, brilliant of surface, exceedingly thin and light, and absolutely transparent. It was no easy matter to obtain all these properties in the new support,

and it is only after many years that the film has succeeded in supplanting to any great extent glass as a supporting substance. It was a very important invention and has made possible the widespread modern employment of photography by amateurs. The patent rights of the inventor were contested, and it was only after an extended patent litigation in the courts that the invention of Dr. Goodwin was finally upheld by the decision of Judge Hazel in the First District Court at Buffalo. The case was then carried to the Circuit Court of Appeals, and that court rendered its decision March 10, 1914, confirming the decree of the lower court. So was concluded the important litigation over this patent which had extended over a decade of years. The roll holder, by means of which a long strip of film can be carried in a comparatively small space, was first suggested by W. J. Stillman and has led to the modern hand camera for films, and later to the so-called system of daylight photography, which still further increased and simplified the use of photography by amateurs.

Applications of Photography. In addition to the production of pictures of persons and scenery photography finds extensive application in reproducing paintings and thus popularizing famous works of art. Photography is further employed in many branches of science. The microphotographs of minute forms of life have added much to our knowledge of such organisms, and the photographs of the heavens are furnishing innumerable data that will doubtless lead to astronomical generalizations of the greatest importance. (See **ASTROPHOTOGRAPHY**) The application of photography in legal matters for the purpose of showing forged signatures and establishing facts that were disputed has been of the utmost value. Photographs taken from balloons during the Boer War furnished information that proved of great value, and during the War of the Nations many air craft were equipped with photographic apparatus. The biographic pictures in which the effect of motion is reproduced in consequence of the successive exposure, occupying out a 250th part of a second, have brought about a revision of the opinion in regard to many forms of motion, the details of which can now be studied. And the employment of photography is constantly growing. The applications of modern instantaneous photography to the wide field of moving-picture shows is perhaps the largest and most popular. Photographic material has become an important item in international trade. The value of imports into and exports from the United States alone, including cameras and other apparatus, films and other sensitized goods, having been over \$12,000,000 in 1914. The United States is the world's largest manufacturer of motion picture films: the exports in 1914 amounted to 188,049,654 feet, of which 32,690,144 feet had been exposed, and 155,359,550 was unexposed and intended for use in photographic work in other parts of the world. The value of the motion picture films exported in 1914 was \$6,547,646. See **MOVING PICTURES**; **ROTOGRAVURE**.

Photography in Law. The courts have generally recognized that an accurate likeness of an object or place can be reproduced by means of the art of photography, and photographs are now often an efficient means of demonstrating a fact in the trial of a cause. They are admitted in both civil and criminal cases as an aid to the jurors in their efforts to understand descriptions

of places and objects which might not otherwise be presented in an intelligible manner.

By the general weight of authority a photographer has no right to print copies from a negative likeness of a person, for his own use or distribution in any way, without the person's consent. The person whose likeness is thus taken may restrain the sale of his photographs and recover such damages as he may have sustained by reason of the sale of the copies. This is generally placed on the ground of implied contract and sometimes of breach of confidence. The photographer owns the negative, but the person whose likeness is on it has the right to say whether it shall be used or not for public or advertising purposes.

Bibliography. The literature of photography is so extensive that mention can be made of but few of the many works dealing with the subject in its different aspects. In fact, many of the authorities have prepared a number of works each of which discusses a single process or phase of the subject, and these should be consulted by the reader in search of information. The works of Abney, Robinson, Vogel, Eder, and Burton are all authoritative and valuable. The following works will doubtless be of service to the reader, although it must be understood that such a list is by no means comprehensive: General: Alfred Brothers, *Manual of Photography* (2d ed., Philadelphia, 1899); W. de W. Abney, *Treatise on Photography* (11th ed., ib., 1901); Walter Kilbey, *Hand Camera Photography* (New York, 1903); L. W. Brownell, *Photography for the Sportsman Naturalist* (ib., 1904); C. H. Hewitt, *Professional Photography* (2 vols., ib., 1904); Chapman Jones, *Science and Practice of Photography* (ib., 1905); W. de W. Abney, *Instruction in Photography* (11th ed., Philadelphia, 1905); Louis Derr, *Photography for Students of Physics and Chemistry* (New York, 1906); Beck and Andrews, *Photographic Lenses* (New York, 1908); Charles Holme (ed.), *Colour Photography* (ib., 1908); W. I. L. Adams, *Photographing in Old England* (ib., 1910); id., *Sunlight and Shadow* (ib., 1912); Alfred Watkins, *Photography: Its Principles and Application* (ib., 1911); E. O. Hoppé and others, *Photography* (ib., 1911); H. C. Jones, *Photography of To-Day* (Philadelphia, 1912); G. W. Hance, *Commercial Photography of To-Day* (Cleveland, 1914). PHOTOLITHOGRAPHY. See LITHOGRAPHY, *Photolithography*.

PHOTOMETRY (from Gk. *phōs*, *phōs*, light, + *-metra*, *-metria*, measurement, from *μέτρον*, *metron*, measure). The science of comparing the intensities of sources of light. It has not been possible up to the present time to measure the intensity of a source of light in terms of any absolute standard, i.e., in terms of watts, and therefore it is customary to compare the intensity with that of a standard source of light, and for this purpose various standards of white light have been proposed and used, but none have been completely satisfactory. These will be found discussed below. Experiments are now in progress, however, which may reduce photometry to an exact science. The intensity of any source of light is defined to be the amount of light emitted through a cone whose solid angle is unity; its numerical value is given in terms of *candles* or other standards. (See below.) The *flux of light* is the amount of light emitted through a solid angle of any size; its unit is called a *lumen*. The illumination of any illuminated surface is the flux of light falling upon it divided by its area; its unit is the *lux*, i.e., this is the illumination of a plane surface at a distance of 1 meter from a standard candle when the light falls perpendicularly upon the surface. The *brightness* of a source of light, if it is a surface, is the intensity divided by the area of the surface. Consult an article by Crew, *Astrophysical Journal*, vol. vii, p. 298 (1898).

If a surface is illuminated by a small source of light, its illumination varies directly as the intensity of the source and inversely as the square of its distance from the surface. (See LIGHT.) The intensities of two sources may be compared, therefore, by allowing two portions of the same surface to be illuminated by them. If the illumination over these two portions is the same apparently to the eye, the intensities of the two sources are in the same ratio as the squares of their distances from the surface. Several devices have been invented to secure the illumination of two portions of the same surface by the two sources. These instruments are known as photometers and are described below. The problem of comparing two colored sources of light, or of comparing the intensities of the colors produced by two sources

of white light when dispersed by a prism, is virtually the same as that just discussed, but it requires a photometer adapted for this purpose. See SPECTROPHOTOMETRY.

Photometers. Most photometers are based on the law of the inverse squares and enable us to compare the relative intensities of two lights by finding at what distance they furnish equal illumination. There are also other photometers, but those depending on the equality of illumina-

Fig. 1.

tion are by far the most extensively employed. The earliest photometer was devised by Bouguer and consisted of a vertical screen at right angles to a partition. On either side of the partition was placed a light so that it would illuminate one side of the screen. These lights were then adjusted until the two halves of the screen appeared of equal brightness. The distances of the lamps or lights from the screen were measured, and a proportion was formed according to the law of the inverse squares. The screen, which was at first opaque, in later instruments was supplanted by one of ground glass, oiled paper, or other translucent material. An instrument based on the same principle, which is in some respects modified, is shown in the accompanying diagram (Fig. 2). Here A and B are the two illuminants, as before, and the rays of

Fig. 2.

light fall on the surfaces of the prism C. The two lights are moved so that the surfaces of the prism appear equally illuminated to the eye of the observer at E. A simple and effective photometer was devised by Lambert in 1760; but as it was used extensively by Rumford some years later, it is known by his name. It consists of a vertical screen with a white surface, in front of which stands a cylindrical stick. The lights

FIG. 3. RUMFORD PHOTOMETER.

to be compared are placed in front of this stick, so that each will cast a shadow on the screen. These shadows represent the amount of light furnished by but one of the sources; consequently, by varying the distances of the lights from the screen, a position can be obtained

where they furnish shadows of equal intensity. Measuring the distance of the lights from the screen, squaring these numbers, and forming a proportion, we can again compare the intensity of the two illuminants. A second screen with an aperture cut in it may be placed parallel to the first with the lights in front of it and some little distance apart, so that each illuminates the screen by means of rays sent through the aperture. The two separate spots of light on the screen can be made equal by adjusting the lights and their comparative intensity computed as before. The photometer in most general use is that of Bunsen, where the two lights to be compared, *A* and *B*, are placed at the opposite ends of the apparatus and a screen, *C*, whose face is perpendicular to the incident rays can be moved to and fro between them. This screen is made of a sheet of white paper, with a central spot,

FIG. 4. BUNSEN PHOTOMETER.

d, produced by oil or grease, which appears bright on a dark ground by transmitted light and dark on a light ground by reflected light. When the transmitted and reflected lights are equal in intensity, the spot should disappear and the surface of the paper appear uniform, but in actual practice this condition is not realized. The usual form employed is a modification known as the Leeson disk, where accurately matched ring or star-shaped apertures of opaque paper are pasted on the opposite sides of a sheet of translucent paper. The disk should be available either for equality of brightness or equality of contrast. The paper screen is usually mounted in a box or carriage with mirrors or prisms enabling the observer to see simultaneously both sides of the paper and is moved along a scale between the two lights, which is either graduated in units of length or indicates candle power direct. The reading is taken when the spot disappears as nearly as possible, and the candle power or relative intensity is determined as in the other cases. The arrangement of the lights, of course, varies in different forms of the instrument, as does also the construction of the box carrying the screen, but in general the results do not possess a greater accuracy than 4 or 5 per cent. The Rumford photometer cannot be depended upon closer than 8 or 10 per cent, but in all classes of photometric work much depends on the observer.

The most modern and accurate photometer for use with two light sources of the same color is that of Lummer and Brodhun, in which the central spot disappears entirely when the lights are of equal intensity. This is accomplished by the use of two right-angled prisms—one, *E*, with its hypotenusal face plane, the other, *F*, with this face ground spherical except in the centre, where a circular spot is perfectly plane. The two prisms are then placed with their hypotenusal sides adjacent, but separated except at the centre, where the plane ground surface of the second prism is in contact with that of the other. The lights are placed at opposite ends of the apparatus, as in the case of the Bunsen photometer, and the rays fall on a central opaque screen, *C*, from which they are reflected to mirrors, *D* and *D'*, and then to the faces of the prism. The rays

from *B* entering the prism *F*, which has a spherical surface, undergo total reflection, except at the central portion, *d*, where the glasses are in contact. Therefore, only the rays passing

FIG. 5. PLAN OF LUMMER-BRODHUN PHOTOMETER.

through this central portion enter the second prism, *E*, and produce a spot of light of elliptical shape on its opposite surface. The rays from the other source of light, *A*, are reflected into the prism *E* and by total reflection at the hypotenuse are brought to the third face of the prism, except those falling on the surface of contact, which enter the prism *F*. Consequently we have the surface of the prism *E* nearest the observer illuminated in part by the rays from one source of light and in part by rays from the other. If the illuminant to the left of the observer, e.g., is of greater intensity, then we have a bright spot on a dark ground and reversing the conditions the dark spot surrounded by light. When the lights are of equal intensity, the spot entirely disappears and the field is uniform. The Lummer-Brodhun screen is usually

FIG. 6. LUMMER-BRODHUN PHOTOMETER.

mounted on a carriage which can be moved along a scale and which is easily reversed as a check on the observations. It has also a telescope, *H*, to observe the surface of the prism, which is a distinct advantage, as it permits the use of one eye and enables the observer to decide more accurately when the spot disappears, though the Bunsen and Leeson types, being binocular, are less fatiguing for a number of observations, though less sensitive.

Another photometer which has within recent years come into general use is called the *flicker photometer*; and it has the great advantage of permitting a comparison of two light sources of different colors. It was devised by O. N. Rood in 1893 and since then has been greatly improved by Whitman and others. If a surface is illuminated first by one source and then by another, at very close intervals of time, it will appear to the eye to be uniformly illuminated if the two sources produce equal illumination; whereas, if they do not, there will be a flicker. Rood showed that this fact is independent of the colors of the two sources. In practice there are two adjacent

surfaces—one illuminated by one light source, the other by the second source; this double surface is viewed through a prism, so that for one position one of the two surfaces is seen and for another position of the prism the other surface. Then the prism is made to move rapidly, so that the eye sees the two surfaces in rapid succession. One of the light sources is then moved away from or towards its illuminated surface until there is no flicker. There are certain conditions for the accurate use of the instrument, but these are not difficult to secure.

There are various portable photometers, modified from the various standard forms. Of these the Weber, making use of a small calibrated standard incandescent electric lamp and a Lum-

mer-Brodhun prism device, is used in Europe, but it did not appeal to scientific men universally as an accurate standard. Candles have been used for a number of years as standards in spite of their many shortcomings, and we are now accustomed to have our electric and other lights rated in candle power. The candle in use in the United States and England for photometric tests is the standard spermaceti candle, which burns 120 grains of material per hour and six of which weigh one pound. When this is prepared according to certain specifications as to size and form of wick and burns with a flame 45 millimeters in height, the light emitted is considered unity; but experience has proved that it is not possible to make candles sufficiently alike for scientific purposes. The stearin star

FIG. 7. LUMMER-BRODHUN PHOTOMETER ARRANGED FOR TESTING INCANDESCENT ELECTRIC LAMPS

mer-Brodhun prism device, is used in Europe and in the Sharp-Millar and Macbeth photometer in the United States, where the more precise instruments are known as illuminometers. It has a range from 0.004-foot candles to 2000-foot candles.

Brief mention should be made also of integrating photometers where the mean spherical or mean hemispherical intensity can be measured. In other words, such an instrument enables an observer to determine at a single observation the total flux of light from a source of illumination. Such photometers are maintained at the United States Bureau of Standards and at some of the more important testing laboratories.

Standards of Light. The question of standards of light possesses an intimate and important connection with photometry and is a subject which is still attracting much attention from physicists. Until the International Congress on Electrical Units in 1883 adopted as the absolute standard the amount of light emitted by a square centimeter of melted platinum at the point of solidification, there was no really scientific unit in general use. This is known as the Violle standard and it has not proved to be sufficiently reproducible for exact work. Numerous forms of candles and lamps were employed, but little reliability could be placed on the results obtained in such tests, and they did not form a satisfactory basis for subsequent or independent determinations. In France the standard used in photometric tests was the Carcel lamp, which burned purified rapeseed oil. The lamp was constructed according to certain fixed specifications,

candle was used in France and a somewhat similar candle in Germany, while a paraffin candle known as the Vereinskerze on account of its being adopted by the Union of German Gas Men was used in Germany and Austria-Hungary. The standard now commonly used in Germany is the acetate of amyl lamp of Hefner. In 1909 there was an international agreement by which the pentane lamp of England, the decimal candle of France, and the American candle were adjusted to be equal, and each to be equivalent to 1.11 Hefner candles of Germany. In practical photometry secondary standards consisting of incandescent lamps which have been standardized by comparison with some fundamental standard are used, and ordinary lamps are tested by reference to them. Two other types of standards have been proposed within the past few years, and they are in many respects a great improvement on the earlier ones. Nutting, Steinmetz, Ives, and others have advocated the adoption of the light from a vacuum tube through which an electrical discharge is passing; this light is, of course, discontinuous, consisting of a number of isolated colors. This is a disadvantage, but not a fatal one. In 1908 Waidner and Burgess, of the National Bureau of Standards, proposed the adoption as a standard (either of white or of monochromatic light) the intensity of the light emitted by 1 square centimeter of a black body at the temperature of the solidification of platinum (this is approximately equivalent to 88 Hefners). This standard is by far the best proposed. See **ASTROPHYSICS; ILLUMINATION; LIGHT.**

PHOTOMICROGRAPHY. See MICROPHOTOGRAPHY.

PHOTOPHONE (from Gk. *phōs*, *phōs*, light + *phōnē*, *phōnē*, voice), or **RADIOPHONE**. The invention of the photophone arose from the employment by Willoughby Smith of selenium (q.v.) as a resistance medium in testing submarine cables in 1873. It was found that the electrical resistance of selenium varied considerably under the influence of light. Werner Siemens (in 1875) produced some extremely sensitive varieties of selenium, and in some of his experiments the resistance on exposure to light was found to be only one-fifteenth of what it was in the dark. Prof. Alexander Graham Bell (q.v.) substituted the telephone for the galvanometer and used intermittent flashes of light to produce a succession of changes in the conductivity of the selenium, corresponding in frequency to the musical vibrations within the limits of hearing. He perceived that the effect could be produced at the extreme distance at which selenium would respond to the action of a luminous body, and that this distance could be indefinitely increased by the use of a parallel beam of light, so that it would be possible to telephone from one place to another without a conducting wire. A form of photophone was devised in which light reflected from a plain mirror or flexible material, such as silvered mica or a microscope-cover glass, against the back of which the speaker's voice is directed, was caused to vibrate with a frequency corresponding to that of the diaphragm itself. A large beam of sunlight or any other powerful light is concentrated by means of a lens upon the diaphragm mirror, which after reflection is again rendered parallel by means of another lens. The beam is received at a distant station upon a parabolic reflector, in the focus of which is placed a sensitive selenium cell, connected in a local circuit with a battery and a telephone. This method of communication was first demonstrated by Bell and Tainter in 1880 at Washington over a distance of 213 meters. At Chicago in 1893 at the Exposition Bell exhibited an arrangement where for a receiver he employed a thermophone or small blackened sphere on which the interrupted rays fell. In later experiments by Ruhmer and others use was made of selenium cells in connection with a so-called speaking arc, and sound was transmitted over 9 miles.

Subsequent experiments by Professor Bell with

an interrupted beam of light and different fibrous and porous materials, such as cotton wool, worsted, silks, sponge, lampblack, etc., indicated that lampblack may be substituted for selenium in an electrical receiver. In France M. Mercadier passed an intermittent beam from an electric lamp through a prism and found a difference in the audible effects in different parts of the spectrum. These experiments were repeated by Professor Bell, who ascertained that sounds were obtained in every part of the visible spectrum excepting the extreme half of the violet, as well as in the ultra-red. Professor Bell constructed an instrument for use in spectrum analysis, which he termed a spectrophone. The eyepiece of a spectroscope was removed, and sensitive substances were placed in the focal point of the instrument behind an opaque diaphragm containing a slit. These substances were put in communication with the ear by means of a hearing tube, and if the interior of the spectrophonic receiver is smoked and the cavity filled with peroxide of nitrogen gas, we have then a combination that gives us good sounds in all parts of the spectrum, visible and invisible, except the ultra-violet. A rapidly interrupted beam of light is passed through some substance whose absorption spectrum is to be investigated, and bands of sound and silence are observed upon exploring the spectrum, the silent positions corresponding to the absorption bands. The method was not intended to supplant ordinary methods of spectrum analysis, but Professor Bell thought that in the invisible part beyond the red the method might be applicable. Consult A. G. Bell, *The Photophone* (Washington, 1878), and Ernst Ruhmer, *Drakhtlose Telephonie* (Berlin, 1907). See SELENIUM; WIRELESS TELEPHONY.

PHOTOPLAY. See MOVING-PICTURE PLAY; MOVING PICTURES.

PHOTOSCULPTURE. An ingenious use of photography to assist a sculptor in modeling portrait statues or facsimiles and reduced reproductions of other statues. This is accomplished by taking a number of photographs from different points of view and transferring the outline of these by means of a pantograph to the marble or clay. The device was invented in 1861 by Villème in Paris and has since been improved in Germany and by Carlo Base in Florence; but it has been replaced in later years by the pointing machine. See SCULPTURE.

PHOTOSPHERE (Gk. *phōs*, *phōs*, light + *sphaîra*, *sphaîra*, sphere). The visible surface of the sun, and the source of most of the light and heat radiated by that body. The spectroscopic shows that it is composed of highly incandescent vapors which float on the less luminous gases forming the body of the sun. When examined through the telescope, the photosphere presents a mottled appearance, due to the presence of bright spots which are differentiated into nodules and faculæ. The latter are usually found near sun spots, and are merely portions of the photosphere raised above the general level of the surface so that their brilliance is less dimmed by the absorption of the gases in the solar atmosphere.

PHOTOSTAT. A trade name for a special photographic camera with self-contained developing and fixing arrangements, designed for the direct and rapid photographing of printed or written documents, maps, drawings, records, etc., directly on the surface of a specially sensitized

paper without a reversal of the image, and producing a clear record in white on a black ground. It consists of a camera with bellows extension for focusing, a special copying lens, a total-reflection prism for correcting the image so that it will not be reversed as in an ordinary negative, a light-tight magazine for carrying a roll of the sensitized paper, devices for rolling and cutting off the prints as they are exposed, developing pan and slide to develop the print as it is cut off, and a fixing tray for finishing the exposed and developed print. The instrument is self-contained and can be readily operated, so that it is particularly serviceable in a large establishment or a library, where documents must be copied with accuracy. Thus, certain insurance companies make photostatic copies of their original policies for record, and maps and plans can be reproduced at any scale desired.

PHOTOSYNTAX (from Gk. *phōs*, *phōs*, light + *suntaxis*, *synthesis*, arrangement). The first special term proposed (1893) to designate the process of the manufacture of carbohydrate food by green leaves under the influence of light. See PHOTOSYNTHESIS.

PHOTOSYNTHESIS (Neo-Lat., from Gk. *phōs*, *phōs*, light + *sunthesis*, *synthesis*, combination). The process by which the green parts of plants construct carbohydrates under the influence of light. Carbohydrates are substances like sugars, starch, etc., which serve as the most important foods, both for plants and animals. The process may be conveniently treated under the following heads: (a) raw materials; (b) machinery; (c) energy; (d) products; (e) effect of external conditions; (f) cosmic significance.

(a) The raw materials for the process are carbon dioxide and water. Since the carbon dioxide and water unite when the former goes into solution in the latter ($H_2O + CO_2 = H_2CO_3$), they are furnished to the chloroplast as carbonic acid. The entrance of the carbon dioxide into the plant, as such, or in the form of carbonic acid, is in strict obedience to the laws of diffusion, the movement being towards the regions of consumption or lowest concentration. In submerged water plants the carbonic acid is taken from the bathing water. In land plants the carbon dioxide is obtained almost exclusively from the air, and the water from the soil. In these plants the amount of water used in photosynthesis is almost negligible as compared with the loss by transpiration. Land plants lacking stomata and highly cutinized surface walls absorb carbon dioxide on the entire air-exposed surface, while those with stomata take in the carbon dioxide almost exclusively through them. In the latter case the carbon dioxide diffuses as a gas through the stomata and intercellular spaces. It goes into solution on the moist surfaces of the walls facing these spaces, and from here diffuses as carbonic acid to the chloroplasts. The total stomatal openings do not usually equal 1 per cent of the total leaf surface, and are frequently very much less than this, while the partial atmospheric pressure of carbon dioxide is very low, averaging about 0.03 per cent of the total atmospheric pressure. It long puzzled plant physiologists to explain how enough carbon dioxide to account for the very considerable fixation occurring in the plant could be taken up through this small total opening from such a dilute atmosphere. This was later cleared up by showing that so multiperforate a system as is presented by the cuticle, stomatal system, and aëration sys-

tem of the leaf is about as efficient in gas absorption as if the whole leaf surface were open. The carbon dioxide supply of the air, as determined by fixation on the one hand and release on the other, is a matter of great interest in this connection. It has been estimated that the carbon dioxide supply in the air over each acre is about enough to produce four 100-bushel crops of corn, and that if the land surface of the earth were entirely seeded with vigorous sunflowers, they would consume all the carbon dioxide in the air in 50 months. This shows the necessity for the other phase of the carbon cycle, carbon dioxide release. The two great carbon-dioxide-forming processes are respiration and fermentations of plants and animals and the burning of carbon compounds. The total atmosphere contains approximately 2,500,000 billion kilograms of carbon dioxide. Mankind produces by respiration about 439 billion kilograms a year. The coal burned in the United States in 1907 produced about 727 billion kilograms. These two sources alone produce about 0.0005 of the total content of the atmosphere in one year. The most stable forms of carbon compounds made by plants are cellulose, wood, and suberized or cutinized walls. Fortunately there are many microorganisms in the soil that decompose the first two, and the last two are probably the main source of coal, from which carbon dioxide is being rapidly released by the agency of man.

(b) The chloroplast (q.v.) is the organ for photosynthesis and chlorophyll (q.v.) is the pigment essential for the process. Xanthophyll and carotin (q.v.), which always accompany chlorophyll in the plastid, are evidently not capable of carrying on photosynthesis; if they bear any part in the process it is the protection of chlorophyll against destruction by light. It has been asserted that other pigments, the blue, brown, and red of various algae and the purple of certain bacteria, are effective in photosynthesis, but late work renders this view doubtful. It is not known how chlorophyll makes light effective in decomposing carbonic acid, a capacity it lacks in the absence of this pigment. It has been suggested that it acts as a sensitizer, just as certain aniline dyes render the photographic plate sensitive to the longer rays of the spectrum. It has been suggested also that it acts in a photodynamic manner, as is common for many pigments showing fluorescence. This is shown by the fact that many such pigments are toxic to protoplasm in light but innocuous in darkness.

(c) The source of energy for photosynthesis, which is a reduction and endothermic process, is

FIG. 1. THE ABSORPTION SPECTRUM OF CRUDE CHLOROPHYLL.

The most important absorption bands are the three regions near the B, c, and D lines. The absorption to the right of the F line is faint and not easy to resolve into three bands.

the visible portion of the solar spectrum. Neither the ultra-violet nor the infra-red, representing about 63 per cent of the solar energy, is effective. Of the visible spectrum only the portion of the light that is absorbed by chlorophyll is

available. The accompanying figure shows the absorption bands of an alcohol extract of leaves. Such an extract contains, in addition to chlorophyll, xanthophyll and carotin, which increase somewhat the absorption to the right of the F line; yet this spectrum, on the whole, is very similar to that of pure chlorophyll. Of the rays absorbed not all are equally effective in photosynthesis. Earlier work claims two photosynthetic maxima, the main one in the red near the B line, and another in the blue near the F line. These measurements are not satisfactory, for no account was taken of the amount of energy furnished by different portions of the spectrum. Later measurements, using the red-yellow (620 μ to infra-red), blue violet (509 μ to ultra-violet), and green (512–524 μ), all of equal energy, found the first two equally effective and the last entirely ineffective. In nature, owing to the preponderant energy of the red-yellow, it is of greatest significance in the process. In contrast we have the blue-violet of almost exclusive significance as a growth and movement stimulus in plants. It is asserted that the direct sunlight incident at right angles to the plane of the leaf can be reduced to one-twelfth without showing any mark of reduction in photosynthesis in the ordinary mesophytic leaf. The minimum light intensity necessary for photosynthesis must vary with different plants, but there are many difficulties in the way of determining it accurately. While sunlight is the main source in nature, artificial lights of various kinds are efficient in proportion to their intensity. Horticultural experiments in the United States and England have shown that electric light may be used for forcing certain plants in winter to a more vigorous development of foliage and vegetative organs. See ELECTROCULTURE OF PLANTS.

Scarcely any two cells of the plant receive the same amount of light. Those, therefore, that lie on the upper side and are first reached by the light are in the most favorable position for photosynthesis. As many as possible are developed by leaves in this position. Indeed, the palisade region (see LEAF) depends for its mode of development on the action of light. The internal cells, receiving only that which has passed one or more external layers, work at a slower rate, although they are usually better situated for receiving an adequate supply of carbon dioxide.

(d) Under the products of photosynthesis may be first considered the by-product, oxygen. Since in the process carbohydrates are made from water and carbon dioxide, the reaction may be represented by the empirical formula

According to the formula, there should be the same volume of oxygen produced as of carbon dioxide consumed, and the ratio $\frac{\text{O}_2}{\text{CO}_2}$ should equal

1. As a matter of fact this ratio is usually somewhat greater than 1 (about 1.06), and in succulents it may under certain conditions have a value of 1.28. The high value of this quotient results from other carbon dioxide and oxygen producing and consuming processes going on in the plant simultaneously with photosynthesis. In the first case it probably results from the formation of such reduced substances as fats from carbohydrates, and in succulents from the respiration of oxygen-rich organic acids in the

sunlight. Many attempts have been made to follow the processes and intermediate products involved in the building up of carbohydrates, but our knowledge here is still very unsatisfactory. It seems, however, that it is a very complex process, involving many reactions and intermediate products. Sachs spoke of starch as the first visible product of photosynthesis. We now know that starch forms only after the accumulation of considerable soluble sugar in the most marked starch-depositing forms, such as the pulse and the nightshade families, and that it never forms in natural conditions in certain representatives of the lily family. In the latter forms, however, it can be forced to form by soaking the organs in 20–25 per cent sugar solution. Starch, therefore, is a secondary product of photosynthesis, somewhat as are cellulose, hemicellulose, wood pectin; and it is usually preceded by soluble sugars, glucose or cane sugar. Von Baeyer held that formaldehyde is an early intermediate product in photosynthesis and that this is condensed to sugar. Much evidence, though none of it is conclusive, has accumulated for this view, and it has become customary to think of the process as occurring in two important steps—reduction of carbonic acid to formaldehyde, the endothermic or energy-storage step; and the condensation of formaldehyde to glucose, a slightly exothermic process. Undoubtedly each of these general steps involves several intermediate steps and products. The main evidences that formaldehyde is an intermediate product in the process are (1) it is found in living green tissue and even chlorophyll extract when these are illuminated in the presence of carbon dioxide; (2) though toxic in considerable concentrations, in low concentrations it can be transformed by green living tissue into carbohydrates; and (3) formaldehyde as an intermediate step is the natural course of transformation on the basis of chemical knowledge.

(e) There are a number of factors that jointly control the rate of photosynthesis. Each of these factors varies considerably in significance and in its cardinal points with different ecological plant groups. For the temperate-zone mesophyte the following statements summarize the effects of the main factors, with higher temperatures (25° C.) and higher light intensities the rate of photosynthesis increases as the carbon dioxide concentration of the air rises to several times that of the normal atmosphere. This shows that the carbon dioxide supply limits the rate of the process in nature under good temperature and light conditions. In good illumination and high carbon dioxide supply the rate of the process rises with the temperature from 0° C to 25° C., with a coefficient of about 2.6 for 10° C. rise in temperature. This is similar to the effect of temperature upon the rate of chemical reaction in a test tube, indicating the essential chemical nature of the process. At temperatures higher than 25° C secondary injurious effects of temperature set in. This breaking point for temperature is probably considerably higher in tropical forms and succulents. In favorable temperatures and carbon dioxide supply the rate of the process rises with the light intensity up to that approaching full diffuse daylight. Gorging of the leaf with organic material owing to long-continued photosynthesis reduces the rate of the process.

(f) From the cosmic side photosynthesis has two points of great significance. It is the main

primary source of organic foods for all plants and animals, both as building and as respiratory and fermentative material. It is the source of the great part of the latent energy liberated and used in the physiological processes of the world and in the physical processes carried on by man. These points are well illustrated by the facts that fats, proteins, and all other natural organic materials have their carbon source in carbohydrates and that the energy of coal and wood is that rendered potential by this process. While chemosynthesis is in certain respects coordinate with photosynthesis as a cosmic process, the amount of organic food of this origin is insignificant, and the energy used in chemosynthesis can in large part be traced to that rendered potential by photosynthesis. See ENERGY OF PLANTS.

PHOTOTAXIS (Neo-Lat., from Gk. *phōs*, *phōs*, light + *taxis*, arrangement, from *tassein*, to arrange). 1. In animals, the control by light of the direction of locomotion. Like the unicellular plants, the Protozoa, as well as higher animals, may migrate in a direction determined by that of the rays of light. According as the migration is towards or from the source of light, we can distinguish positive and negative phototaxis. The flagellate Infusoria (*Chilomonas* and *Euglena*) will move towards the light, crowding together on the illuminated side of the vessel. *Amoeba* has been observed by Davenport to be strongly phototactic, showing that such responsiveness is a general property of protoplasm, the result of chemical changes produced by light. Ciliate infusorians are not markedly phototactic. Cells containing kinds of pigment differing so widely as the chlorophyll of plants and the retinal pigment of the eyes of arthropods respond to the action of light in a similar way, this response being adaptive. A striking example of phototaxis in pigmented cells (chromatophores) is described by Keller. He has discovered that the dark color of the (illuminated) skin is owing to the rich branching at the base of the epidermis of black pigment cells lying deep in the cutis. In the dark the pigment granules stream out of the branches into the cell body, but the branches themselves are undisturbed. So long as the black pigment has this central position, the skin appears whitish. The light, on the contrary, causes the pigment, which is probably carried passively in the plasma, to move centrifugally. (See PIGMENT.) *Hydra* was observed by Trembley to wander towards the light, and this is of advantage to the animal, because many of the Entomostraca on which it feeds are also phototactic. So also is the starfish. The phenomenon is especially marked in bilateral animals, such as planarians, annelids, crustaceans, flies, and many other insects, mollusks, and vertebrates. As Davenport states, animals that live in shady places or in the dark are negatively phototactic, i.e., shun the light, while those living in the light are positively phototactic. The house fly is well known to be phototactic, but its maggot shuns the light. Butterflies, says Davenport, are attuned to a high intensity of light, moths to a low intensity, so that bright sunlight, which calls forth the one, causes the other to retreat. On the other hand, a light like that of a candle, so weak as not to stimulate a butterfly, produces a marked response in the moth. The males and females of ants have been observed while mating in the air to be strongly phototactic, but after that period

they show themselves neutral. (Loeb.) The larvæ (nauplii) of barnacles as well as other pelagic animals rise to the surface of the sea during the night, but descend before the strong sunlight. Temperature also affects phototaxis; a low temperature causes several of the normal responses, while under a high temperature it is accelerated; Loeb has found also that a concentrated medium, as when the water is rendered more salt, acts as the lower temperature. While in the retina of the eye the protoplasm is specialized for perceiving light, there is some evidence that in the eyeless animals the whole surface of the body contains such light-perceiving substances. This is well known to be the case with earthworms, and perhaps with the oyster, *Pholas*, *Umo*, etc. The pelecypod *Psammobia*, the blind *Proteus* of caves, and *Triton cristatus* when blinded are irritated by rays of light, especially the blue rays, falling on the skin. Consult Davenport, *Experimental Morphology*, part i (New York, 1897), which contains a full bibliography. Cf. TROPISM.

2. In plants, the sensitiveness to illumination. This may be fundamentally the same as heliotropism (q.v.). The effect of light upon the organism may be to accelerate or to retard the movements of the motor organs on the illuminated side, this causing the body to be rotated until both sides are equally illuminated (see CHEMOTAXIS; CHEMOTROPISM), when any progress will then necessarily be towards or away from the source of light. Organisms that approach the source of light are said to be positively phototactic, those that recede from it negatively so. The same organism may show successively both forms of response in light of different intensity. For instance, *Euglena viridis* is positively phototactic in weak light, but negatively so in strong. See EVOLUTION; HELIOTROPISM.

PHOTOTHERAPY (from Gk. *phōs*, *phōs*, light + *therapeia*, *therapeia*, cure, from *therapeuein*, *therapeuein*, to cure, from *therapōn*, *therapōn*, attendant) Treatment of disease by means of light. The method of applying light for therapeutic purposes, devised by Dr. Niels R. Finsen, of Copenhagen, about 1896, is founded on the following data: (1) the bactericidal property of the chemical rays of light; (2) the power of the chemical rays of light to produce an inflammation of the skin (sunburn, *erythema solare*); (3) the power of the chemical rays of light to penetrate the skin. The violet and ultra-violet rays of light obtained from the sun or from an electric arc lamp will, in a few hours, kill plate cultures of *Bacillus prodigiosus* at a great distance. The so-called sunburn is not a burn. If sunlight or electric light be passed through a layer of distilled water so arranged as to cut out the infrared rays (the dark rays of heat), the resulting skin inflammation is as great as if the light were uncontrolled. If sunlight be thrown on the skin through a glass screen which cuts out the violet and ultra-violet rays, no inflammation is seen. Again, if small sealed bottles containing muriate of silver be placed under the skin of some animals kept in the dark and of some animals exposed to the sun, and the tubes be removed an hour later, it will be found that the muriate of silver is blackened in the cases of the animals that were exposed to the sunlight, but not in the cases of those kept in the dark. It is shown by experiment that the chemical rays of light penetrate more easily in bloodless tissues than in

those filled with blood. In a piece of sensitized paper put against the back of a man's ear on the front of which the blue and violet rays are allowed to fall for five minutes, no reaction takes place. If the paper be replaced and the ear be compressed tightly between two glass plates and exposed again to the same light, the paper will be blackened after 20 seconds' exposure. In the treatment of patients sunlight is used in summer, when the sky is bright, but otherwise the light of electric arc lamps of 50 to 80 amperes is employed. Concentration of the light is necessary to render it powerful as a bactericide. To avoid burning the skin the light must be colored. To make the sunlight strong yet cool Finsen devised a special apparatus consisting of a lens about 20 to 40 centimeters in diameter. The lens, composed of a plain glass and a curved one, is framed in a brass ring, with a bright blue, weak ammoniacal solution of sulphate of copper between them. The water absorbs the infra-red rays and, being blue, it excludes much of the red and yellow rays. The excluded heat rays have little bactericidal power, whereas the blue, violet, and ultra-violet rays are but slightly impaired in chemical or bactericidal power. The lens is so hung that it can be raised and lowered as well as turned on a vertical and horizontal axis, by which means it can be placed perpendicularly to the sun's rays and at such a distance as to make the light strike the diseased area. For concentrating the electric arc light Finsen devised an apparatus consisting of lenses of quartz framed in two brass tubes, telescoping the one within the other. Quartz allows the ultra-violet rays (even those of short wave length) to pass through it more easily than they pass through glass, and these rays from the electric light are of less length than those from sunlight. Facing the lamp are placed two lenses having together a focal distance of 12 centimeters. At this distance from the lamp those lenses will concentrate and render parallel the divergent rays from the lamp and direct them through the brass tubes, at whose distal end they strike two quartz lenses. These lenses concentrate the parallel rays and converge them till they are united about 10 centimeters beyond the outer lens. The space between these latter lenses is filled with distilled water, which absorbs the infra-red rays, but does not impair the blue, violet, and ultra-violet rays. Surrounding this end of the apparatus is a mantle, through which cold water flows to prevent boiling of the distilled water between the lenses. In spite of all this precaution the light is still too warm, and the skin must be cooled to avoid burning. This is effected by an apparatus consisting of a plate of quartz and a plain convex lens of quartz, both fitted into a conical brass ring, which carries two small tubes and four arms. To each arm is fastened an elastic band by means of which the apparatus is pressed against the skin. Cold water is run into one tube and out of the other, and thus the skin is cooled so that it can tolerate the strongest light. The pressure of the plano-convex lens on the skin renders it anæmic, thus fitting it for the easy penetration of the chemical rays. A small area of the skin is treated for an hour each day. The skin swells and becomes red, and a bulla may appear; but sloughing has not resulted. During the application the nurses are obliged to wear dark glasses to protect their eyes from the brilliant light. Dilatation of cutaneous vessels by violet rays may continue for several weeks.

Treatments are given also by means of various lamps that produce pure ultra-violet rays and by those that employ the blue or red frequencies, as well as by those utilizing the entire spectrum. Treatments by the blue rays are given by means of the minim light, which consists of an incandescent lamp of 50 candle power inclosed in an aluminium reflector and covered by a cobalt-blue glass. This makes a portable apparatus and is very effective, but owing to its smallness considerably longer treatments are necessary to accomplish results. The ordinary marine searchlight is used in many cases. The lamp is placed at a distance of from 10 to 20 feet and the beam of light is concentrated on the part to be treated. This beam is used with or without a screen of cobalt-blue glass. The blue glass absorbs the heat frequencies and the patient is able to take longer sittings.

The entire range of the spectrum is used by the leucodescent lamp and the electric-light bath. The leucodescent lamp consists of a group of 50-candle-power incandescent lamps or one 500-candle-power lamp inclosed in a reflector, which focuses the light to a small area but not to a point. If the focus is too small the heat generated is too great to be borne. The lamp is suspended from a frame and is kept moving over the skin at a distance of about 2 feet. The treatment is continued until the surface of the skin is thoroughly reddened and a sensation of warmth is produced in the part of the body exposed. The electric-light bath, instituted by Kellogg in 1894, consists of a large wooden cabinet lined with plate-glass mirrors and containing a number of incandescent lamps, or several arc lights, or a combination of both. The patient disrobes and enters the cabinet, leaving the head extending above the top. The cabinet is then closed and various numbers and combinations of lamps are turned on. A nurse standing near by takes the temperature of the patient to avoid too high a rise in body temperature. This gives a general treatment and is used in constitutional conditions, especially those produced by absorption of toxic materials generated within the body. It is used also in the reduction of excessive accumulation of fat. The electric-light bath is given also by means of boxes containing electric lamps and made to fit around various parts of the body.

The greatest benefit from phototherapy, employing the higher frequencies, has been found in cases of eczema, acne vulgaris, alopecia areata, epithelioma, nevus vasculosus, lupus, tuberculous glands, and local septic processes. The red rays have been used in the treatment of smallpox. The treatment devised by Finsen is to exclude all rays above the red by means of red cloth or very thick glass. Not the slightest ray above the frequency of the red must strike the patient from the first appearance of the eruption until every vesicle is dry. The treatment has resulted in the recovery of patients without scarring. The objection to this treatment is that continual exposure to the red frequencies produces over-excitation, which makes treatments severe on both patient and attendants. Phototherapy is now employed by well-known physicians and sanitariums in the United States and in Europe.

PHOTOTROPISM (from Gk. *phōs*, *phōs*, light + *τροπή*, *trōpē*, a turning, from *τρέπω*, *trepein*, to turn). A sensitiveness of plant organs to light, by virtue of which they bend to assume definite positions with reference to the direction of light incident upon them. See HELIOTROPISM; TROPISM.

PHRANTZA, frānt'zā, or **PHRANTZES**, frānt'zās (Gk. *Φραντζή*, *Phrantzē*), GEORGE (1401-c.78). A Byzantine historian, born at Constantinople. He was secretary to the Emperor, Manuel II, and held other high offices, finally that of chancellor. At the fall of Constantinople (1453) he was captured, but managed to escape to the court of Thomas Palæologus. When Achæa also was captured by the Turks (1460) Phrantza retired to the monastery of Tarchaniotes in Corfu, where he wrote his valuable *Chronicle*, embracing the period of Byzantine history from 1259 to 1477, edited by Bekker (Bonn, 1838), and also in Migne's *Patrologia Græca*. Consult Carl Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897).

PHRASE (Lat. *phrasis*, from Gk. *φράσις*, manner of speech, from *φράσσειν*, *phrassein*, to declare). The name given, in music, to the simple motives containing in themselves no satisfactory musical idea, which enter into the composition of every melody containing a perfect musical idea. (See FORM.) The word "interpretation" denotes, in music, a number of notes corresponding to a sentence in speech. See PHRASING; TYPICAL PHRASE.

PHRASING. The proper rendering of musical phrases. (See PHRASE.) A musical composition is analogous to a literary one, the sentences being replaced by phrases; on their correct interpretation depends the intelligible presentation of the whole piece. One of the most important elements of phrasing is accent (q.v.), the general principles of which will be found under RHYTHM; but in no case must an accent be so insisted on as to break the unity of the musical phrase. On the contrary, the ordinary accent is often postponed or anticipated in order to emphasize the general effect of the phrase. For the same reason, especially in rapid passages, accents are often added; while in quick movements accents are sometimes omitted so as to give an impression of unity to a number of separate bars. Breaking up a group of notes which together form a musical sentence and running together two distinct sentences are two common faults in phrasing. In instrumental work, especially, there is a tendency to make a break at the end of a bar; but in reality a sentence always ends on the accented division of a bar, the bar stroke having absolutely no relation to phrasing. In vocal music the musical accents correspond with those of the text, and the phrases are, as a rule, dependent on the lines or word sentences. Vocal phrasing, therefore, is obviously much simpler than instrumental. The signs most commonly used to in-

dicate phrasing are the dash, the curved line, denoting *legato*, and the slur; but the interpretation of any composition is to a great extent a matter of personal appreciation and discrimination. Consult M. Lussy, *Traité de l'expression musicale* (7th ed., Paris, 1897); C. A. Ehrenfechter, *Delivery in the Art of Pianoforte Playing* (London, 1897); A. J. Goodrich, *Theory of Interpretation* (Philadelphia, 1899); T. Matthay, *Musical Interpretation* (Boston, 1913).

PHRATRY (Gk. *φρατρία*, *phratría*, from *φάτρης*, *phátēs*, a word akin to Lat. *frater*, brother, Ger. *Bruder*, brother, Eng. *brother*). At Athens, a subdivision of the phylæ (q.v.), whose members, at least originally, were all connected by ties of blood. For admission to the phratry, see GREEK FESTIVALS, *Apaturia*.

PHRENOLOGY (from Gk. *φρήν*, *phrēn*, heart, mind + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The theory that the mind consists of localized independent faculties, each one in a region of the brain whose size indicates the degree of the faculty resident in it. Franz Joseph Gall (q.v.), an eccentric Viennese physician, announced about 1796 the discovery of a system of phrenology. He asserted that he had reached it empirically by examining the heads of individuals who exhibited unusual mental or moral endowments. He thus worked out correlations between the topography of the skull and traits of character. He further concluded that the size and configuration of the brain are represented by those of the skull. His lectures, begun in 1796, ceased at the order of the Austrian government in 1802, his doctrines being judged to be inimical to morality and religion. In 1804 he associated with him his pupil, Johann Kaspar Spurzheim (q.v.), and the two traveled through Germany and Switzerland to France. In Paris the French Institute appointed a commission to investigate their assertions. The commission reported favorably on methods of dissection, etc., but declared their main conclusions hypothetical. In 1809 the two began the publication of a work entitled *The Anatomy and Physiology of the Nervous System in General, and of the Brain in Particular, with Observations upon the Possibility of Ascertaining Several Intellectual and Moral Dispositions of Man and Animals by the Configuration of their Heads*. Gall died in Paris in 1828, respected and honored. Spurzheim went to America in 1832, but died shortly after his arrival at Boston.

The fundamental tenets of phrenology are that the brain is the material substrate of mind; that it is a multiplex structure, composed of a definite number (originally 34, now 42) of constituent organs, each one the seat of a particular power of the mind—a "sentiment," a "propensity," or an "intellectual faculty." Furthermore, these 42 organs constitute a series of cones with their apices at the oblongata and their bases at the surface. Every prominence in the skull indicates the size of the organ beneath it, and thus the development of the correlated mental faculty. The propensities or passions, situated at the lower and posterior part of the brain, are Amativeness, philoprogenitiveness, continuity, adhesiveness or friendship, combativeness, destructiveness, etc. The sentiments, situated at the superior portion of the cranium, are self-esteem, love of approbation, cautiousness, firmness, benevolence, etc. The intellectual faculties in the anterior region are individuality, form, space or size, weight or resistance, color, locality, etc.

In diagnosis the size of the prominence determines the degree of the faculty only when taken in conjunction with other tendencies, for one faculty may aid or inhibit the function of another.

From the standpoint of science phrenology is related to modern neurology as astrology to astronomy or alchemy to chemistry. It served a useful purpose in stimulating the investigation of cortical function, in enforcing the dependence of mind upon brain, and in offsetting the views of men like Magendie and Flourens, that the brain functions homogeneously throughout. But in the light of modern knowledge phrenology is bad psychology and bad neurology. Modern psychology does not regard the mind as a bundle of faculties. Neurologically, too, there are many disproofs of phrenology. Different skulls have a different thickness, prominences do not necessarily show the size of the brain beneath, three-fifths of the gray matter of the cortex is concealed in the sulci; accident or disease destroys or impairs sensory or motor functions connected with some sense department or some association system, not some faculty. Finally, the whole structure of phrenology falls with the investigations of cortical localization by the methods of degeneration, electrical stimulation, medullation, and extirpation. See **PHYSIOLOGY**.

Spurzheim, *Phrenology* (Philadelphia, 1911).

PHRIXUS, φρίξ'σ'ς (Lat., from Gk φρίξος). In Greek legend, the son of Athamas and Nephele. With his sister Helle he was rescued by his mother when about to be sacrificed to Zeus, and carried to Colchis on a ram with golden fleece. On the journey Helle fell into the water and was drowned. This part of the sea was called after her the Hellespont. The fleece of the ram, given to King Autes and hung in the grove of Ares, was the object of the Argonautic Expedition. See **ARGONAUTS**.

PHRYGIA, φριγ'ία (Lat., from Gk φρυγία). A country in Asia Minor, the extent and boundaries of which varied very much at different periods of ancient history (Map: Greece, Ancient, G 2). Originally the east boundaries were the river Halys and the territory about Iconium, the last Phrygian city; towards the south, Phrygia touched the Taurus and the Pisidian Mountains; on the north it reached the Hellespont and the Propontis; on the west it seems to have included the Troas and Mysia, and may have held suzerainty over Lydia and Caria. Later invaders from Thrace, who occupied Bithynia and Mysia, cut this region into two parts—Little Phrygia, a somewhat indefinite region south of the Hellespont, and Greater Phrygia, which alone preserved the national character. This was bounded on the north by Bithynia and Paphlagonia, on the east by Pisidia, Lycania, on the south by Cappadocia, and on the west by the maritime countries of Mysia, Lydia, and Caria. The boundaries were further modified by the Gallic invasion of the third century B.C. (See **GALATIA**.) Pergamene conquests added part of southern Bithynia, including the important city of Dorylaeum, under the name of Phrygia Epictetus. For

purposes of provincial administration the Romans divided Phrygia, attaching the northeastern part to the Province of Galatia and the western portion to the Province of Asia. Phrygia was in general a high and somewhat barren plateau, though its pastures supported enormous flocks of sheep noted for the fineness of their wool, as indeed they still are. The most fertile part was the valley of the Sangarius, but the most beautiful and populous district was the southwestern, at the base of the Taurus, where the Mæander and other streams had their rise, and here were the chief cities, Synnada, Celenæ, Apamæa, Colossæ, Laodicea, while farther to the east lay Antioch. The mountains and streams yielded gold. Phrygian marble was anciently celebrated, and the cultivation of the vine appears to have been extensively carried on.

The Phrygians were certainly an Indo-European race, and appear to have entered Asia Minor from Thrace, pushing into the interior from the Troad along the valley of the Sangarius, making themselves masters of the whole tableland and probably extending their sway over the Asiatic tribes on the coast. We hear of a race of powerful kings alternately bearing the name of Gordius and Midas, and in the mountains near the headwaters of the Sangarius are the great rock-cut tombs or façades which were associated with these rulers. The invasions of the Cimmerians (c.675 B.C.) appear to have broken their power, and thenceforth they played no part in history, but fell first under the rule of the growing Lydian kingdom, then successively under that of Persia, Macedon, Pergamum, and Rome. They appear to have been a peaceful rustic people, devoted to agriculture and cattle raising. Their religion was an ecstatic nature worship in which the Great Mother of the Gods, Rhea or Cybele, and a male deity, Sabazius, played a great part. The orgiastic rites and wild music seem to have exercised considerable influence on the Greeks and the Romans, and we find the Phrygian deities transplanted to the Western world.

PHRYGIAN (frij'j-an) **CAP.** See **LIBERTY CAP**.

PHRYGIAN LANGUAGE. The native language of the Phrygians is known partly through glosses preserved by Hesychius and other lexicographers and authors, partly through inscriptions found in the territory once occupied by this people. Tombs with inscriptions were discovered in the valley of Doghanla by Colonel Leake in 1820. Four of these inscriptions, including that on the sepulchre of King Midas, were first published by Hamilton in 1842. A number of additional inscriptions were published by Ramsay in 1883; others copied by himself and Sterrett appeared in 1884. A complete collection of the Phrygian inscriptions of the Roman period, so far as known at the time, was published by Ramsay in 1905, and a corpus of all Neo-Phrygian inscriptions, over 60 in number, was produced

by Calder in 1911. Many of these are in Greek, but have Phrygian additions at the end. That the additions contain formulas of execration was first surmised by Schmidt in 1869. The researches of Ramsay and Fick have corroborated this conjecture. As Herodotus (vii, 73) and Strabo (xlvii, ccxcv) declare that the Phrygians were related to the Armenians and the Thracians, it was natural that the language should be supposed to be Armenian. That was done by Mordtmann and Gosche. A collection of 63 glosses was made by Lagarde. He concluded that the Phrygians were derived from the Thracians and that their Iranian character was proved by such words as *ἀδάμνα* and *κύρβαττ*. Since Hübschmann's investigations have shown that the Armenian is not an Iranian language, but belongs to an independent branch of the Indo-Germanic family, including the Thracian, the Phrygian, and possibly the Lydian and Mysian as well as the Armenian, Ramsay, Beloch, Meyer, and others no longer think of an Iranian derivation. This is in harmony with the now generally accepted view that the Phrygians invaded Asia Minor from Thrace about the twelfth century B.C. While most of the monuments found belong to the Roman period, there are some that have plausibly been assigned by Ramsay to the end of the eighth century B.C. If one doubtful letter is an *χ* rather than a *ψ*, as seems probable, the Phrygians apparently received their alphabet, not from the Ionians, but from the old *Æolians*. After the Phrygian language had been supplanted by the Greek it still maintained itself in imprecations, believed to be more efficacious in the speech of the fathers. The same alphabet has been found at Abu-Simbel in Egypt in inscriptions that must date from the time of Psammetichus II (594-588 B.C.) and in an inscription found in Lemnos in 1886 in an unknown language and of uncertain age.

PHYRYNE (Lat., from Gk. *Φύρις*). One of the most celebrated courtesans of antiquity. She was a daughter of Epicles and was born at Thebes in Boeotia. She was of very humble origin, and is said originally to have gained her livelihood by gathering capers, but her beauty afterward brought her such wealth that, when Alexander destroyed the walls of Thebes, she is said to have offered to rebuild them if she

might be allowed to inscribe on them the words: "Alexander destroyed them, but Phryne, the courtesan, rebuilt them." Being on one occasion accused by Euthias of profanation of the Eleusinian mysteries, she was summoned before the court of the Heliasts and was there defended by the orator Hyperides. When Hyperides saw that the verdict of the court was likely to be unfavorable he threw aside her veil and exposed her bosom and shoulders. The judges thereupon acquitted her, and she was carried in triumph to the temple of Aphrodite. She served as the model for Praxiteles' "Cnidian Venus" and for the "Venus Anadyomene" (q.v.) of Apelles (it was said that she suggested the latter picture to Apelles when, on the occasion of a festival of Eleusis, she entered the sea, unclad, in the presence of the assembled throng). Her neighbors dedicated to her at Delphi a gilded statue resting on a base of Pentelic marble, the whole the work of Praxiteles. There is preserved in Athenæus an epigram in her praise, written by Praxiteles and inscribed on a statue of Cupid, which Praxiteles presented to her and which she dedicated at Thebes.

PHYRYNICHUS, *φρίνικος* (Lat., from Gk. *Φρύνιχος*). 1. A Greek tragic poet of Athens, an older contemporary of *Æschylus*. He won his first victory in 511 B.C. and his last in 476, when Themistocles was his *choragos*. Like *Æschylus*, he is said to have died in Sicily. In all the accounts of the rise and development of Greek tragedy, Phrynichus is ranked immediately after Thepsis (q.v.), and according to some critics he should be regarded as the real inventor of tragedy. He was the first to bring female characters on the stage; for the light satyr plays of his predecessors he substituted plays on serious subjects taken both from the heroic age and from the history of his own time; and he was the first to introduce an actor distinct from the leader of the chorus and thus to open the way for the development of dialogue. In his works, however, the lyrical choruses still retained the principal place, and these are said to have been so celebrated that they were sung even in the time of Aristophanes. Of his plays the most important were *Φούρλοισι*, *Phænissæ*, which dealt with the defeat of the Persian invaders (480 B.C.) and is said to have been copied by *Æschylus* in *The Persians*, and *Μιλήτου ἄλωσις*, *Miletou Halôsis*, on the capture of Miletus by the Persians. According to Herodotus the Athenians were so moved by the latter tragedy that they fined the poet 1000 drachmas for recalling to them the disasters of their kinsmen, and passed a law forbidding further performances of the piece. Only a few fragments and the titles of nine of his plays are extant. Consult: Nauck, *Tragicorum Græcorum Fragmenta* (Leipzig, 1856); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (6th ed., Munich, 1912).

2. A poet of the Old Attic Comedy, contemporary with Aristophanes (q.v.). He wrote at least 10 plays between 429 and 405 B.C. For the fragments, see Theodor Kock (ed.), *Comicorum Atticorum Fragmenta*, vol. i (Leipzig, 1880).

3. A Greek grammarian and lexicographer, a native of Bithynia, who lived in the second century A.D. His writings include a work on Attic words, in two books, and *Σοφιστικὴ Παράσκευη* (*Sophistical Equipment*), a lengthy work. For

a fragment of this work, see I. Bekker, *Aneodota Græca* (1814). We still have Phrynichus' *Selection of Attic Words and Phrases*, a collection of current words and forms of words which differ from the true old Attic standard; the Attic equivalent in each case is given. This work was edited by C. A. Lobeck (1820) and by W. G. Rutherford, in *The New Phrynichus* (1881). Consult also: G. Kaibel, *De Phrynicho Sophista* (Göttingen, 1899); J. E. Sandys, *A History of Classical Scholarship* (2d ed., Cambridge, 1906); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

PETHIOTIS, pthi-ō'tis (Lat., from Gk. Φθιώτις). In ancient geography, the southern part of Thessaly, north of Ænis and Malis and west of the Pagasæan Gulf. The district was famous in the epic as the home of Achilles, and from this region the Æolian colonization of Asia Minor is thought by some scholars to have gone forth. The population, though maintaining a Thessalian element, was considered to be Achæan. The chief cities were Phthiotian Thebes, Larissa, Lamia, Melitæa, and Thaumaci.

PETHISIS, pthi'sis. See TUBERCULOSIS.

PHYCOCYANIN (from Gk. φῦκος, *phykos*, seaweed + κυανός, *kyanos*, blue) The blue pigment peculiar to the blue-green algæ, in which it is associated with a green pigment, resulting in a characteristic bluish-green tint. See CYANOPHYCEÆ.

PHYCOERYTHRIN, fi'kō-ēr'i-thrin (from Gk. φῦκος, *phykos*, seaweed + ἐρυθρός, *erythros*, red) The red pigment of the red algæ contained in the chromoplasts, giving the general tint of the plant body, and of course associated with the green pigment chlorophyll. See RHODOPHYCEÆ.

PHYCOMYCETES, fi'kō-mī-sē'tēz (Neo-Lat. nom. pl., from Gk. φῦκος, *phykos*, seaweed + μύκης, *mykēs*, fungus). A group of plants which comprises, as the name indicates, those fungi most resembling the algæ (See FUNGI). The Phycomycetes include the black molds (Mucorales), certain insect parasites (Entomophthorales), the water molds (Saprolegniales), and a group of very important plant parasites included in the order Peronosporales. The simplest of the Phycomycetes are unicellular aquatic forms (Chytridiales) that usually live parasitically in the cells of algæ. These representatives are most often observed in a quiescent condition, in the form of thick-walled spores or resting spore cases, but there are motile periods in the life history when the organisms swim freely in the water. The Entomophthorales are mostly parasitic on insects, preferring the Diptera and Orthoptera, a common representative (*Empusa*) being found on the house fly. Late in the summer and in the autumn dead house flies may frequently be observed attached by their probosces to window panes, walls, and other surfaces, with a halo of yellowish powder on the surface around them. This powder is made up of spores that have been thrown off from the ends of fungal filaments, which after filling the body of the insect have grown through the segments to the exterior. The large common molds (Mucorales) are frequently called black molds because of the color of the spore cases (sporangia) and to distinguish them from the green and yellow mildews. They are saprophytes, growing upon organic matter in damp places, the bread mold (*Mucor*) being a

familiar example. The vegetative portion of the molds (mycelium) consists of conspicuous threads (hyphæ) plainly visible to the eye,

WHITE MILDREW (*Albugo candida*)

a, oogonium, b, antheridium, c, oospore, d, swarm spores escaping from oospore, e, swarm spores, f, conidia; g, swarm spores escaping from conidium, h, the same, more distinct.

which grow over the substratum and when possible penetrate it in all directions. The commonest fructification is a black swollen head

GRAPE MILDREW (*Plasmopara*)

a, the branching sporophores arising from the surface of the host; b, a germinating spore; c, a swarm spore.

(sporangium) containing thousands of spores and borne at the end of an erect branch (sporangiophore). The Peronosporales are an assem-

blage of forms, mostly parasitic, and contain some fungi responsible for such serious diseases as the rot of potato and the downy mildews of grapes. (See *Diseases* under GRAPE and POTATO.) Another troublesome form, sometimes

DOWNY MILDEW OF POTATOES (*Phytophthora infestans*).
Cross section of leaf showing growth of mildew.

placed among the Peronosporales and sometimes among the Saprolegniales, is *Pythium*, the fungus responsible for the damping off (q.v.) of seedlings. The water molds (Saprolegniales) have habits widely different from other Phycomycetes, being aquatic and living on dead insects, fish, and frogs, and sometimes on the living animals. They surround the body with a beautiful halo of delicate radiating filaments. These fungi sometimes cause epidemics in fish hatcheries, where they attack the mouths and gills of young trout and salmon. Consult: Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887 et seq.); B. M. Duggar, *Fungous Diseases of Plants* (Boston, 1909); G. E. Massee, *Diseases of Cultivated Plants and Trees* (New York, 1910); F. L. Stevens, *The Fungi which Cause Plant Disease* (ib., 1913).

PHYCOPHÆIN (from Gk. *phûkos*, *phykos*, seaweed + *phaios*, *phaios*, dusky). A brown pigment characteristically present in the cells of the brown algae, in which it is associated with other pigments, such as phycocyanin and chlorophyll. See **PHÆOPHYCÆE**.

PHYLACTERY (Lat. *phylacterium*, from Gk. *φυλακτήριον*, *phylaktērion*, safeguard, amulet, from *φυλακτήρ*, *phylaktēr*, sentinel, guard, from *φυλάσσειν*, *phylassein*, to guard). An amulet (q.v.) or charm worn as a protection against evil influences. In the New Testament the name is given to a strip of fine parchment inscribed with certain passages from the Scriptures (Ex. xiii. 1-10, xiii. 11-16; Deut. vi. 4-9, xi. 18-21) and inclosed in a small leathern case. This was, in accordance with a literal interpretation of Ex. xiii. 9-16; Deut. vi. 8, 9, 18, fastened by leathern straps to the forehead, just above and between the eyes, or to the left arm, at the point where the arm, hanging down, falls nearest the heart; sometimes it was fastened to the doorpost.

PHYLÆ (Lat. nom. pl., from Gk. *φυλή*, *phylê*, tribe). In Greek political institutions, the tribes or clans, originally perhaps embracing all the inhabitants of a district, though in

many cases membership in the phylæ seems to have rested on a theory of common descent rather than on residence in a given district. Among the Dorians we regularly find the three tribes, Hylleis, Dymanes, and Pamphyli; at Miletus in Ionia and at Athens we find Geleontes, Argadeis, Ægicoreis, and Hopletes, and these names recur in other Ionian communities. The most important development of the tribe was in the reorganization of the Athenian democracy by Clisthenes (q.v.) after the expulsion of the tyrant Hippias (510 B.C.). The four old tribes were swept away and the whole people divided into 10 tribes, on the basis of the demes (see **DEME**) in which the people were registered. The demes in each tribe were so selected that the three divisions of Attica, mountain, coast, and plain, were all represented. The tribes, which were named from heroes, were Erechtheis, Ægeis, Pandionis, Leontis, Acamantis, Ceneis, Cecropis, Hippothontis, Eantis, Antiochis. The tribes were organized as corporations, and held regular meetings, apparently at Athens, but not in their own halls. The executive officers were the Epimeletæ and a treasurer who had charge of the property of the tribes, for, as each eponymous hero had priest and sanctuary and received a certain part of all booty in war, the tribe had to manage certain lands and investments. The tribe chose its representatives on state commissions, where work was divided among the tribes, such as the repair of walls, etc. They also elected the rich men, whose duty it was to provide the choruses for intertribal competition at the festivals or other similar public duties laid upon the rich. The military organization was based on the tribal division, for each tribe furnished a regiment of infantry under a taxiarh and a squadron of cavalry under a phylarch. Though the Senate was composed of 50 from each tribe, the Senators were not chosen by the tribe but by the demes, among whom they were apportioned on the basis of population. Consult the article "Tribus" in W. Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891). See **ECCLESIA**.

PHYLAKOPI, *fé-lá'kô-pé*. The name of a modern site on the northeast coast of the island of Melos (q.v.), excavated in 1896 by the British School of Classical Studies at Athens. Important remains of a pre-Mycenæan civilization were found, including houses, a palace, a town wall, and pottery. Consult H. M. Fowler and others, *A Handbook of Greek Archaeology* (New York, 1909), and H. R. Hall, *Ægean Archaeology* (London, 1915).

PHYLARCHUS, *ft-lär'kûs* (Lat., from Gk. *Φύλαρχος*) (c.210 B.C.-?). A Greek historian. He was born probably at Naucratis in Egypt, but spent most of his life at Athens. His great work was a history of Greece, embracing the 52 years between the invasion of the Peloponnesus by Pyrrhus (272 B.C.) and the death of Cleomenes III, King of Sparta (221 B.C.). His style was graphic and animated, but, according to Polybius (ii, 56), he frequently falsified history on account of his passionate admiration for Cleomenes. The work was used by Trogius Pompeius and by Plutarch in his lives of Cleomenes and Aratus. The few extant fragments have been edited in Müller's *Fragmenta Historicorum Græcorum*, vol. i (1841). Consult F. Susemihl, *Geschichte der griechischen Literatur in der Alexandrinerzeit*, vol. i (Leip-

zig, 1891), and Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

PHYLAXINS. See IMMUNITY.

PHYL/LIS (Lat., from Gk. Φυλλίς). 1. A Thracian princess, betrothed to Demophoön, the son of Theseus, who left her to go to Athens, promising to return at a certain date. When the appointed time had passed without his arrival, Phyllis killed herself and was changed into an almond tree, which put forth leaves only when Demophoön shortly afterward returned and embraced it. 2. In pastoral poetry, a name conventionally used of a maiden or a ladylove.

PHYLLOCAR/IDA (Neo-Lat., from Gk. φύλλον, *phyllon*, leaf + *kaps, karis*, shrimp). A highly composite or generalized order of Crustacea, separated by Packard from the Phyllopoda. The group is represented at the present time by *Nebalia* and its allies (*Nebaliidae*) of the North Atlantic, forming the Leptostraca of Claus; also by fossil forms from the Cambrian period to the end of the Carboniferous, some of which were more than a foot in length, while *Nebalia* itself is about half an inch long. In *Nebalia* the body is compressed and protected in

A PHYLLOCARID (*Nebalia bipes*).

front by a bivalved carapace, closed by a weak adductor muscle, but without a hinge, the rostrum is free, movable; the eyes are stalked, the eight pairs of thoracic legs resemble those of phyllopod crustacea, and the hind body is modeled on that of a copepod crustacean such as *Cyclops*. It undergoes no metamorphosis and is an example of the persistence of type from very early geological times

PHYLLOCLAD (from Gk. φύλλον, *phyllon*, leaf + κλάδος, *klados*, branch), or CLADOPHYLL. A branch that functions as a leaf, which it resembles in form and color. Well-known illustrations are leaves of smilax and asparagus.

PHYLLODES (from Gk. φυλλάδιος, *phyllōdēs*, leaflike). Leaves represented only by their petioles, the blades not having developed. Often such petioles develop as bladelike organs that replace regular blades. In the case of dicotyledons phyllodes may be distinguished from true leaves by the parallel veining and also by presenting their edges up and down (profile position). The greatest display of phyllodes is found among the acacias of Australia, where nine-tenths of the numerous species have phyllodes instead of true leaves. The normal blade of these acacias is pinnately compound, as is shown by their seedlings, and occasionally when older growths are subjected to unusual conditions. The first leaves of many plants are phyllodes, as in *Cicuta bulbifera*; and the submerged leaves of water plants are often phyllodes,

as in *Sagittaria heterophylla*. In the case of pitcher plants (see CARNIVOROUS PLANTS) the urns, tubes, etc., are usually regarded as hollow phyllodes, the true blade being represented by the somewhat conspicuous lids.

PHYLLOGRAP/TUS (Neo-Lat., from Gk. φύλλον, *phyllon*, leaf + γραφτός, *graptos*, written, from γράφειν, *graphein*, to write). A genus of fossil graptolites, index fossils of the Lower Ordovician rocks of North America and northern Europe. The thecae, or cells in which the animals lived, are arranged in four rows with their dorsal sides united along a common axis to form a four-bladed colony, the blades of which are at right angles to one another. See GRAPTOLITE.

PHYLLOP/ODA (Neo-Lat. nom. pl., from Gk. φύλλον, *phyllon*, leaf + ποῦς, *pous*, foot). An order of fresh-water Crustacea, in which the legs are broad and leaflike, subdivided into lobes,

PHYLLOPOD CRUSTACEANS.

1, *Branchinecta coloradensis*, 2, shell of *Estheria belfragei*, 3, *Lepidurus couesi*.

and adapted for respiration as well as locomotion. The trunk is not differentiated into a thorax and abdomen. The eyes are usually simple or compound, and either sessile (*Apus*) or stalked (*Branchipus*), while there is a median simple eye retained from the nauplius stage. The number of body segments varies greatly, and the body is usually protected by an ample shell consisting of two valves closed by an adductor muscle. In the group represented by *Branchipus* and the brine shrimp (*Artemia*) there is no shell. These crustaceans are very primitive and apparently are the ancestral forms of the class Crus-

PHYLLOPODA AND LARVÆ.

Adult of *Apus aequalis*; and (a) larva of *Apus cancriformis*, (b) nauplius of *Artemia salina*.

tacea (q.v.), their limbs being much like the parapodia of annelid worms. A Cambrian form (*Protocaris*) is supposed to be allied to *Apus*. All the members of this order hatch in the nauplius stage and after a series of molts attain

the adult form. The phyllophods live in pools liable to dry up in summer. Their eggs are of two kinds, summer and winter, the latter being protected by a dense shell, so that they can dry up and live for months or years, the young hatching when the eggs are moistened by the refilling of the pools or ditches. In some species the males have not yet been found. Consult A. S. Packard, *A Monograph of North American Phyllopod Crustacea* (Washington, 1883). See BRINE SHRIMP.

PHYLLOTAXY (from Gk. φύλλον, *phyllon*, leaf + τάξις, *taxis*, arrangement). Leaf arrangement, i.e., the methods in which leaves are disposed upon their axes. See LEAF.

PHYLOXERA (Neo-Lat. nom. pl., from Gk. φύλλον, *phyllon*, leaf + ξηρός, *axeros*, dry). An insect of American origin (*Phylloxera vastatrix*), which belongs to the aphid family, and which, accidentally introduced into France about 1859 upon native American vines, spread through the principal vine districts of southern Europe, causing enormous damage. It has further spread into Algeria and through southern Russia into the adjoining countries of Asia. It has been carried into New Zealand and South Africa, also, as well as some parts of Australia. It was at first known in the United States only in the region east of the Rocky Mountains, but was afterward found in California, where it is confined to those vineyards in which the European vine is grown from its own roots.

The Phylloxera is indigenous to North America, where it has always existed on the wild vines. It occurs in four forms—the leaf-gall form (*gallicola*), the root form (*radicicola*), the winged or colonizing form, and the sexual form. The sexual insect lays the winter egg on the old wood. The young one hatching in the spring proceeds to a young leaf and deposits itself upon the upper surfaces, gradually forming a gall about itself which projects from the lower side of the leaf. It reaches full growth in 15 days and fills its gall with small yellow eggs numbering from 500 to 600. These eggs hatch in eight days, and the young migrate to all parts of the vine to form new galls. Six or seven generations of these wingless females follow one another through the summer, frequently covering the leaves with galls. At the approach of cold weather the young proceed to the roots, remaining dormant until spring. In the spring the root is attacked by a series of generations of wingless females, which produce swellings on the rootlets. During the late summer and autumn some of the root lice give birth to winged females, which escape through the soil and fly to neighboring vines, laying their eggs on the bark. From these eggs the sexual generation issues and the life cycle is begun again. The root form, however, may proceed in successive broods for a number of years, as is the case with the European vines, on which the leaf form rarely occurs. The insect is spread by the flight of the winged females, by the migration of the root lice through cracks in the soil, and by the carrying of the leaf-gall lice by winds, by birds, and by other insects, and further by the shipping of infested rooted plants or cuttings bearing the winter eggs. The leaf form is especially noticeable on American vines and is common on the wild vines. The root form is rarely seen, but it is the cause of the only severe injury to the plant. When the insect occurs plentifully the death of the vine in a few years is certain. The

root lice first produce enlargements on the rootlets, extending their work to the larger roots. These become swollen and broken and finally die and rot. The vine stops growing, the leaves become sickly and yellowish, and since the Phylloxera disappears from the dead roots, the cause of the death of the plant is frequently obscure. The European vine (*Vitis vinifera*) is particularly subject to attacks of the root form, while most American vines, although frequently carrying the leaf galls, are more or less immune to root attacks.

The remedies used for this pest are the subterranean injection of bisulphide of carbon and the submersion of the roots by inundating vineyards by water at certain seasons of the year. The standard preventive now employed all over the world is the use of American vines as stocks on which to graft the susceptible European varieties. The immunity of the American vines seems to be owing to the thicker bark covering of the roots and to a greater natural vigor. The chief resistant varieties of American vines are the *Æstivalis*, the *Riparia*, and the *Labrusca*. Some American vines, however, as the Delaware, are almost as susceptible as the European vines. The varieties of the *Æstivalis* most used are the *Herbemont* and *Cunningham*; of the *Riparia*, the *Clinton*, *Taylor*, and *Solonis*. Consult C. L. Marlatt, "Principal Insect Enemies of the Grape," in *United States Department of Agriculture, Farmers' Bulletin*, No. 70 (Washington, 1898).

PHYLOGENY (from Gk. φύλον, *phylon*, tribe + -γένεια, *-geneia*, production, from γίγνεσθαι, *gignesthai*, to become). While ontogeny (q.v.) is a term expressing the development (embryology) of the individual, phylogeny means the development or genetic history of the members of the group or class as a whole. The conception of such a process did not arise until a multitude of facts had been accumulated during the study of the embryology of different animal types, the results being further checked and complemented by the facts of paleontology. The doctrine or theory of phylogeny, then, rests (1) upon a series of life histories of animals, including their embryonic and postembryonic stages of development; (2) upon what we know of the geological succession of animal forms, and (3) upon the theory of descent. Phylogeny is the equivalent of genealogy and involves the idea of blood relationship. A genealogical tree of a single human family, when carried out through many generations, is almost indefinitely branched and subdivided, the members or descendants from the earliest human pair affording an instance of divergent evolution. The ancestral tree or pedigree of any class of animals is a matter of theory, but the facts of affinity and homology are so numerous and natural that the theory is fairly well grounded. The phylogeny of any group is an expression of one's view of classification, and since in respect to many groups there is a divergence of opinion as to the systematic position of this or that member, so the views as to the pedigree of certain classes or general groups differ with different systematists. The success of the endeavor to work out a phylogeny of any group depends very largely on knowledge of the earlier fossil forms; yet each attempt leads to the more careful study of this or that characteristic, to tracing its growth, development, and final disappearance, or replacement by a later acquired feature,

while the mental discipline resulting tends to render the work of the systematist more philosophical. See EVOLUTION; PALEONTOLOGY.

PHYLOGEOGRAPHY. See GEOGRAPHY.

PHYLUM (Neo-Lat., from Gk *φύλον*, tribe). A term given by Haeckel to the primary divisions of the animal and vegetable kingdoms, which has now generally superseded the old terms "subkingdom," "branch," and "type." A phylum is a primary group either of animals or of plants, all the members of which are supposed to be blood relations descended from one and the same stem, or ancestral, primitive form. The members inherit a mode of development, larval or nepionic stages of postembryonic development, and adult structures which taken together make them differ from those of other phyla. See CLASSIFICATION OF ANIMALS; PHYLOGENY.

PHYSA (Neo-Lat., from Gk *φύσα*, pair of bellows, breath, bubble). A small pond snail abounding in quiet fresh waters throughout the warmer parts of the world. It is closely allied to the *Limnæa*, but the whorls of the amber-

PHYSA

colored shell revolve from right to left, instead of from left to right as is the rule among spiral shells. A very widespread species in the United States is *Physa heterostrophæ*.

PHYSA'LIA. See PORTUGUESE MAN-OF-WAR.

PHYSALIS (Neo-Lat., from Gk *φυσάλλis*, *physallis*, plant with husks like bladders, bladder, from *φυσάν*, *physan*, to blow, from *φύσα*, *physa*, bellows, breath, bubble). A genus of annual and perennial herbs and shrubs of the family Solanaceæ, remarkable for the calyx, which becomes large and inflated after flowering is over and incloses the ripened berry. The species are natives of temperate and warm climates and are widely scattered over the world. The common winter cherry (*Physalis alkekengi*) is a perennial, native of southern Europe and a great

WINTER CHERRY (*Physalis alkekengi*).

part of Asia, growing in vineyards and bushy places. It is also widely scattered in the United States. The berries, which have a sweetish subacid taste, are often eaten. Among the American species perhaps the following are best known: the downy winter or ground cherry, *Physalis pubescens*, the strawberry tomato, *Physalis pruinosa*, *Physalis peruviana*, *Physalis sub-*

glabrata, *Physalis angulata*. Some of these are cultivated in gardens to a small extent. Their fruits make good preserves. In Hawaii the famous poha preserves are made from *Physalis peruviana*. The Chinese lantern plant is *Physalis franchetii*.

PHYSICIA, fis't-a. A lichen. See Plate of LICHENS.

PHYSICAL EDUCATION. That part of education which employs the motor activities of the individual as a means. The term has been used, as in Spencer's *Education*, to include the entire personal hygiene of childhood and youth. Others have understood by it the systematic exercise of the neuromuscular mechanism for the correction of defects or deformities, for the restoration or preservation of health, and to secure ready control of the human machine and right motor habits—a view which makes the physical results the chief or only ones. A better usage, and one more in conformity with the present conception of man's nature as a unit, is that which regards his motor activities as a means of influencing for good the entire individual, in mind and character as well as in body; it employs the word "physical" to denote the means and not the end. "Physical training" is nearly or quite synonymous, with perhaps more emphasis on practice and less on the element of instruction. "Physical culture" is a term of doubtful standing, due in part to its frequent use by charlatans. It suggests pretense and unreliable measures.

History. In ancient Greece the Athenian father was required to provide his son with instruction in music and gymnastics. The former, which included literary branches, reached primarily the intellect and the emotions, while the latter trained the body and the will. The gymnastic exercises, practiced in private schools (*palæstræ*) and usually given out-of-doors, were little more than orderly contests in wrestling, running, jumping, and throwing the spear and the discus. The importance attached to such discipline and the interest it aroused made these same exercises the chief feature of the public gymnasia, which in the time of Pericles every important Greek town seems to have provided for its male citizens, and at the great national festivals which helped to bind together the politically distinct members of the race. Among the Romans military training and the life of the camp furnished the only systematic bodily discipline. During nearly the whole of the period of conquest which led to universal empire, and until within less than a century of the Christian era, every citizen except those of the lowest class was liable to military service for 30 years after his entrance into man's estate.

Formal education throughout the Middle Ages reflects the influence of asceticism, which soon became a part of the accepted teaching of the Church and the practice of a large proportion of her leaders and adherents. Mortification of the body had acquired the dignity of a religious exercise and was viewed as a means and measure of human excellence. In the monastery and cathedral schools, the chief seats of learning from the sixth till the twelfth century, and in the mediæval universities of a later period, physical training therefore had no place. But meanwhile the hermit of early Catholic legends was gradually displaced as a popular hero by the knight, and military Christianity, as typified in the three orders of soldier monks which had

their origin in the twelfth century, could not fail to weaken the hold of the ascetic ideal. The training of the knight stood in sharp contrast to the education imparted in the monasteries, and the tournaments common all over Christendom in the thirteenth and fourteenth centuries afforded a public spectacle no less brilliant, fascinating, and characteristic of the age than were the Panhellenic games.

But it is not until we reach the fifteenth and sixteenth centuries, the period of the Renaissance and the Reformation, that we find men escaping from the authority of that theological dogma which made the soul the one object of solicitude and regarded the body with contempt. Appreciative study of the Greek and Latin classics and all the long-neglected records of ancient civilization supplied the Western nations with a new ideal of life and culture. Writers on education, influenced by their classical studies and also by the customs of chivalry, which had not ceased to shape the early training of the gentleman, now began to speak in commendation of bodily exercise and recognition of its rights to a place in the curriculum, referring constantly to ancient Greeks and Romans as authorities or by way of illustration. It was especially among the upper classes that this interest in physical activities manifested itself. Physical well-being and good carriage as much as intellectual polish now came to be the marks of the gentleman. In this aspect of the educational ideal there coalesced both the ideas of classical tradition and the practices of the courtly and military training of the period. Physical culture and carefully devised gymnastics are accordingly found in the earliest and the most notable of the humanistic schools, that of Vittorino da Feltre at Mantua. The humanistic writers on education have in mind both the physical and moral effects of physical exercises. The tradition thus continued from the classical period was handed on, in turn by the development of special educational practices for the upbringing of the gentry. It may perhaps have been due to the influence of the Protestant Reformation that less attention was given to physical training in the schools more generally attended. In the education of the nobles, in the courtly academies, it played an important part. These schools appeared towards the close of the sixteenth century and flourished in the seventeenth in France, Germany, and England, the influence radiating from the court of Louis XIV. The greatest attention was here given to training in arms and horsemanship, both strongly advocated by Montaigne, but these exercises were supplemented by fencing and dancing. It will readily be noticed how the emphasis was once more shifted; the aim of physical training is now mainly or wholly to develop the social graces. It is clear from this brief account that the world to which John Locke addressed his *Thoughts on Education* (1693) was by no means unprepared for the recommendations he makes on the subject of physical training. But Locke, again, approached the matter from the disciplinary standpoint and emphasizes the importance of hardening the body; his is a return to the Roman practical view rather than the Greek æsthetic ideal; he knew from his own experience how valuable is the sound body as the servant of the sound mind. Rousseau in returning to nature follows much the same principles as Locke, and in laying stress in the *Emile* (1762) on the

value of making a healthy animal of the child before attempting his intellectual training he strikes the note that resounds throughout the following century.

In 1774, after all these centuries of theoretical approval, Basedow founded his *Philanthroponum*, a model school intended to embody his ideas of educational reform, and in this private institution at Dessau, open to all classes of society, bodily exercise was given a place in the daily programme from the start, incorporated into the plan of instruction as an essential factor, and intrusted to one of the regular teachers. Basedow had already spent eight years as professor of moral philosophy and belles-lettres in a school for young noblemen (*Ritterakademie*) at Sorø in Denmark, where, along with teachers of the literary branches, there were professional masters of riding, fencing, dancing, and other exercises. This attempt to combine physical with mental training in the case of youth of a certain class must have given direction to his thoughts, and the appearance of Rousseau's *Emile* doubtless confirmed him in his resolution. The first to be introduced into the new school were the knightly exercises, dancing, fencing, riding, and vaulting; then followed Greek gymnastics, apparently nothing more than systematic practice in running, wrestling, throwing, and jumping; and before the school was closed in 1793 most of the forms of activity advocated since that day had been employed, i.e., simple games and athletic sports, gymnastics, military drill, manual labor and manual training, and school excursions.

A long list of pioneers of the new art now appeared in various parts of Europe. Guts Muths taught gymnastics for nearly 50 years (1786-1835) in Salzmann's Educational Institute at Schnepfenthal and published important volumes on gymnastics, games, swimming, and manual training. Outside of Berlin, from 1810 through 1818, Jahn met boys and young men for exercise, beginning with a few pupils and a little portable apparatus, but later preparing and equipping an outdoor gymnasium and playground, and with the help of squad leaders handling a membership of more than 1000. Out of this voluntary association of turners developed 30 years later the popular gymnastic societies (*Turnvereine*) of Germany, which now number over 11,000 and have a total enrollment of more than 1,000,000 men. Franz Nachteggall, in Copenhagen, started a private gymnasium in 1799, the first institution in modern times devoted exclusively to physical training, and under his leadership Denmark became the first European state to introduce physical training into its schools as an integral part of the course and to prepare teachers of that subject by offering instruction in the theory and method of gymnastics. Under the patronage of the King of Sweden Ling opened in 1814 the Royal Central Institute of Gymnastics in Stockholm, and before his death in 1839 had laid the foundation of Swedish military, medical, and school gymnastics. The last branch was developed into its present form under his son Hjalmar in the third quarter of the century. The chief work of Adolf Spiess, the father of school gymnastics in Germany, was accomplished in the years 1833-55.

In the United States the different systems or sorts of physical training which have been brought forward for trial and the agencies

which have promoted its spread fall into three groups, centred about 1830, 1860, and the decade 1880-90. The first includes Capt. Alden Partridge and his military academies in Norwich (Vt.) and Middletown (Conn.); the introduction of the Jahn gymnastics and the opening of school, college, and city or public outdoor gymnasia under the direction of three German refugees, Charles Beck, Charles Follen, and Francis Lieber; the attempt to provide manual labor as a system of exercise in educational institutions; and the earliest use of calisthenics for girls and women, by Catherine Beecher in her schools in Hartford and Cincinnati. To the second belong the beginnings of college rowing and baseball; the building of the first college gymnasia, at Amherst, Harvard, and Yale, and the establishment of a chair of hygiene and physical education at Amherst; the "new gymnastics" of Dio Lewis; the incorporation of military drill and instruction in colleges and universities organized under the terms of the Morrill Land Bill of 1862; and our earliest acquaintance with the exercises of the Swedish Movement Cure (medical gymnastics). In the third group we find the system introduced by Dr. Sargent at Hemenway Gymnasium of Harvard University; the organization of the American Association for the Advancement of Physical Education (1885), the systematic efforts of German-American gymnastic societies and the North American Turnerbund to make their work known among native Americans, and the introduction of gymnastics into large city school systems by teachers trained in their normal schools; the starting of training courses for physical directors in Young Men's Christian Associations, first at Springfield, Mass., and later in Chicago, and the appointment of a secretary for that phase of Association activity by the International Committee, the Boston conference in the interest of physical training (1889), the introduction of Swedish school gymnastics into America, the opening of a number of normal schools and summer courses for the training of teachers; and the rapid spread of interest in athletic sports and active games.

Theory. Two contradictory views of the human body have at various times profoundly influenced the attitude of educators towards its care and training. One, which we may term the ascetic, reflects the dualistic philosophy of Oriental religions and finds expression in the practices of the Hindu fakir, the Christian saint of the desert, and the Mohammedan dervish. Since evil was believed to inhere in matter of whatever sort, while mind or spirit was essentially divine and pure, soul and body waged perpetual warfare on each other, and the ideal life was one of solitude, contemplation, and strict abstinence from sensual gratification in any form. Through the Alexandrian school of philosophy this tenet found its way into southern Europe very early in the Christian era, and, furthered by an inevitable reaction from the extreme luxury and self-indulgence which characterized the decadent pagan society of the Roman Empire and by the effects of persecution, which led to a glorification of martyrdom and caused pain and torment to be considered meritorious of themselves, it gave its impress to Christianity. Since mediæval education was almost wholly in the hands of the Church, the monastic discipline in all its severity came to

be regarded as a necessary part of the scholar's life.

According to the second view, the biologic or physiologic, the body is a machine with which man does his work in the world. Care and training are requisite in order that it may be perfect in all its parts at maturity and handled skillfully and economically. John Locke advises parents to "keep the body in strength and vigor, so that it may be able to obey and execute the orders of the mind," and Rousseau says that "a good servant ought to be robust. . . . The weaker the body, the more it commands; the stronger it is, the better it obeys." Huxley and Spencer, as might be expected, give fuller and more forcible expression to the same conception. Perhaps the strongest argument in favor of physical training to be drawn from the biological point of view is yielded by a study of the part which motor activity has played in the evolution of organs through the ascending scale of animal life. Professor Tyler, in his *Growth and Education*, presents it at some length. "The development of the heavy fundamental muscles," he concludes, "necessitated and stimulated the development of our vital organs, heart, lungs, and kidneys. These form a closely related group. Muscular exercise is still necessary for the development and maintenance of these organs in the individual man or child. They respond to muscular stimuli as they never do to those of the brain." The muscular system is also "the key to the development of the brain. . . . Nervous development followed the increase of locomotion and increased use of the sense organs, especially of the eyes. Arboreal life and the use of the hand were exceedingly important factors in the development of the cortex. . . . Mental exercise of a logical sort has added only the finishing touches to the development of the brain. It originated as a switchboard between sensory stimuli and muscular movement. It is still a part of the great neuromuscular system. Brain and muscle are never divorced in the action of healthy higher animals or of healthy men." In the case of the human being physical exertion has been an almost universal condition of existence down to recent times, and to it we largely owe our present type of body.

This view of the body as the servant of the mind, and the recognition of good health and motor activity as fundamental to sane and happy living, have led to the general introduction of courses in hygiene and the rudiments of human physiology into the curriculum of our schools and colleges, and to widespread attempts to supply facilities for bodily exercise, with more or less provision of expert oversight and systematic instruction. Such steps mark a noteworthy advance in the right direction, and yet they indicate only a partial grasp of the real significance and purpose of physical training, so called. For there is still a third view of the relation of body and mind, the psychophysic, which finds increasingly clear and forceful expression in the recent home and foreign literature of physical training, particularly that relating to playgrounds and athletic sports, and which suggests that hitherto we have barely crossed the threshold of opportunity and obligation. From the time of the Athenian philosophers down to the present day men have always realized, more or less consciously, that in some way or other the entire individual is reached through his

motor activities and is involved in them. Mind and body are interdependent, and what we have been calling physical training, if properly applied, may make direct and most important contributions to the intellectual, social, and moral progress of the child and youth.

As late as the middle of the last century it was still true that the farm, and in the town the home with its chores about house, barn, yard, and garden, provided for a large majority of the young a motor training that was in many respects ideal. But now, with an abruptness of transition that is fairly startling, the massing of population in cities and the substitution of machinery for human muscle have practically banished these factors in education from the lives of all but a few. The community, then, is confronted with a new problem, one which hitherto the family has for the most part been left to solve for itself. It must not only safeguard the bodily welfare of the child under the changed conditions and in a variety of ways undreamed of by our fathers; it must also take over the task of providing the growing boy and girl and the adolescent with an amount and kind of motor training which will be sufficient for his needs at every stage of growth and development. The gymnasium and the playground have become a necessary part of the educational plant, and the school is called upon to extend its curriculum and enlarge its powers in order to incorporate and control these educational agencies. Its task is a fourfold one: first, to conserve the health of the individual pupil and the group; second, to give instruction in the essentials of personal, domestic, and public hygiene; third, to provide systematic and progressive physical training throughout all but the earlier years; and fourth, to organize and supervise the activities of the playground and the athletic field.

Regarding the reasons for the third measure, and the manner of carrying it out, there is still a surprising confusion of ideas, even among men who have made a professional study of the subject and who occupy conspicuous positions of leadership. Play, games, athletic sports, and the various forms of dancing, although their value can hardly be exaggerated, are no more able to take the place of formal gymnastics than are the popular magazine, the picture show, and the public library to serve as substitutes for the orderly discipline of the school and college. There are drooping heads and shoulders, bowed backs, and flat chests which must be made to yield to carefully chosen corrective exercises. The rudiments of neuromuscular control must be acquired through frequent practice of varied forms of movement graded according to difficulty and advancing from the simple to the complex. The confinement of the classroom must be offset by vigorous use of the large, fundamental groups of muscles—those of the shoulders, trunk, and legs, whose contractions stimulate the activity of heart, lungs, and skin. The foundations of self-reliance, courage, and decision of character must be laid by means of exercises that call for the overcoming of some difficulty, or that present the element of danger involved in hanging and swinging by the arms and in jumping and vaulting over obstacles.

But the hour or so a day devoted to formal physical training is far from supplying all the motor activity required for the normal development of the child and youth. It is desir-

able that a still longer time be spent on the playground and athletic field. Here organization and supervision are again demanded, but only with the object of giving each individual a chance to play and of preventing the few from usurping facilities that all should enjoy. Freedom for self-expression and self-control, subject only to the rules of the game and the dictates of true sportsmanship, are the very essence of play. Social and moral training are chief among its benefits, and the teacher's business is to suggest and lead, not to dictate or compel.

Practice. For 50 years or more systematic physical training has formed a regular part of primary and secondary education in most Continental countries, and in Denmark and Sweden the beginnings date back a full century. In the United States, on the contrary, the movement to incorporate such discipline in the school system is still in its infancy. The first serious attempts on any large scale, if we omit a few sporadic cases, fall in the second half of the decade 1880-90, and we cannot be said to have advanced as yet beyond the experimental stage. American colleges and universities, however, have generally taken the step, and in them physical training has reached its highest point of development in America, although the measures adopted leave much to be desired. It is evident, then, that a study of the chief European types or systems is the necessary starting point in any discussion of practice. These can all be reduced to four elemental forms—the German popular gymnastic society (*Turnverein*), German school gymnastics, Swedish school gymnastics, and the games and sports of the English public schools and universities. The first named, which has been widely copied in other countries, affects directly adults and older youths only and therefore lies outside the main purpose of the present article.

It is difficult to characterize the German system in a few words, for in the absence of an Imperial bureau of education each of the 26 states manages its own school affairs independently, and numerous differences of detail exist. To the English or American visitor the most striking fact is the universal inclusion of gymnastics as a part of the curriculum in elementary and secondary schools alike and the provision of fully equipped indoor and outdoor gymnasia, at least in the case of the larger cities. Instruction in the elementary schools is given by the regular grade teacher, whose preparation in this, as in all other subjects, is received in some one of the many state or private training colleges. Official or semiofficial manuals have been published in some states for the guidance of such teachers, and there are city, provincial, and state officers charged with the duty of supervision and inspection. In the secondary schools instruction is in the hands of a member of the staff who teaches some other branch or branches as well (the *Auch-Turnlehrer*), or it is intrusted to a professional teacher of gymnastics (the *Nur-Turnlehrer*). Whichever plan is followed, the instructor must have passed a special state examination, or completed a course at one of the five state normal schools of gymnastics (*Turnlehrerbildungsanstalten* or *Landesturnanstalten*). These latter are located at Spandau, Dresden, Munich, Stuttgart, and Karlsruhe, and the length of the course varies all the way from a few weeks (Karlsruhe) up to two years (Munich). Re-

cently courses in the theory and practice of physical education have been introduced in each of the 10 Prussian universities, and in at least three others (Heidelberg, Jena, and Leipzig). Thus the student is enabled to prepare for the state examination, and in most cases to take it, at the university where he is pursuing other studies. The time allotted to gymnastics is three one-hour periods a week in Prussian secondary schools. Some of the remaining states require the same number, and others provide for two lessons only. Each lesson usually begins with class exercises in marching, or with exercises performed either with no apparatus at all or with only a wand or a pair of dumbbells in the hands, and then the class is divided into squads for work at two different pieces or sorts of apparatus—one permitting hanging and climbing exercises and the other jumping and vaulting. Nowadays it is becoming customary to substitute a throwing or running game, or some simple athletic event, for one set of exercises on apparatus.

The Swedish system of school gymnastics, as practiced in its native country, presents a number of distinguishing features. Each teacher in the elementary schools is expected to give the gymnastic lesson to his (or her) own pupils, unless the city provides special teachers, and as in Germany the requisite preparation is given in the various state and private training colleges. These colleges, and every secondary school in Sweden, must have on the staff a professional teacher of gymnastics who has completed a two-year course at the Royal Central Institute of Gymnastics in Stockholm. Hitherto the physical training in boys' schools has been almost altogether in the hands of officers in the army and navy, and they far exceed the civilians among male students in the Central Institute. Except for the general absence of hand apparatus, the Swedish school gymnasium usually possesses quite as complete and varied an equipment as will be found in any other country. Its most peculiar features are the stall bars, long double horizontal bars, and a sort of lattice ladder. The law requires three hours of instruction in gymnastics each week throughout the entire course in secondary schools, and this may be given in daily half-hour periods or in longer ones at less frequent intervals. Lessons conform more or less closely to the so-called "day's order." This is based on a careful selection of types of exercise made with certain specific needs of the pupil in mind, a grouping of the exercises not by the apparatus employed but according to the effects they produce, and a sequence of these groups intended to secure a maximum of result with a minimum expenditure of time and effort.

Quite unlike the formal training of the German and Swedish schools are the outdoor games and sports which long formed a distinctive feature of the English public schools, such as Eton, Harrow, Rugby, and Winchester, and the older universities. In these schools was developed primarily the formation of character as the aim of education, based largely on the development of initiative and independence in social and physical activities outside the classroom. This ideal was early adopted by the older grammar schools and until recently was associated almost wholly with secondary education. Within the last few years this ideal has begun to spread and to be adopted gradually but surely in the elementary

schools as well. Ample playgrounds are considered a necessary provision of most secondary schools and are required by the Board of Education regulations in elementary schools. In both grades of schools playing fields, if not accessible close to the school, are rented outside. In the boarding schools and those which more closely imitate the character of the older public schools regular participation in some variety of outdoor exercise is practically compulsory for every one who is not excused for medical reasons. In the day secondary schools, where the pupils live at a distance from the schools, this compulsion is of course impossible, but even under these circumstances it will be found that a good proportion participates. In the elementary schools the Board of Education since 1906 recognizes the introduction of organized games as part of the curriculum, and one morning or one afternoon each week may be devoted to them as part of the regular work, while there is, of course, no restriction on voluntary games after school hours. The usual practice in the case of elementary schools is to make use of the public parks. In the secondary schools sports and athletics are managed by the pupils themselves, always with the encouragement of several teachers. Interclass, interhouse (in the case of boarding schools), and interschool contests afford ample opportunities for competition and exercise in addition to the ordinary practice. In the elementary schools interscholastic leagues are found everywhere, and in a few cases intercity school athletic leagues have been formed. Football (both Rugby and Association), cricket, hockey, and lacrosse, and for girls hockey and basketball, are the games most frequently found. Rowing has been developed in the older public schools and a few secondary schools. The same interest and devotion to sports and athletics prevail at all the universities, where the numbers participating are sufficiently large to permit of the organization of several teams for each game. At Oxford and Cambridge the different colleges also serve as units for rivalry, while the newer universities play against each other and against first-class local teams. Since the masters of the secondary schools are not infrequently appointed for their interest in athletics as much as for scholarship, it will be readily seen how the national ideal is kept alive and fostered throughout the country.

As might be expected, these three types of physical training, arising independently, have begun to react upon each other and have been copied in more or less modified and composite form by the educational authorities of other countries. Books on education in England published by Paschal Grousset and Baron Pierre de Coubertin in the decade 1880-90 exerted a profound influence on French thought and directed attention to the great importance of vigorous open-air exercise. Since 1891 Germany has had a Central Committee for Promoting Active Games and Athletic Sports, which has conducted a well-organized and successful campaign. The Scandinavian countries have been similarly affected, and there are corresponding societies in both Norway and Sweden. On the other hand, the spread of the Swedish system of school gymnastics in the last few decades has been equally noteworthy. It has won the attention and modified the practice of German and Swiss teachers, made considerable

headway in France and Belgium, and almost entirely replaced the older *Nachtegall* gymnastics in Denmark. England has been slow to adopt formal training, but now the army and navy manuals and the *Syllabus* of the Board of Education, prescribed for elementary schools, are based upon the Swedish system. It has also been introduced as a general requirement at Eton and Rugby, to supplement the effects of outdoor sports, and most of the large secondary schools now have well-equipped gymnasia.

In the United States, wherever physical training has been made a part of the public-school curriculum it has usually followed either the German or the Swedish type, but too often without the equipment which would be considered indispensable in other countries. The colleges and universities, as a rule, possess fairly adequate gymnasia and organized departments of physical education in charge of regular members of the faculty, who are more commonly graduates in medicine. Most of these institutions provide and require a year or more of systematic exercise, and it is the growing practice to grade the student for this as for other courses and to include the credit given for it in the total number of hours necessary for graduation. The director of the gymnasium is often the instructor in hygiene also, and in a majority of cases he stands in some official relation to the different athletic teams. Each student upon entering the institution receives a medical examination and is variously measured and tested, to determine his physical condition and to yield data with which the results of later examinations may be compared. The amount of time given to formal gymnastics and the methods pursued in teaching differ widely. Professional preparation for the work of physical education is still very largely acquired in special privately owned normal schools or in summer courses. The Young Men's Christian Association supports two training schools, in Springfield (Mass.) and Chicago, and the North American Turnerbund conducts a Normal College in Indianapolis. Here and there State normal schools and endowed teachers' colleges provide training in this subject. Most significant is the fact that an increasing number of universities and colleges now offer more or less extensive teachers' courses in physical education, counting towards the bachelor's degree.

Bibliography. For the history: F. E. Leonard, *Pioneers of Modern Physical Training* (2d ed., New York, 1915), also a guide to the literature. For the study of theory: Konrad Koch, *Die Erziehung zum Mute durch Turnen, Spiel und Sport* (Berlin, 1900); Hough, "A Review of Swedish Gymnastics," in *Report of the Commissioner of Education, 1898-99*, vol. i (Washington, 1900); L. H. Gulick, *Physical Education by Muscular Exercise* (Philadelphia, 1904); D. A. Sargent, *Physical Education* (Boston, 1906); J. M. Tyler, *Growth and Education* (ib., 1907); also the *Proceedings of the American Association for the Advancement of Physical Education* (10 vols., 1885-95), and the *American Physical Education Review* (begun in 1896, now published in Springfield, Mass.). For practice: consult the bibliography under GYMNASIUMS, which contains a list of the most important manuals and handbooks.

PHYSICAL FORCE PARTY. In British politics, the term frequently applied to the

party of Young Ireland which advocated physical force as against constitutional agitation to free Ireland from English oppression. It was most active at the close of the eighteenth century under the leadership of Tone and Emmet, in the middle of the nineteenth century under Mitchel, when the name was most frequently applied, and again, under the name of Fenianism, in 1858, 1865, and 1867.

PHYSICAL GEOGRAPHY. See GEOGRAPHY; PHYSIOGRAPHY.

PHYSICAL OPTICS. See LIGHT.

PHYSICAL SOCIETY, AMERICAN. A learned society organized for the advancement and diffusion of the knowledge of physics. It is one of the affiliated societies meeting with the American Association for the Advancement of Science. It also holds four meetings a year for the reading and discussion of papers upon the subject of physics.

PHYSICAL SOCIETY OF EDINBURGH, ROYAL. A learned organization of Scotland, instituted in 1771 and incorporated by royal charter in 1788. Its object is the "promotion of zoölogy and other branches of natural history," including anthropology, paleontology, and evolutionary theory. Discussions take place at monthly meetings held in the Philosophical Institution, Edinburgh, where the society possesses a large and valuable reference library. The membership is divided into three classes—fellows, corresponding fellows, and honorary fellows, the number of the last named being limited to 15. For over a century the society did not print its transactions, but now publishes an annual volume of *Proceedings*, the first volume having been issued in 1854-56. This is one of the most important zoological journals published.

PHYSICAL SOCIETY OF LONDON, THE. A learned society, founded in 1874, with its office and reference library in the Physical Laboratory of the South Kensington Museum, which has since transferred its official headquarters to Burlington House, London. Its object is to promote the advancement and diffusion of a knowledge of physics and for that purpose to have papers read, new apparatus shown, and experiments tried at its meetings, which it holds fortnightly. The society publishes *Proceedings*, which are issued quarterly and contain the more important papers read at the meetings as well as the official records of the society.

PHYSICIAN (OF. *physicien*, *fiscien*, from Lat. *physicus*, from Gk. *φυσικός*, *physikos*, natural philosopher, physician, from *φύσις*, *physis*, nature, from *φύειν*, *phyein*, to produce). In law, one who is entitled to practice medicine or surgery. Specifically one who has complied with all State regulations in regard to the study of medicine and who may lawfully practice the healing art. Most States require a medical student to pass a State examination satisfactorily and thereupon grant a license to practice to successful candidates. It has been held that such statutory restrictions are justified in the public interest and are not an improper interference with the liberty or property of the persons affected thereby. A person who holds himself out as a physician is considered to represent that he has the ordinary skill of one of his profession. Lack of skill or negligence on the part of a physician, resulting in injury to a patient, is called malpractice (q.v.) and sub-

jects the practitioner to an action for the damages sustained. The practice of medicine is not, however, a public calling, and it is therefore optional with a physician whether or not he will attend a person calling him.

The relation of a physician and patient is a confidential one, and the former is bound not to divulge any of the secrets confided to him by the patient, even on the witness stand. The statutes of each State in regard to the practice of medicine should be consulted. See EVIDENCE; MAJ PRACTICE.

PHYSICK, fiz'k, PHILIP SYNG (1768-1837). An American physician, born in Philadelphia and educated at the Friends' Academy. In 1788 he went to Europe, studied with John Hunter, and was admitted to St George's Hospital in 1790. In the same year he received a diploma from the Royal College of Surgeons and assisted Dr. Hunter for one year. In 1792, after attending one session, he received his degree from the University of Edinburgh. Returning to Philadelphia in 1793, he was appointed physician at several hospitals and in 1805 became professor of surgery in the University of Pennsylvania. In 1819 he was called to the chair of anatomy, which he filled until 1831. Physick introduced the use of absorbable kid ligatures, performed an operation for artificial anus, invented a tonsillotome, etc.

PHYSIC NUT (*Jatropha*). A genus of about 70 species of tropical shrubs and trees of the family Euphorbiaceæ, characterized by alternate, stalked, angled, or lobed leaves, corymbs of flowers on long stalks, and the acrid oil of their seeds. The common physic nut (*Jatropha curcas*) of the East Indies, introduced into the West Indies, southern Florida, and other warm parts of the world, is a small, much branched,

PHYSIC NUT

rapidly growing tree or bush with a milky juice. It is used for fences in many tropical countries. The expressed oil, commonly called jatropha oil, is used for illuminating purposes and has been used in medicine. The French or Spanish physic nut (*Jatropha multifida*), an American shrub with many-lobed leaves, yields an acrid oil, called oil of pinhoen. To this genus belongs the pinoncillo (*Jatropha lobata*) of Peru, the roasted seed of which is an agreeably flavored food. Incisions in the stem of

this tree allow the escape of a clear, bright, powerfully caustic liquid which after some time becomes black and horny and retains this property for years. Physic nettle (*Jatropha urens*), a native of the southern United States, has similar qualities.

PHYSICS (from Gk. φυσικά, *physika*, nom. pl. neut. of φυσικός, *physikos*, relating to nature). Physics is one of the successors of the study formerly called natural philosophy, or the science of the phenomena of nature as revealed to us by our senses and as interpreted and systematized by our intellects. The name itself is the plural of the word "physic," which was used as early as the fourteenth century to mean natural philosophy, but which afterward became restricted to mean the science of medicine and finally to mean a medicine or drug itself. While physics in its modern sense comes closely in contact with chemistry, astronomy, and many other sciences, it is impossible to state in words its exact scope. It may be said, however, in general that the study of physics includes the phenomena of acoustics, of heat, of light, of electricity and magnetism, and of mechanics to a certain extent. There are two great divisions of physical methods: one may be called the laboratory method, the other the method of mathematical physics. (See LABORATORY.) The laboratory method consists, first, in making a series of observations and amassing information in regard to phenomena, but further in seeking to obtain a generalization with which the observed phenomena may be in accord. The fundamental method of mathematical physics is to devise certain postulates and to state such axioms as will lead by rigid mathematical processes to formulæ which may be compared with observed phenomena. Thus, by means of the methods of logic, conclusions may be drawn connecting many phenomena which on their face are unrelated.

History. It is remarkable to note how few facts other than obvious ones were known to the ancients in regard to nature and also to find how few instruments were available for what may be called scientific observation. Beyond a doubt simple forms of instruments were known for the measurement of time, such as water clocks, sundials, etc., and the Chinese at least had a knowledge of some of the simple properties of a magnet. The law of the reflection of light was generally known, and lenses were in use for various purposes. The law of the lever was known to Archimedes, as were also certain of the laws of hydrostatics. There was a knowledge of harmony in music more or less incomplete. A few observations are also noted in regard to electric attraction and the facts of meteorology.

Up to the Middle Ages there are few if any facts to be recorded in regard to the growth of natural philosophy, because the Romans were content with the knowledge left them by the Greeks, and the intellectual activity of the Arabs seemed to be concentrated, as far as physics is concerned, in the person of Alhazen, who was interested largely in optics. There was a revival of interest in nature during the thirteenth century, as shown by the work of Roger Bacon and Peregrinus. In the sixteenth century Copernicus lived, and he was followed by Galileo, Kepler, Stevin, Gilbert, and others. Galileo's greatest contribution to physics was the statement of the principles of mechanics.

He was succeeded by pupils whose interest and influence were so great that they led to the establishment of academies and learned societies throughout Europe. With the appearance, however, of Huygens's *Horologium Oscillatorium* (1673) and Newton's *Principia* (1687) physics came to the front as the most important of the sciences. The methods used by these two men, both in their observations and in their statement of laws of nature, have served as the models for succeeding generations. They were followed by two schools—one interested in the mathematical development of mechanics, the other interested in the purely experimental side of the subject—whose legitimate predecessors were Torricelli, Pascal, Boyle, and Guericke.

Modern Times. The development of our present knowledge of physics is more fully described under the separate headings of its various subjects, viz., ACOUSTICS, HEAT, LIGHT, ELECTRICITY, and MAGNETISM. It should be sufficient in this place to refer to a few names in connection with each of the subjects. Our accepted ideas in regard to the nature of heat and heat effects are due to the researches and theories of Black, Rumford, Davy, Carnot, Clausius, and Joule. In light we owe most to Young, Fresnel, Fraunhofer, Kirchhoff, and Stokes. In the subjects of electricity and magnetism a long list of names should be mentioned, but among these those of Volta, Cavendish, Ampère, Oersted, Faraday, Henry, Gauss, Weber, Maxwell, and Kelvin are easily the most notable. To Helmholtz alone, it is only fair to say, all of our accepted ideas of the theory of sound are due. The names of no living men have been included in the above summary, but any such list would be incomplete without the addition of the names of Rayleigh, Lorentz, J. J. Thomson, Larmor, and Rutherford, who have contributed so much to the most recent ideas in regard to the fundamental concepts of nature.

Previous to the nineteenth century there were three great principles of physics which were firmly established and which deserve to be called laws of nature. These were the law of gravitation, the principle of the conservation of matter, and that of the conservation of momentum. The most notable fact in the history of physics during the nineteenth century was the development of the principle of the conservation of energy and its application to all fields of science. This great development was due largely to the efforts of J. R. Mayer, Helmholtz, and Joule. Other great principles, such as the second law of thermodynamics, were expressed in words and will be found discussed in other places. The kinetic theory of matter was also elaborated and established on a firm basis.

Beginning with the discovery of the X rays by Röntgen in 1895 and of the radiation from uranium by H. Becquerel in 1896, there has been a progress in physics and in our knowledge of the properties of matter which has been one of the most striking facts in the whole history of science. The point of departure in our new knowledge comes from the epoch-making discovery by J. J. Thomson that in their passage through air both the X rays and those from uranium make the air a conductor for electric currents. This discovery led at once to investigations by observers the world over in regard to the nature of the ionization of air and of the radiations which produce it. It was soon found that many substances other than uranium had

this same power of emitting radiations which would ionize a gas; such were thorium and the newly discovered elements, radium and polonium. These substances are said to be radioactive. (See RADIOACTIVITY.) The properties of the radiations themselves were carefully studied and analyzed, and their properties other than that of ionization were investigated. There are always present in the radiations from such bodies both positively and negatively charged particles of matter, whose velocities vary within wide limits. When the velocities of the negatively charged particles as produced in various ways were studied, a most remarkable fact was observed. Attention had been called many years ago by J. J. Thomson to the fact that if a charged sphere were moving rapidly it would have an effective inertia greater than that which would be observed in case it were uncharged. In other words, an electrical charge in motion has an apparent mass quite apart from that of the matter carrying it, and formulas have been deduced by Thomson, Lorentz, and Abraham connecting this mass of the charge with the quantity of charge and its velocity. It was observed in the case of the negatively charged radiations above referred to that their apparent mass was exactly that which would be calculated from the formulae on the assumption that the mass was due entirely to the moving charge. This discovery renewed at once the theories of matter which had been advanced before, in accordance with which the inertia of matter is a property due to the motion of an electric charge. The name "electron" has been given these charges when considered apart from matter, and a most interesting discussion of their properties and of the theories of matter based upon these is given in a series of papers by Sir Oliver Lodge in the *Electrician* (London) during the winter of 1902-03.

One of the great contributions of the nineteenth century to physics was the development of the idea of the luminiferous ether. The necessity of a medium for the transmission of the waves which produce the sensation of light had been recognized for many years and was clearly stated by Fresnel and others. Faraday had also come to the conclusion that a medium was necessary for the transmission, or rather existence, of electric and magnetic forces and had suggested that possibly this medium might be identical with the one that carried "light waves." Maxwell showed by theoretical considerations that the velocity with which an electromagnetic disturbance would be propagated in the medium referred to by Faraday must be numerically equal to the so-called "ratio of the electrical units" and further showed from experimental evidence that this was equal to the number expressing the velocity of light. He also proved by a mathematical investigation that the electromagnetic waves were identical in all respects with those with which we are familiar in the phenomena of light and thus established the fact that only one medium is necessary for the explanation of the phenomena of light, electricity, and magnetism. The connection between this ether and ordinary matter has been investigated by many observers, as described in the article on ETHER. The accepted theory at the present time is that the ether does not move as material bodies are carried through it, and this, in connection with the ideas of electrons, has been elaborated by Lorentz into a theory

which is able to explain in the most satisfactory manner the phenomena of dispersion, metallic reflection, and stellar aberration. There are many difficulties, however, which still remain to be investigated in regard to the properties of the ether, in spite of the great progress marking the beginning of the twentieth century. It is only fair to note that there is a school of mathematical physicists who in stating the laws of nature do not make any assumptions as to the existence of the ether. See RELATIVITY.

PHYSIOCRATS, fiz'î-ô-kräts (from Gk. φύσις, *physis*, nature + κρᾶειν, *kratein*, to rule). A French school of political and economic philosophers, known to their own generation as *Les Economistes*, who wrote against the antiquated methods of the state in encouraging industry (see COLBERT), and in favor of agriculture, industrial freedom, and natural liberty. The school flourished from 1756 to 1776. The founder and leader of the school was François Quesnay (q.v.), a noted surgeon, metaphysician, and, after 1749, physician to Madame de Pompadour. With Quesnay is often associated in the founding of the sect the name of Jacques Claude Marie Vincent de Gournay (q.v.), who did not, however, indorse the extreme views of the school respecting the paramount economic importance of agriculture. The most earnest disciples and indefatigable propagators of the physiocratic doctrine were the elder Mirabeau, Mercier de la Rivière (1720-94), and Dupont de Nemours (q.v.), editor of the works of Quesnay and Turgot and of the physiocratic journals. Among the statesmen, rulers, and princes of the

time who accepted the main doctrines of the physiocrats were, first and most important, Turgot (q.v.), Minister of Finance under Louis XVI; Charles Frederick, Margrave of Baden; Gustavus III of Sweden; Leopold II, Grand Duke of Tuscany, and afterward German Emperor; Stanislas of Poland; the Emperor Joseph II; and Charles III of Spain. With some of them the acceptance was little more than half-hearted, and the only monarch who made an earnest attempt to carry out their programme of reform was Charles Frederick of Baden. He tried to apply their principles in three villages, but finally abandoned the attempt.

The general doctrine of the physiocrats was an extension to the economic sphere of the theory of natural liberty which Locke, Hutcheson, Shaftesbury, and others had applied to the sphere of politics and religion; but, unlike the British philosophers, the physiocrats denied that the natural rights of the individual could be abridged by any social contract. Every man, they held, has a right to the free exercise of his faculties so long as he does not infringe the like liberty of others, and this involves the further right to the undisturbed enjoyment of the property which results from the exercise of his faculties in productive labor. It follows from these rights that the sole function of government is to protect life and property and to administer justice, and no interference by the government with commerce and industry is permissible—in the classic phrase of the school, *laissez faire, laissez passer* (q.v.)—but within the restricted sphere noted above the physiocrats advocated a strong monarchical government, a "legal despotism, tempered only by an enlightened public opinion."

The peculiar economic views of the physiocrats seem to rest upon a confusion of wealth with material objects, leading to the conclusions that agriculture alone yields a surplus product—*produit net*—above the expenses of production; while manufactures and commerce, which merely change the form or position of raw materials, are barren. As agriculture is the only form of production yielding a value in excess of the cost of production, they advocated that taxes should be levied upon rent—which expresses or measures the "net product"—so as to avoid the expense and friction attendant upon the shifting of the tax to this source when placed originally upon other objects. They thus gave to political economy the fruitful theories of surplus value and the single tax, *impôt unique*. (See POLITICAL ECONOMY.) The scientific virtues and defects of the physiocrats may be traced to one and the same cause, the belief in a beneficent and absolute natural law governing the moral and social universe with the same rigidity and precision as the material universe is governed by physical law. This belief made them at once narrow but precise, systematic but unmindful of the difference between physical and psychical phenomena, careful in definition, distinction, and classification but careless of the effects of customs, law, and the diversity of human motives. They have exercised a deep and lasting influence upon political economy. Opinions differ regarding their influence upon the practical affairs of the day. They undoubtedly stimulated the study of agriculture, suggested several important agricultural improvements, called attention to the oppression of the peasantry and elevated their importance in the eyes of the nation, and secured

a freer intercourse of trade, particularly in breadstuffs, within the French Kingdom. In the early years of the French Revolution their doctrines exercised an appreciable effect upon the Constituent Assembly, but their most striking practical influence was exercised through Turgot (q.v.), who, while not a professed physiocrat, made many earnest attempts, both as Intendant of Limoges (1761-74) and as Comptroller General of Finance (1774-76), to abolish the *corvées* and the guilds, to introduce free trade in corn, to reduce taxation, and to accomplish the general reforms which the physiocrats demanded.

Among the most important publications of the physiocrats are Quesnay's articles on *Fermiers* and *Grains*, published in the *Encyclopédie* of Diderot and D'Alembert; *Le droit naturel*, published with other of his writings in the *Physiocratie* (which gave the school its name), edited by Dupont de Nemours; and his *Tableau économique* (1758), "the Bible of the Physiocrats," reprinted for the British Economic Association (London, 1894); Mirabeau's *Théorie de l'impôt* (1760) and *Philosophie rurale* (1763); Dupont de Nemours's *De l'origine et de progrès d'une science nouvelle* (1767, published in his *Physiocratie*); Mercier de la Rivière's *L'Order naturel et essentiel des sociétés politiques* (1767); Turgot's *Réflexions sur la formation et la distribution des richesses* (1770).

PHYSIOGNOMY (Fr. *physionomie*, from Gk. *φυσιογνωμία*, *physiognōmía*, art of judging by the features, from *φύσις*, *physis*, nature + *γνώμων*, *gnōmōn*, judge). See **PHRENOLOGY**.

PHYSIOGRAPHY (from Gk. *φύσις*, *physis*, nature + *-γραφία*, *-graphia*, description, from *γράφειν*, *graphein*, to write). There is much difference in the usage of the term "physiography." It is employed as a synonym for the older term "physical geography"; as a term to include a general introduction to science; for the study of the physical environment of life; and for the study of land forms alone, i.e., as a synonym for the name "geomorphology," proposed some time ago. In the United States the term "physiography" is rapidly coming to replace the older term "physical geography," at the same time that a more scientific basis is being introduced into physical geography. In this sense physiography is concerned with the study of air, ocean, and land, with the object of understanding their present condition and influence on life. To understand present conditions leads back into meteorology, oceanography, and geology; to appreciate their influence on life presupposes at least knowledge of history and biology. It is no uncommon belief that physiography is too complex and draws upon too many other subjects to have distinct boundaries and hence to deserve the name "science." It is true that there is no general agreement as to the exact boundaries, but this is by no means proof that physiography can have no boundary. Some one has said that geology is a study of the past. That is to say,

a geologist, to appreciate his subject fully, must have knowledge as a physiographer; and a physiographer must know the past that he may use geology as a tool in his attempt to understand the present.

Astronomical Aspects. The study of physiography deals essentially with the earth—its spherical form, its envelopes of air and water, its cold crust and heated interior, and their influence on life. Yet no thorough appreciation of these conditions and influences is possible without a general knowledge of the astronomical relations of the earth. The earth as a sphere and as a member of the solar system in which it so moves as to give day and night and the seasons are facts of fundamental importance to an understanding of changes in the earth; and the spherical form of the earth and the presence of heat among the members of the solar system furnish adequate reason for a consideration of the hypotheses for the origin of the earth. This does not mean that the subject encroaches on astronomy; it is dealing with the earth, but it inquires of astronomy the reasons for terrestrial phenomena of vital importance and applies these to an interpretation of the phenomena in their relation to life.

Air. The influence of the air on life is universal. Its oxygen and carbon dioxide; the influence of its pressure; the effects of its density, e.g., on the flight of birds; its water vapor; its winds and their effects—these are among the many reasons why a study of the air properly forms a part of physiography. The science of meteorology furnishes the explanations, and with these the physiographer needs to be familiar. In order that he may understand the distribution of life he should know why there is vapor, why winds blow as they do, why there are rainy and desert regions, and why there are storms. The branch of physiography that deals especially with this phase of the subject is climatology. If the climatologist studies only the causes of climate, he becomes a meteorologist; but if his especial concern is the understanding of the laws of climate with reference to their influence on life, he is a physiographer. The study of the air has a bearing on other phases of physiography. Waves and ocean currents depend on air conditions, and to understand them calls for a knowledge of air movements. Rain, river floods, the difference between the topography of arid and moist lands, and the existence of glaciers are among the features of the land that depend upon a knowledge of the air for their proper appreciation. Each of these reacts on life. Thus, along several lines, it is evident that there is a phase of air study, calling for an appreciation of the science of meteorology, it is true, but with its main object the investigation of the influence of the air on the environment of plant, animal, and human life.

Ocean. The temperature and movements of the ocean, dependent upon sun's heat and air movements; the tides, dependent on the attraction of the sun and moon; the composition of the ocean water, its depth, and the characteristics of the ocean bottom—are among the important physiographic features of the ocean. Each of these has an influence on life. The ocean supplies vapor to the air; its vast expanse and its currents influence the temperature of the air and aid in those movements of the air by which the temperature and rainfall of the lands are profoundly affected. Life in the ocean as in-

fluenced by its environment, the effect of ocean influence on the life of the lands, the ocean as a barrier to the spread of life, and its importance to man in commerce and many other ways are among the subjects with which a physiographic study of the ocean is concerned. The oceans and the lands are profoundly interrelated. The waste of the land is carried to the sea by rain and rivers, and the oceanic agents are attacking the land along its border, forming many varied coast features. Changes in level of the crust lower parts of the land beneath the sea and raise sea bottoms to form dry land. No study of the lands can promise the best results without a knowledge and appreciation of the conditions of the coast line and sea bottom. From this it is evident that the physiographic study of the ocean is broadly interrelated with the study of the land and air. The science of the study of the ocean is called oceanography; and, as in the case of meteorology, while the physiographer must understand the principles, his concern is far less with the science of oceanography than with the application of its principles to an understanding of their influence on life.

Lands. There is a conflict of forces at the present time operating to modify the forms of the lands which themselves so greatly influence life. On the one hand, contraction of the interior of the earth is causing changes in the level of the crust as a result of which continents are raised and ocean bottoms depressed, while mountain chains, volcanoes, plateaus, and plains are being made. On the other hand, opposing forces are at work on the land removing the rocks that lie above the sea level and dragging the fragments into the sea. The weather disintegrates the rocks; the rains, rivers, and winds remove the fragments. Glaciers occasionally aid in this erosion, and the seacoast is the seat of further important work of this kind. The result of the opposing forces of elevation and destruction has been to produce a very complex land surface, and it is one of the most important provinces of physiography to understand this land surface and to point out its effect on life. For this phase of physiography the name "geomorphology" has been proposed. It is intimately related to geology and makes use of geological principles. It is by some considered as a branch of geology, i.e., the geology of the present.

Many of the principles relating to the physiography of the lands are stated under other topics. (See RIVER; LAKE; MOUNTAIN; ETC.) In this place only the scope of the subject will be indicated. The simplest land form is the plain (q.v.), the most extensive and perfect plains being on the sea bottom. They may be classified as constructional and destructional—the former being represented by elevated sea-bottom plains, lake-bottom plains, delta plains, flood plains, etc., the latter by plains of marine denudation, plains caused by lateral erosion of rivers, etc. In the beginning their surfaces are level, they permit the ready spread of animals and plants, and, if the climate favors, they are usually well suited to occupation by man. If newly formed, or young, the surface may be so level that water stands on it as lakes or swamps; but with increasing age the surface is drained, streams cut valleys, the flat-topped divides are narrowed, and the lakes and swamps are destroyed. In the development of these stream valleys, if the plain stands high enough above sea level, or base level, the rapid cutting along

the channels permits the development of deep, steep-sided valleys. In these young valleys the vigorously working streams flow with rapid slope, and with occasional falls where hard layers are encountered. If the land is high above base level, i.e., if it is a plateau, the young streams may so trench the land that travel across country is prohibited by the deep cañons. In such cases the interstream areas only are habitable and are chosen for roads and railways. With time the valleys broaden, the slopes become more gentle, and both the valley bottoms and sides invite settlement. Such a land surface is mature and is well illustrated by the Mississippi valley. There are few if any falls, the rivers are navigable, and they are bordered by flood plains—waste from the land along the course which the river is unable to bear to the sea over its gentle lower slope.

The Alps as a barrier to the spread of life and as a refuge from invasion stand as rugged mountains reaching above the snow line. Their ruggedness is due to their youth and to the fact that denudation, working high above base level, on rocks of very different degrees of hardness, has been able to work rapidly and scar and carve the mountains profoundly. With greater age mountain peaks and ridges are lowered, the valleys are broadened, and the rivers slowly shift position, eating their way backward at the headwaters, robbing weaker opponents of drainage area, and pushing their way across ridge after ridge, as in the Appalachians. The importance of the river gaps to transportation and the influence of mountains on occupation are observable throughout the world.

Rising land gives a straight coast, as along western South America; sinking forms an irregular coast, with many islands, peninsulas, harbors, and straits, as in the northeastern United States. A shelving coast of soft materials which has recently assumed its position is skirted by sand bars, like the coast south of New York, while a young coast of hard rock has bold headlands, with beaches in the bays. Here, again, are innumerable opportunities to study land forms in order to understand their cause and point out their influence on life.

The physiography of the lands investigates islands, peninsulas, capes, plains, plateaus, and valleys, it studies their differences in form; it distinguishes between the different kinds of hills, cliffs, talus slopes, etc. In fact, it studies all land features, and in all cases it is concerned with the form, its cause, its relation to other land forms, and its effects on life. It shows how in their conflict the movements of the crust and the operation of the agents of denudation make land forms by constructional and by destructional processes. It shows that there is a constant building up of land forms by both the internal forces of elevation and the external forces of denudation and that there is constant tearing down by the forces of denudation. It is the province of physiography to trace the operation of these processes, both to see how they modify the lands and to discover the influences of these modifications on life. See GEOGRAPHY; GEOLOGY.

PHYSIOLOGICAL SELECTION. A theoretical explanation proposed by Romanes of the evolution of species on the principle of the prevention of intercrossing. Hence Romanes also referred to the assumed law as that of the "segregation of the fit." He was led to his generalization by consideration of the facts of sterility between species and of fertility between varieties and races. Basing upon observation the postulate that the reproductive system was the most susceptible to change of any part of an animal's organization, he argued that in that system would often (perhaps more often than in any other) arise independent variations in individuals. If these were of such a character as to tend towards sterility between them and parent forms, they would tend to separate the variety from the species and a new species would evolve. Romanes concluded that the principle of sterility between species was essential to the separate existence of species.

PHYSIOLOGY (Lat. *physiologia*, from Gk. *φυσιολογία*, natural philosophy, from *φυσιολόγος*, *physiologos*, discoursing on nature, natural philosopher, from *φύσις*, *physis*, nature + *λόγος*, *logos*, word, account, ratio, from *λέγειν*, *legein*, to say). Under the term "physiology," when used in its widest sense, we include all that is known of the properties of living matter. Following the great line of demarcation of living things into animals and plants, we have an animal physiology and a plant physiology. The two subjects, while closely related, are sufficiently different to be considered as separate sciences and to require specialists of different training for their study. In animal physiology we have to deal especially with the properties of animal protoplasm, and although the fundamental properties of this material are believed to be much the same in all animals, yet for each animal or group of animals there are minor distinctions which are due in part to fundamental differences in structure and in part to the variety in the physiological mechanisms developed in different animals. In what follows an attempt will be made to present briefly an outline of the important facts and principles of human physiology, but it should be remembered that the body of facts included under this designation has been obtained in many, if not in most, cases by direct study and experiment upon lower forms of life, not only upon the mammals most closely related in structure to man, but also upon the simplest organisms which for one reason or another have offered especial opportunities for study.

It is convenient to consider the physiology of the human body under two general heads, viz., the properties of the tissues and the properties or functions of the organs and mechanisms. The human body, like that of other animals,

starts as a single cell, the fertilized ovum. During the progress of development this cell multiplies to form an infinite number of cells which gradually become distinguished in structure and segregated into groups that are known as tissues. Each tissue is characterized by its appearance, as seen by the eye or with the aid of a microscope, and also by known differences in chemical composition and reaction. We distinguish in the human body the muscular tissue, the nervous tissue, the epithelial tissue, the gland or secreting tissue, the blood, the connective or supporting tissue, the lymphatic tissue, the tissue forming the red blood corpuscles, and so on. Each tissue is different not only in structure but in its properties. Along with the differentiation in form there is a specialization in function. Without attempting to describe their microscopic characteristics, a word or two may be said of the more important physiological properties of some of these tissues.

Muscular Tissue. In man, as in the other vertebrates, we distinguish three kinds of muscular tissue: (1) the cross-striated or voluntary muscle which forms the musculature of the body by means of which our voluntary movements are made; (2) the heart muscle, composing the walls of the heart; and (3) the plain or unstriated muscle which is found in the walls of the hollow viscera, such as the alimentary canal, the blood vessels, the uterus, the bladder, etc. The common characteristic of these three tissues is the property of contracting. While this property may occur in other tissues, it reaches its greatest development in the muscles. In cross-striated muscles the contraction is always started by a stimulus received through the nerves and originated usually in the brain by an act of the will. The contraction is very rapid. A single stimulus gives a single or simple contraction that occupies less than one-tenth of a second. All of our ordinary voluntary contractions are, however, compound or tetanic, i.e., they are composed of a rapid series of simple contractions fused together more or less completely. The rapid series of contractions is due to a series of stimuli or nerve impulses received from the brain through the nerve fibres connecting it with the muscle. In every voluntary movement, therefore, whether short or prolonged, we must imagine to ourselves a series of changes in the nerve cells of the brain, which are propagated along the connecting nerve fibres to the muscle or muscles and there set up a series of contractions so rapid that they become fused into a long-lasting contraction or movement.

Plain muscle is characterized by the slowness of its contractions. The tissue as found in different parts of the body varies somewhat in this respect, but in all cases its contractions are very much slower than in the cross-striated muscle. The plain muscle, moreover, is not under voluntary control; we are not conscious of the movements of the stomach, the blood vessels, etc. The contractions of these organs are brought about by stimuli conveyed to the muscle through the so-called sympathetic nervous system. The slow and prolonged contractions of plain muscle explain the gentle, long-continued movements of the viscera such as occur in the action of the stomach and intestines in propelling food along their length. Heart muscle is intermediate in structure between the plain and the cross-striated varieties. Its contractions are also intermediate in duration, but approach closer to the quick

movement of the striped muscle. The predominant characteristic of heart muscle, however, is its property of making spontaneous rhythmic contractions which are due, not to external stimuli received through the nervous system, but to processes arising within itself. To this property is due the rhythmic beat of the heart.

Nervous Tissue. The nervous tissue is found in the brain, the spinal cord, the nerve ganglia of the sympathetic system, and the peripheral nerves or nerve trunks distributed throughout the body. The nerve tissue consists of nerve cells and their processes. The body of the cell lies in the nerve centres, i.e., the brain, the spinal cord, and the ganglia—and the typical cell has two kinds of processes—one comparatively short and much branched, known as the dendrites or dendritic processes; the other but little branched and in some cases very long, as much as 2 or 3 feet. This latter branch is known as the axi-cylinder process, it may pass out of the nerve centres to be distributed to the other tissues forming the essential part of what we call nerve fibres. It is important, therefore, to bear in mind that nerve fibres are essentially long processes from nerve cells and form the mechanism by which the nerve centres are connected with and influence the activity of the peripheral tissues. Physiologically the important function of a nerve fibre is to conduct a change or process known as the nerve impulse. This impulse travels along the fibre at a rate of about 100 feet per second. The nerve fibres fall into two great groups—those that convey impulses from the peripheral tissues to the nerve centres, and those that convey impulses from the centres towards the periphery. The former group compose the afferent or sensory fibres, the latter name being used because in many cases the impulses finally reach the brain and give rise to conscious sensations of various kinds. In many cases, however, the impulses conveyed to the nerve centres by the afferent fibres cause no change in consciousness, but manifest themselves by what we call reflex effects, as, e.g., in the movements of the intestines, the blood vessels, or the heart. The group of fibres that carry their impulses outward from the centre to the peripheral tissues compose the efferent or motor fibres. If these fibres end in muscles, the effect of their impulses is the production of a muscular contraction; if they end in a gland, they cause a secretion, the nature of the resulting action depending on the kind of tissue with which the nerve fibre is connected. It should be stated that there is no known difference in structure between afferent and efferent nerve fibres. Each, like a telegraph wire, can conduct an impulse in either direction. But just as a telegraph wire with a sending apparatus at one end and a receiver at the other is arranged to conduct messages only in one direction, so the afferent and efferent nerve fibres, by the peculiarities of their end connections, are arranged so that normally they can convey effective impulses in only one direction. What we call a nerve or a nerve trunk consists of many hundreds or thousands of nerve fibres belonging usually to both the afferent and the efferent group. Though combined in one bundle, each fibre is physiologically independent and may act alone or in combination with others in the same trunk. In a muscle, on the contrary, the hundreds or thousands of muscular fibres of which it is composed act

usually as a unit, all contracting together when the muscle is in action.

Reflex Actions. A large part of the beautiful adaptation and coördination of the different parts of our bodies is effected by the reflex activities of the nervous system entirely outside our conscious knowledge. The way in which these reflexes are produced is illustrated best by the simple reflex movements that can be obtained from a headless frog. If in such an animal, with its spinal cord intact, one of the toes is gently pinched, the leg will at once be drawn in towards the body. If the skin is stimulated by bits of paper moistened with dilute acetic acid, the leg of the corresponding side will be raised and the piece of paper will be wiped off by a neat movement involving the coördinate activity of a number of muscles. What happens in these cases is that the stimulus applied to the skin irritates the sensory nerve fibres and sends in a stream of nerve impulses to the spinal cord. These impulses are conveyed to the dendrites of certain motor nerve cells and arouse in them fresh impulses which are conducted outward through the efferent nerve fibres to the muscles. The original stimulus, or, more accurately, the nerve impulses to which it gives origin, are thus, as it were, reflected in the nerve centres and sent to the peripheral tissues, whence the name of reflex action. Every such reflex involves the activity of at least two groups of nerve cells, one connected with the sensory fibres stimulated and one connected with the efferent fibres going to the muscles. Such reflexes may occur in all parts of the spinal cord and brain. A common reflex in ourselves, e.g., is the winking of the eye when its sensory surfaces are touched. As a rule, we limit the term "reflex action" to those cases in which the element of consciousness is not involved. As a matter of fact, however, all of our conscious processes and mental activities are effected by a similar action of one nerve cell or unit on another, the mechanism in action being essentially similar to, although more complex than, the simple reflexes of the spinal cord. In a mammal as well as in a frog it can be shown that if a part of the spinal cord is severed from its connections with the brain, under such conditions that death does not result at once, the part of the cord below the injury will suffice to effect complex movements upon appropriate stimulation of the skin. To the uninformed such movements usually suggest consciousness, but the evidence of physiology proves conclusively that they are entirely unconscious reflexes.

It should be added that the outgoing impulse in reflex stimulation of the cord or brain may proceed through nerve fibres connected with other tissues such as the heart muscle, the plain muscle of the viscera or the glands, and the reflex effect, instead of exhibiting itself as a movement of the limbs, may take the form of a secretion, of a change in the heart beat, or of a constriction or dilatation of the blood vessels. Owing to the complexity of the connections among the numerous nerve cells in the spinal cord and brain, it is evident that reflex effects may be widespread and very intricate. Certain definite paths or connections are inherited or become acquired during life from repeated use, so that the passage of a sensory nerve impulse that reaches the central nervous system is not haphazard, but for the most part along predetermined paths. The wonderful instincts of the

lower animals may be regarded as complicated reflexes, and the unconscious regulation of the different parts of our body, especially the activity of the internal organs or viscera, is controlled in this way by the nervous system.

Circulatory Mechanism. The anatomical mechanism for the circulation of the blood and lymph consists of the heart, the blood vessels, and the lymph vessels. With regard to the blood we have the central fact that the powerful musculature of the heart serves as a force pump driving the blood out from the ventricles through the circuit of the blood vessels and back to the heart. The system of arteries branching from the heart resembles a tree with its central trunk and its vast number of branches of different sizes. As one goes outward from the heart towards the periphery, the arteries distributed to each organ become smaller and smaller until they end in minute capillaries. The combined area of these branches increases, however, towards the periphery, so that the sum of the areas of all the capillaries arising from the aorta is several hundred times as great as that of the aorta itself, just as the combined diameters of all of the twigs of a tree would much exceed that of the trunk. The quantity of blood being practically the same at all times, it becomes distributed as it goes out from the heart over a wider and wider area, or, to use a convenient figure, flows through a wider and wider bed. As a result of this fact the velocity of the blood flow becomes smaller as we approach the capillaries. While in the aorta the blood may flow with a velocity of 300 millimeters per second, in the capillaries the velocity becomes reduced to $\frac{1}{2}$ millimeter. In the venous system the same general fact holds true. The capillaries unite into larger veins, and these into still larger ones, until finally all of the blood in the aortic system is collected into two large veins, the superior and the inferior vena cava, which open into the auricles. As a consequence the blood, as it flows back to the heart, passes through a path that becomes narrower and narrower, and its velocity increases proportionately. With regard to the velocity of the blood flow, therefore, we can state that it is greatest in the large arteries and veins and least in the capillaries.

In the arteries, moreover, the blood is under a much greater pressure than in the capillaries and veins. From a cut artery the blood spurts to some distance, while from a cut vein the blood flows out quickly, but with little force. The cause of this difference is easily understood. In flowing through the vessels the blood encounters considerable resistance. Naturally this resistance is greatest in the capillaries and in the small arteries and veins communicating with them. On account of the great resistance in the capillary region, known technically as the peripheral resistance, the blood is dammed up, retarded on the arterial side, stretching the elastic walls of the arteries and putting the blood under a considerable tension. In the capillaries the pressure of the blood is much less, and in the veins it becomes smaller and smaller as we approach the heart. Physiologically the most important part of the blood circuit is in the capillaries. While flowing through these thin-walled and very minute vessels, the blood fulfills its function of nourishing the tissues. At this point the blood, while still under some pressure, is flowing at its slowest rate, and the liquid

part of it, the blood plasma, transudes through the thin walls and comes into direct contact with the tissues, thus forming the tissue lymph. The oxygen carried by the red corpuscles of the blood is liberated in the capillaries and diffuses from the blood to the tissues, being transported to the latter while held in solution in the lymph. The lymph gives up its food materials and oxygen to the tissue cells and at the same time receives from them the waste products and carbon dioxide formed during their nutritive activity. The lymph is prevented from accumulating in the tissues by the fact that it is continually drained off by the system of lymphatic vessels. These vessels form a system parallel in course and structure to that of the veins. They begin in the tissues by small capillaries which unite to larger and larger vessels, forming eventually two main trunks that open into the veins of the neck. By this arrangement the excess of lymph is continually drained off and returned to the blood. The means by which the supply of lymph is regulated forms one of the most interesting and difficult subjects of study in modern physiology.

The heart and blood vessels are not a fixed and rigid system. On the contrary they are supplied with nerves through which the beat of the heart and the capacity and resistance of the blood vessels may be reflexly adapted to the different conditions of the body as a whole, or the individual needs of its separate parts. The heart receives two sets of nerve fibres: one, the inhibitory fibres, are capable of slowing the heart beat; the other, the accelerative fibres, quicken the rate. The small arteries, on the other hand, receive also two sets of nerve fibres: one, the vasoconstrictors, causes a diminution in size of the blood vessels, while the other, the vasodilators, brings about an increase in size. The numerous conditions under which these regulating nerve fibres act are too complex to be described here. The mechanism is so adjusted as to control automatically the supply of blood to different organs under varying conditions of rest and activity.

Respiratory Mechanism. In mammals like ourselves the chief organ of external respiration is the lung. When the inspiratory muscles are contracted, the chest is enlarged and air flows into the lungs. When the expiratory muscles are contracted, the chest is diminished in size and air is forced out of the lungs. In ordinary respiration the expiratory act is entirely passive; the chest, expanded by the action of the inspiratory muscles, sinks back into its normal position when these muscles cease to act. In forced breathing, however, the expiratory muscles come into action. By means of these respiratory movements the air in the lungs is continually renewed, the supply of oxygen is maintained, and the carbon dioxide is removed. The oxygen contained in the air sacs of the lungs diffuses through their thin walls, and, coming into contact with the blood, it unites chemically with the coloring matter of the red corpuscles, the hæmoglobin. In this combination it is carried to the heart and thence distributed over the body through the various arteries. When the blood reaches the capillaries, the compound of hæmoglobin and oxygen is broken or dissociated by the physical conditions there prevailing, while the liberated oxygen passes into solution in the blood plasma and lymph and is thus conveyed to the tissues. On the other

hand, the general nutritive change or metabolism of the tissues results in the formation among other things of carbon dioxide. This substance is a waste product, and if it accumulates in the tissues brings on a suppression or perversion of the normal nutritive processes. Under normal conditions, however, it is rapidly removed by the lymph and blood. As the oxygen passes from the blood to the tissues by diffusion through the thin-walled capillaries, so the carbon dioxide, as rapidly as it is formed, streams in the opposite direction from tissues to blood. Each gas follows the physical law of diffusion from a point of greater to one of less tension. Within the blood the carbon dioxide is held mainly in chemical combination—partly with the proteids of the blood plasma, partly with the proteids of the blood corpuscles. When the blood reaches the lungs, this loose chemical union breaks down, the carbon dioxide is liberated and diffuses into the air sacs of the lungs, whence it is given off in the expired air. The process of respiration, therefore, may be divided into two parts, external and internal respiration. Under the former term we include all the processes involved in the movement of air into and out of the lungs, and the exchange of oxygen and carbon dioxide between the blood and the air in the lungs. By internal respiration we mean the exchange of oxygen and carbon dioxide between the tissues and the blood as well as the processes of nutrition by means of which the oxygen is used and the carbon dioxide produced. What we call arterial blood differs from venous blood in that it contains more oxygen and less carbon dioxide, and to this difference in the gaseous contents is due also the well-known variation in color—arterial blood having a scarlet tint, while the venous blood is purplish or crimson. The machinery for the movements of respiration, i.e., the respiratory muscles, is under the control of the central nervous system. These muscles may be influenced within certain limits by direct voluntary effort; but a far more important factor is their unconscious or reflex regulation exerted through the respiratory nerve cells or nerve centres found in the medulla oblongata. By the activity of this centre the respiratory movements are kept continually in play and the extent of the respirations is adjusted to the needs of the body.

Digestion and Nutrition. The living matter of the animal body is characterized, as compared with plant protoplasm, by its limited powers of assimilation. While the latter can construct living matter from comparatively simple inorganic material, such as carbon dioxide, water, and nitrogen-containing salts, the former requires food in the more complex form of organic material. Since in the last analysis this organic food is derived from the plant kingdom, it may be said that the maintenance of animal life is possible only through the synthetic activity of plant protoplasm. All of our varied foods are found upon analysis to be composed of essentially the same materials united in different proportions. These constituent materials of our foods are known as foodstuffs and are usually classified as *proteids*, *fats*, *carbohydrates*, *water*, and *salts*. Of these substances, the water, inorganic salts, and proteids are absolutely essential. The two former are necessary to the composition and reactions of the living tissues, but they do not directly furnish any energy to the body. The requisite amount of water is

controlled by the sensation of thirst, and the proper proportions of the inorganic salts are provided in our foods without the necessity of any conscious selection on our part, except perhaps in the case of sodium chloride. Proteid foods have a different value. They are complex nitrogen-containing compounds, which in the body are destroyed and reduced to much simpler substances, viz., carbon dioxide, water, and urea. This destruction of proteid is essentially an oxidation, and as much heat is given off in the process as would be liberated outside the body by burning proteid to the same end products. Proteids are an absolutely necessary constituent of food, because they contain nitrogen in a form capable of being used in the construction of living matter. Fats and carbohydrates, since they contain no nitrogen, cannot be used alone in the synthesis of protoplasm. They are nevertheless valuable foods, since they are readily destroyed or burned in the body with the liberation of energy in the form of heat or muscular work. In a normal diet proteids, fats, and carbohydrates are usually combined in certain proportions, and experience as well as direct physiological experiments show that within limits the fats and the carbohydrates may be interchanged, and furthermore the greater the amount of these two substances used the less will be the amount of proteid required; or, as we say in physiology, fats and carbohydrates are "proteid spacers."

The nutritive history of these three energy-yielding foods may be summarized briefly as follows: The proteids in whatever form they may be taken are digested partly in the stomach by the action of the gastric juice and partly in the intestines by the action of the pancreatic juice. By the act of digestion the food proteids are converted into simpler and more soluble forms, known as peptones and proteoses, which are then absorbed into the blood and carried to the various tissues. Here they are utilized in part to form protoplasm, either to replace that broken down in metabolism or to supply material for growth. But much the larger part of the proteid is simply destroyed in the tissues with the transformation of some of its chemical energy into a corresponding amount of heat. The fats are prepared for digestion in the stomach, but undergo the important change that fits them for absorption after they are brought into contact with the pancreatic juice in the small intestine. After absorption they are found in the blood and lymph for a time, but soon pass into the tissues. Here they may be deposited as part of our normal store of body fat, but with the usual diet of adult life they are supposed to be completely oxidized. It is known from experiments that 1 gram of fat burned outside or inside the body yields as much heat as 2.2 grams of proteid. The carbohydrates include the starches and the sugars, which from a nutritive standpoint have the same value. The starches form the bulk of our diet, and they are digested partly in the mouth by the action of the saliva, but mainly in the small intestine by the action of the pancreatic secretion. Under the influence of these secretions the starches are converted into a form of sugar, which is then absorbed into the blood. As the blood from the intestines passes through the liver, this absorbed sugar is removed and again converted into a form of starch known as glycogen, which is deposited or stored in the liver cells. From time to time the glycogen is recon-

verted to sugar and given off to the blood. The regulating mechanism controlling this production and conversion of glycogen is so adjusted that under the normal conditions of life the blood always contains a nearly constant amount of sugar. Sugar, therefore, is the final form in which all of our carbohydrate food is brought to the tissues, and under the influence of the living matter it is eventually oxidized to carbon dioxide and water. In the long run, therefore, the final fate of our food is to be burned and furnish energy in the form of heat, muscular work, etc. The continual consumption of food is necessary to maintain the body temperature, and in the body we have very complex regulating mechanisms which control the loss of heat and to a certain extent its production, with the normal result that the temperature of the body remains nearly constant under all the varying conditions of life. It has been shown with scientific accuracy that all the detectible energy given off from the body is derived directly from the food consumed. The energy value of any food can therefore be determined by ascertaining the amount of heat produced by burning it, or more conveniently by ascertaining the heat value of proteids, fats, and carbohydrates, and then analyzing the food to determine how much of these three foodstuffs is contained in it.

Central Nervous System. Some statements regarding the structure of the nervous system will be found in the beginning of this article. (See also NERVOUS SYSTEM AND BRAIN.) At the base of the brain immediately adjoining the spinal cord we have the medulla oblongata. In this part of the brain are found certain important collections of nerve cells which control the movements of respiration, of the heart, and of the blood vessels, their activity being entirely unconscious and under the influence of reflex stimulation. Collections of nerve cells connected with and regulating the action of physiological mechanisms are known as nerve centres, and in the medulla we recognize the existence of the three centres mentioned and designate them as the respiratory centre, the cardio-inhibitory centre, and the vasomotor centre. They and other similar centres regulate the activity of the visceral organs, whose functions are discharged for the most part without our conscious knowledge or control. Injury to the medulla or severance of its connections with the spinal cord is fatal at once, owing to the destruction of the connections of the respiratory centre with the respiratory muscles and the consequent inability to breathe. In the cerebellum we have an organ which seems to control the coördinated activity of the voluntary muscles. Extensive injury to the cerebellum, while not accompanied by actual paralysis, renders the animal incapable of executing orderly movements. If the animal survives the injury, the ability to make coördinated movements may be recovered more or less completely, but some awkwardness and muscular weakness persist as permanent results. In the nerve cells of the cerebral hemispheres we have the seat of the conscious sensations and of all the so-called psychic activities. Modern physiology has shown that different parts of the cerebral hemispheres have different functions. The optic nerve fibres end eventually in the occipital lobes, and here our conscious sensations of vision are mediated. A similar arrangement prevails for the other senses. In the cortex

of gray matter covering the cerebral hemispheres there are in fact certain sense areas each of which mediates a different kind of consciousness. Other areas are connected with the various muscles of the body and form the centres through which our voluntary movements are executed, while in still other regions we have areas in which are stored the memories of past experiences and in which the factors of sensation are organized into the complex associations that characterize our mental life. Injuries to the brain may therefore be followed by quite different results according to the region involved. There may be a paralysis of this or that group of muscles, a loss of this or that primary sensation, or a disturbance or perversion of this or that group of memory associations. The so-called aphasias form noteworthy illustrations of these facts. Injury to certain limited areas of the brain may result in a partial or complete loss of the power of speech, or of the ability to understand either written or spoken language without any interference with vision or hearing. When defects of this character exist, it is possible to locate the probable seat of the lesion, and not infrequently this knowledge has been made the basis of successful surgical operations.

History of Physiology. The history of physiology is coextensive with that of medicine. Its relatively slow advancement through many centuries was closely associated with the growth of anatomical, chemical, and physical knowledge. In modern times, however, dating perhaps from the first part of the nineteenth century, physiology has become an independent science with a technique peculiarly its own, yet adopting more and more the exact methods that have arisen in the sciences of physics and chemistry. This development of physiology has been especially marked since investigators abandoned the idea of a special vital force controlling the phenomena of life and set themselves to the task of explaining the properties of living matter in terms of the forms of energy recognized as responsible for the phenomena of inanimate nature. The great facts in physiology, as in other subjects, have been discovered in a few cases only by the genius of individual workers. In most instances they have developed gradually as the result of the combined labors of many investigators, so that a history of the growth of the fundamental principles of modern physiology involves a discussion of the progress of the natural sciences in general. Every important advance in physics and chemistry has influenced and will continue to influence the development of physiological knowledge. Some of the significant discoveries that belong especially to physiology and that can be traced more or less exactly to a definite period and individual observers are as follows: the circulation of the blood (Harvey, 1616-28); the existence of the lymphatic system of vessels (Aselli, 1622); the microscopic structure of the lungs, capillaries, glands, and other tissues (Malpighi, 1660-90); the discovery of the mammalian spermatozoon (Leeuwenhoek, 1674); the method of direct measurement of blood pressure (Hales, 1733); the digestive action of gastric juice (Réaumur, 1752); the independent irritability of muscle (Haller, 1757); the discovery of oxygen and its functions in respiration (Lavoisier, 1775); the distinction between motor and sensory nerve fibres (Bell and Magendie, 1811-22); the experiments on digestion (Tiedemann, 1826-46); the discovery of the mam-

malian ovum (Von Baer, 1828-34); the true nature of the secretions of glands (Johannes Müller, 1830); the existence of pepsin (Schwann, 1836); the nature of reflex actions (Marshall Hall, 1837); the electrical phenomena of muscle and nerve (Du Bois-Reymond, 1843); the existence of inhibition and inhibitory nerve fibres (Weber, 1845); the conservation of energy (Helmholtz, 1847); the introduction of the graphic method in physiological experimentation (Ludwig, 1847); the existence of secretory nerve fibres (Ludwig, 1851); the existence of vasomotor nerve fibres (Bernard, 1851); the existence and functions of glycogen (Bernard, 1857); the laws of nutrition (Bischoff and Voit, 1860) and of respiration (Pflüger, 1862); the function of hemoglobin in respiration (Hoppe-Seyler and Stokes, 1862-64); the localization of function in the cerebrum (Fritsch and Hitzig, 1870); the demonstration of the indefatigability of the nerve (Bowditch, 1890); the establishment of the fact of internal secretions (Brown-Séquard, 1891, and Sajous, 1903); the study of metabolism (Von Noorden, 1892-95); the action of the digestive glands (Pavloff, 1898). Twentieth-century physiology is closely linked with pathology, and their mutual progress is marked by the patient, world-wide coöperation of thousands of students rather than the isolated though brilliant discoveries of individuals. The subject covers a wide field and receives due notice in this work under such titles as BLOOD; BLOOD PRESSURE; IMMUNITY; NYSTAGMUS; OPSONINS; SECRETIONS, INTERNAL; ETC.

PHYSIOLOGY OF PLANTS. History. Up to the close of the seventeenth century nothing was known of the physiology of plants beyond the scattered impressions derived from the practical cultivation of plants in fields and gardens. Inasmuch as the physiology of animals was better known, the first study of the actions of plants was an endeavor to identify plant func-

tions with those of animals. As the functions of animals were only superficially known, this attempted identification led oftentimes to most egregious errors. But as the nature of animal functions became better known the essential identity of the processes in both sorts of living beings became more evident. At first the study of physiology was scarcely more than an enumeration of plant activities and their comparison with those of animals. Later, however, attempts were made to investigate the causes and conditions of the functions. For this a knowledge of anatomy was recognized as of prime importance. Deeper insight into physiology, however, demanded knowledge of physics and chemistry; and it was only when these two sciences underwent their profound transformation and extension that explanations of plant phenomena began to be possible. Among the earliest investigations after the revival of learning were those made in Italy by Malpighi on the movement of sap and those of Ray on the influence of light upon the colors of plants. About the same time, in Germany, Camerarius proved the necessity of pollen for the formation of fertile seeds.

Early in the eighteenth century Hales published his studies on the movement of sap and the evaporation of water from the leaves. Later in the eighteenth century came the investigations of Koelreuter, who added to the knowledge of sexuality in plants by his experiments on hybridization. It was in connection with these experiments that the relations of insects to pollination were first pointed out. Later (1793) these interesting relations were set forth at length by Christian Konrad Sprengel, whose famous "Das entdeckte Geheimnis der Natur" was scarcely appreciated until the contributions of Darwin had opened the eyes and understanding of naturalists to Sprengel's extraordinary work. About the same time Ingenhous showed that the green parts of plants when illuminated absorb carbon dioxide and eliminate oxygen, thus deriving the carbon which they need from the atmosphere. He also showed that the living parts of plants absorb oxygen, whether illuminated or not, and evolve carbon dioxide, thus establishing the fundamental facts of nutrition and respiration. This work was further confirmed by Senebier, who demonstrated that the decomposition of carbon dioxide takes place only in green organs. He also studied the influence of light upon the growth and green color of plants. By the beginning of the nineteenth century Nicolas Théodore de Saussure had shown that plants not only fix carbon from carbon dioxide, but also use the elements of water, which, with the mineral salts, are a necessary part of the food materials. Between 1822 and 1832 De Saussure and Goeppert established the connection between the respiration of plants and the development of heat in their bodies. Through the influence of Liebig, about the middle of the century, Ingenhous's clear exposition of the respiration of plants, which had been fairly established, was discarded, to be reinstated in confidence only after 1860 by the father of modern vegetable physiology, Julius von Sachs. Yet Liebig's valuable work in connection with the chemistry of foods and food materials of plants and Boussingault's investigations in France, especially in relating the known facts to the empirical processes of agriculture, were of great service to both cultivators

and physiologists. The year 1860 marks the rise of modern physiology, as indeed it does the rise of modern biology, many cooperating causes, the most notable of which was the publication of Darwin's *Origin of Species*, furnishing the impulse to renewed investigation.

Scope. As a science plant physiology concerns itself with every inquiry relating to the functions and behavior of living plants. Certain aspects of physiology, viz., the relation of living plants to the environment, physical (including soil, water supply, temperature, etc.) and biological (i.e., other plants and animals), have recently been separated from physiology proper and named ecology (q.v.). Physiology proper restricts itself to the activities of the individual plant. Its study demands a previous knowledge of the anatomy (q.v.) and histology (q.v.) of plants, since familiarity with plant mechanism must precede the knowledge of plant function.

The functions of plants may be divided for convenience into certain groups. *First*, processes connected with the absorption of materials by the plant from the surrounding medium. Everything which enters the plant body must do so in solution. The plant depends, therefore, fundamentally upon water, which, with an infinite variety of solutes, both solid and gaseous, it absorbs. (See ABSORPTION.) *Second*, processes by which materials escape from the plant body. Gases, especially carbon dioxide and oxygen, are evolved (see AERATION; OSMOSIS); a great variety of materials are eliminated from the plant body by various processes of secretion (q.v.); and water is evaporated in great quantity by the surfaces of land plants. (See TRANSPIRATION.) *Third*, processes by which water and foods are moved about from the points of absorption or manufacture to the points of use, storage, or loss. But in spite of the fact that the movement of water was almost the first subject that attracted the attention of observers, no satisfactory explanation has yet been devised. (See CONDUCTION.) *Fourth*, processes of nutrition. Carbohydrate foods are made only by green plants under the influence of light, a power which is of the utmost importance, since the commercial supply of food and energy depends at present almost wholly upon green plants. The making of carbohydrates is fully described in the article PHOTOSYNTHESIS. (See CHLOROPHYLL; CHLOROPLAST.) All plants, however, make protein foods, when the necessary supply of carbohydrates, nitrates, and salts is furnished. Protein synthesis is discussed in the article FOOD IN PLANTS. When protein foods are at hand, either through manufacture or absorption, they undergo various changes before they become a part of the protoplasm. (For what little is known of these processes, see ASSIMILATION.) *Fifth*, processes concerned with the release of energy in the plant body or adjacent to it, in such a way that the kinetic energy can be applied to such work as the plant must do. For most plants these processes constitute respiration. (See RESPIRATION IN PLANTS.) For a few plants fermentation (q.v.) seems to replace, in part at least, the normal respiration. *Sixth*, processes of repair and growth. One of the important activities of the plant is the formation of new material or the rearrangement of old into new parts. The diverse operations involved in this constitute growth (q.v.). *Seventh*, processes of

perception and response. Every function of the plant is more or less influenced by the changes occurring in its vicinity, whether these be entirely outside of the body or only in adjacent parts. In order to adjust itself to these changes the plant must receive impressions of them, and these impressions must result in appropriate adjustment. The changes in the protoplasm corresponding to changes in the surrounding medium and the chain of effects thus initiated are said to manifest irritability (q.v.). The visible alterations of the rate of growth (q.v.) or in movement (q.v.) are most striking evidences of irritability. See CHEMOTROPISM; GEOTROPISM IN PLANTS; HELIOTROPISM; HYDROTROPISM; MOTOR ORGAN; RHEOTROPISM; STIMULUS; TENDRIL; TRAUMATROPISM.

PHY'SODON (Neo-Lat., from Gk. φύσα, *physa*, bellows, breath, bubble + ὀδούς, *odous*, tooth). An extinct sperm whale known by its skull, found in the Miocene formations of Patagonia. It differed from the modern sperm whale in having enamel-capped teeth in its upper jaws. See CETACEA.

PHY'SOSTIG'MA. See CALABAR BEAN.

PHY'SOSTIG'MINE. See ALKALOIDS.

PHY'TOGEÓ'GRAPHY, or PLANT GEOGRAPHY. This subject concerns itself with the distribution of plants and has to consider both the causes which are at present operative in maintaining the distinctive floras of various lands and the historical changes by which these floras have been evolved. The various plant communities of allied forms due to climate and other physical factors, and the great plant families together with the areas they occupy, are discussed under DISTRIBUTION OF PLANTS (q.v.). There remains, however, that part of the subject which deals with the division of the earth's surface into phytogeographic regions, each with a distinctive flora of its own. Such regions are separated from one another by barrier lines that have retarded the migration of plants and resulted in the segregation of larger or smaller aggregations of species. For the complete understanding of such floras not only are the present conditions of the earth's surface to be considered, but also the development and distribution of plant life during past geological ages. (See PALEOBOTANY.) Barriers of the first rank are either climate or consist of interruptions of the continuity of the land surface by such large bodies of water as oceans; while

barriers of minor importance are to be found in smaller bodies of water, mountain ranges, and the minor elevation of various areas. The most pronounced of all barriers is along the tropic of Cancer, and in it the arid, hot climate of northern Mexico and of the Sahara and Asiatic deserts seems to be the effective factor. South of the tropic of Capricorn similar but less marked arid conditions, together with vast oceanic areas, form almost as effective a check to plant migration. Both encircle the globe in an east-west direction. The great north-south extent of the Atlantic and Pacific oceans provides the remaining natural areas of division for separating the globe into four areas occupied by great floral realms. They are (I) the Boreal, (II) the Paleotropical, (III) the Neotropical, and (IV) the Antarctic, to which may be added the vast extent of the waters in (V) the Oceanic.

I. **The Boreal Realm** is known also as the Arcto-Tertiary, since its flora seems to have descended from an ancient one which during Tertiary times encircled the pole well within the Arctic circle. Subsequent glaciation and postglacial migration have extended the limits of the descendants of this Arctic flora to the present boundaries of the Boreal realm, i.e., over almost all the vast land areas north of the tropic of Cancer. It has been variously divided into regions and provinces by Engler, Drude, and other phytogeographers, but the following main divisions are widely accepted, although at times they appear under other names and are given different rank: (1) the Arctic region, north of the limit of tree growth and lying almost wholly within the Arctic circle. It is sometimes divided into the Ne-arctic and Palearctic subregions, belonging respectively to the Western and Eastern hemispheres; but as many of the species are circumpolar such a division is rather artificial. In fact nothing is more characteristic of the entire region than the wide distribution of species and the absence of endemism (q.v.). Being without trees, the vegetation takes the form of tundras in which lichens, notably the reindeer lichen (*Cladonia rangiferina*), mosses (such as *Polytrichum* and *Sphagnum*), perennial herbs, and shrubs are dominant. Among the last shrubby willows, alders, birches, and evergreen members of the heath family, such as species of *Arctostaphylos*, *Vaccinium*, *Ledum*, and *Rhododendron*, are most abundant. (2) The Sub-arctic region, a circumpolar zone, begins at the northern limit of trees and extends to the southern limits of northern conifer forests. It contains many species common to the Arctic region mingled with others, making a much richer flora, in which species of *Abies*, *Picea*, and *Pinus* are the conspicuous trees. In North America the white and black spruces (*Picea canadensis* and *P. mariana*), the balsam fir (*Abies balsamea*), and the gray pine (*Pinus banksiana*), together with the white birch (*Betula papyrifera*) and aspen (*Populus tremuloides*), dominate the forests. The southern boundary passes from Maine along the St. Lawrence and Ottawa rivers to lakes Huron and Superior, where it bends northward, bordering the prairies of Manitoba and Alberta. In the western mountain region the southern limit is not well defined. (3) The Central European region, having its southern limit in France and westward at about the northern limit of the

vine, and the corresponding (4) Central Asiatic region, often subdivided into western, central, and eastern subregions, are vast areas naturally covered by grasslands and forests, oaks, beech, and pines being among the most abundant trees. Under cultivation they have become the home of cereal culture and allied forms of agriculture. The corresponding areas of America are occupied by (5) the Atlantic and (6) Pacific North American regions, with their deciduous forests in the east, their prairies and plains in the centre, and their conifer-clad mountains in the west. This too is one of the most important agricultural regions of the world. Finally, there are (7) the Mediterranean region, extending through southern Europe and including Africa to the Sahara desert, with cool wet winters, hot dry summers, and an abundance of broad-leaved evergreen trees like the olive and laurel, and (8) the somewhat allied Macronesian Island region containing the Azores, the Madeiras, and the Canaries. These islands are remarkable for a great development of the Ericaceæ (q.v.) and for the large number of endemic species.

II. **The Paleotropical Realm** includes the land areas of the Eastern Hemisphere contained within the tropics. It contrasts with the Boreal in having few widespread forms and in possessing a much vaster diversity of genera and species. Within it conditions for growth vary from the most arid deserts, practically without plants, to rainy tropics with the most luxuriant forests of the world. It has been variously subdivided. See PALEOTROPICAL REGION.

III. **The Neotropical Realm** is limited to tropical America and coincides with a similar division of zoögeographers. (See DISTRIBUTION OF ANIMALS.) Its subdivisions are: (1) the Central American region, including tropical Mexico, (2) the Antillean region with southern Florida and the West Indian Islands, (3) the Tropical South American region, and (4) the Austral South American region, including Chile, Argentina, Patagonia, and Juan Fernández Island. This last region is temperate rather than tropical in its climate, and includes rich temperate rain forests in southern Chile, plantless deserts in Bolivia, dry grasslands in Argentina, and treeless regions somewhat comparable to tundra in Patagonia, where it passes into the next realm.

IV. **The Antarctic Realm**, comprising the southern tip of South America and the regions within the Antarctic circle, contains: (1) the Austral American region, beginning with deciduous forests in Patagonia and extending through the shrubby areas of Tierra del Fuego to the treeless areas of the Falkland Islands and South Georgia. The forms and even some of the species are the same as in the Arctic region, although there are a greater paucity of species and many more endemic forms, owing doubtless to the lack of continuous land areas. Upon the Falkland Islands grass-grown tundras are characteristic, especially the remarkable tussock grass association composed principally of *Poa flabellata* fringing the beach. (2) The Austral Australasian region begins with the mountains and southern islands of New Zealand and includes Auckland and adjacent islands; (3) the Austral Indian Ocean region includes a few small islands with a scanty endemic flora, and (4) the Antarctic Continental region is plantless.

V. The Oceanic Realm includes all the oceans and its flora consists almost exclusively of algæ (q.v.), together with the minute floating plankton (q.v.). The vegetation is most abundant in colder seas, but there is greater diversity of species towards the tropics. There is much greater uniformity than on land, resulting in but three regions: (1) the Boreal region, with the greatest mass of vegetation, consisting mostly of the brown algæ (Phæophyceæ, q.v.), which include the great kelps that are among the giants of the plant world; (2) the Tropical region, with its smaller red algæ (Rhodophyceæ, q.v.) and vast areas covered with *Sargassum* (q.v.); and (3) the Austral region, similar to the Boreal but showing much less luxuriance.

Consult: V. M. Spalding, *Distribution and Movements of Desert Plants*, published by the Carnegie Institution (Washington, 1909); J. W. Harshberger, *Phytogeographic Survey of North America* (New York, 1911). Details of the flora of the various regions may be found under the various names of the regions and in articles under the names of the various countries. See DISTRIBUTION OF PLANTS and bibliography there given.

PHYTOLACCA (Neo-Lat., from Gk. *φυτόν*, *phyton*, plant + Neo-Lat. *lacca*, lac, from Pers. *lak*, *luk*, Hind. *lakh*, from Skt. *laksā*, lac insect, from *lākṣā*, hundred thousand, referring to the numbers of insects in each nest; so called from the crimson juice of the berries). A genus of about 20 species of dicotyledonous herbs and half shrubs of the family Phytolaccaceæ, natives of warm parts of Asia, Africa, and America. *Phytolacca decandra*, the poke or pocan, a native of North America, now naturalized in some parts of south Europe, is occasionally cultivated for its young shoots, which are eaten like asparagus. The juice of the berries, which are about the size and color of black currants, is employed in the adulteration of wine. The young shoots of *Phytolacca acinosa* are boiled and eaten in the Himalayas. Under the name *Phytolacca esculenta* it has been introduced into gardens.

In medicine *Phytolacca* is official under either of two forms, the fruit or the root of *Phytolacca decandra*, or poke, also called pigeon berry and garget root. The fruit is a small, deep purple, compound berry, nearly round, with a sweet and slightly astringent taste. The root is "large, branched, fracture fibrous, inodorous, sweetish, and acrid" (Potter). A fluid extract and a tincture are the preparations used, besides the berry and the root. The active principle is phytolaccin. Poke has been used in ulcers, eczema and other skin diseases, chronic rheumatism, mastitis, tonsillitis, and pharyngitis. It has been used to decrease adipose tissue and thus reduce obesity since 1858. When given in large doses phytolacca causes nausea, depression, vomiting, and purging. It lowers somewhat the rate of respiration and also weakens the heart's action, and has caused convulsions. See POKE, and Colored Plate of POISONOUS PLANTS.

PHYTOPH'THORA (Neo-Lat., from Gk. *φυτόν*, *phyton*, plant + *φθορά*, *phthorā*, destruction). A genus of the Phycmycetes (q.v.) best known by the species *P. infestans*, which infects potatoes and induces the disease known as potato rot, a disease of great economic importance. The mycelium vegetates in the green

parts of the plant, causing wilting and withering of the leaves and stems, the spore-bearing branches being sent to the surface in immense numbers. The mycelium winters in the tubers, and its presence leads to the discoloration and final decay often observed in the centre of the tubers. The economic importance of this disease may be inferred from the fact that it has been the chief cause of the famines in Ireland.

PHYTOSTERIN. See CHOLESTERIN.

PIACABA. See PIASSABA.

PIACENZA, pyä-chěnt'sā. The capital of the Province of Piacenza, Italy, situated on the right bank of the Po, 2 miles below its confluence with the Trebbia, 43 miles by rail south-east of Milan (Map: Italy, B 2). The city is gloomy in appearance, though its thoroughfares are broad and regular. The Stradone is one of the most beautiful streets in Italy. Piacenza occupies a position of great strategic importance and is fortified with solid walls and a strong castle. The Italian government has strengthened and extended these fortifications by the construction of external defensive works and by a formidable entrenched camp. The city has numerous fine palaces and churches. The cathedral, an edifice in the Lombard-Romanesque style, was built between 1122 and 1233. It has frescoes by Guercino and L. Carracci, and a large crypt with 100 columns. The entire building was restored about the beginning of the twentieth century. The Church of Sant' Antonino, the original cathedral of Piacenza, has been several times rebuilt. The early Renaissance Santa Maria di Campagna has excellent mural paintings by Pordenone. The noteworthy San Sisto, an ancient church rebuilt in the Renaissance, gave its name to Raphael's Sistine Madonna (sold by the monks in 1754 to Frederick Augustus II, Elector of Saxony). Among the other principal buildings are the immense Palazzo Farnese, begun in 1558 and never completed, once famous, but since 1800 serving as barracks; the fine Palazzo Municipale, dating from the thirteenth century, with its arched arcades and pinnacles; and the Palazzo dei Tribunali, with curious courts, now in ruins. The principal square is the Piazza dei Cavalli, so called from the colossal bronze equestrian statues of the dukes Alessandro and Ranuccio Farnese. There are a public library with over 142,000 volumes, a splendid theatre built in 1803, two new theatres, several secondary and technical schools, several hospitals, and an arsenal. Piacenza has manufactures of silk, cotton and woolen goods, hats, pottery, and machinery, and a trade in wine, grain, cheese, and marble from its quarries. Pop. (commune), 1881, 34,987; 1901, 35,952; 1911, 38,542; 1914, 39,658.

Piacenza, the ancient Placentia, was founded by the Romans in 219 B.C. In 200 B.C. it was plundered and burned by the Gauls, but recovered its prosperity with the construction of the Æmilian military road. In the twelfth century it became a member of the Lombard League. In 1545 Piacenza, along with Parma, was erected into a duchy for the Farnese family. (See PARMA.) An important battle occurred here in 1746 in which the allied French and Spaniards were defeated by the Austrians. Consult Giarelli, *Storia di Piacenza* (Piacenza, 1889), and Leo Jordan, "Die Renaissance in Piacenza," in *Archiv für Kultur-Geschichte*, vol. v (Berlin, 1907).

extreme lightness characteristic of the Viennese action. Stein's son-in-law, Streicher, in 1794 further improved this action and established a great reputation for his instruments. France was supplied chiefly with English pianos until Erard (a German whose name originally was

STREICHER'S GRAND PIANOFORTE ACTION.

Erhardt) settled in Paris in 1777. The Revolution drove him to London, where he made himself thoroughly familiar with English methods. Even after his return to Paris Erard continued to use the English action, but meanwhile he was seeking some improvement. His experiments resulted in 1821 in the double escapement action, which soon spread the fame of Erard all over the world. The next important manufacturer in France was again a native German, Pape, of Hanover. Pape invented, in 1827, a down-striking action where the action is above the strings. He also substituted felt for leather in the covering of the hammers (1830). But this departure had already been made a few years previous by Babcock, of Boston.

In order to save space some English makers towards the end of the eighteenth century conceived the idea of building pianos in an upright form. The first attempts consisted in nothing more than turning a grand or square instrument on one side. The first genuine upright was patented (1800) in England and the United States by John Isaac Hawkins, an Englishman living in the latter country. It is remarkable for containing most of the features which distinguish the modern upright. In the direct line of piano development, however, we owe a greater debt of gratitude to Southwell, who after 14 years of experimenting exhibited in 1807 the first upright piano that yielded practical results. This he called the Cabinet. In 1811 he built

FRENCH GRAND PIANOFORTE ACTION.

another instrument which shows many decided improvements. Wornum still further improved this model by the introduction of diagonal stringing. The increased length of the strings yielded a more powerful tone. He also invented a new action principle (the so-called lever-check action), which was taken up and further improved by Pleyel of Paris, in which form it became known as the French action.

It must not be imagined that the pianoforte immediately upon its appearance at the beginning of the eighteenth century superseded

the harpsichord or clavicembalo. These instruments continued to be made; the clavicembalo especially kept its position in the orchestra throughout the century. Composers still wrote for the harpsichord. The earliest known composition written especially for pianoforte appeared in 1771. The composer, a certain Mützel, entitles it "Duetto für zwey Claviere, zwey Forte-piano oder zwey Flügel." But the technique is not different from that of the harpsichord. The first compositions written especially for the pianoforte and showing a technique characteristic of the new instrument are three sonatas (op. 2) by Muzio Clementi, published in 1773. From that time on composers began to study the peculiarities of the pianoforte and to employ the proper technique. The colossal pianoforte works of Beethoven were destined to revolutionize the manufacture of pianofortes. Many of his pianoforte works were beyond the capabilities of the

ENGLISH UPRIGHT PIANOFORTE ACTION.

instrument at that time. Thus he gave a powerful stimulus to piano builders to increase both the compass and power of the pianoforte. In order to obtain power of tone the thickness of the strings had to be increased; to extend the scale the number of strings had to be increased. Manufacturers had to devise some frame capable of withstanding this enormous increase of tension. This led to the use of metal. In 1820 Allen and Thom patented a frame consisting of hollow metal tubes with brass and iron plates supported by heavy wooden crossbars. This was soon adopted by the leading manufacturers. Babcock, of Boston, in 1825 tried a cast-iron frame, and in 1832 Allen produced a frame that combined the string plate, tension bars, and wrest plank in one casting. This was still further improved by Chickering in 1837. In 1859 Steinway and Sons, of New York, added to the metal frame in one casting an agraffe, which is a small metallic support for the string, inserted between the bridge and the string for the purpose of preventing vibration in that part of the string. The same firm introduced also a double overstrung scale, which is obtained by dividing the strings into two sets, so that one set lies diagonally across the other.

Besides the improvements mentioned innumerable others have been and are still being made. From the four-octave instrument of Cristofori with a moderate tension, supported by a wooden sounding board, the modern pianoforte has de-

veloped into an instrument of tremendous tone power with a compass of over seven octaves and a tension amounting to several tons. A modern pianoforte consists of the following parts: (1) The frame, now almost universally made of iron cast in a single piece. At the rear end is attached the string plate, into which the strings are fastened. In the front there is the wrest plank, into which the tuning pins are set. Around these is wound the other end of the strings, and by turning these pins the tension of the strings is regulated. (2) The sounding board, a thin piece of wood placed under the strings for the purpose of reinforcing the tone by means of sympathetic vibration. (3) The strings, made of steel wire, increasing in length and thickness from the treble to the bass. The lower ones are made heavier by being overspun, i.e., wound around with a coil of thin copper wire. For the very lowest tones only one wire is used (A_2 - F_2). Then two strings for each tone (G_2 - C); above that three strings. (4) The action, the entire mechanism required for propelling the hammers against the strings. This includes the keyboard, a row of keys manipulated by the fingers. The keys corresponding to the natural tones are made of ivory, those corresponding to the chromatically altered tones, of ebony. When a key is pressed down the rear end rises and lifts a rod, called jack, which, in turn, throws the hammer against the string or strings. At the same time a damper is raised. The hammer, having struck the string, falls back immediately and is caught by a check, preventing a rebound. But as long as the key is pressed down the damper remains raised and thus allows the string to vibrate freely. (5) The pedals, levers pressed down by the feet. (a) The forte or loud pedal raises all the dampers, so that all the strings struck continue to vibrate even after the keys are released. (b) The soft pedal, which either throws all the hammers nearer to the strings, so that the striking distance is diminished by one-half, or shifts the hammers a little to one side, so that only a single string instead of the two or three is struck. (c) Some pianos have a third or sustaining pedal which does not raise all the dampers, but keeps raised only such as are raised by the keys at the moment this pedal is applied. It is the skillful use of these pedals that produces the wonderful variety of tone and tonal coloring which has become one of the chief factors in the art of modern piano playing. (d) Recently many upright pianos have been built in which the application of a pedal interposes a strip of felt between the hammers and strings, so that only a very faint sound is produced. This is a great convenience while practicing, and this device has made superfluous all digitariums or dumb keyboards, and even the one-time famous practice clavier, the use of which has always been justly opposed by musicians. (6) The case. According to the shape of the case, pianos are classified as grand, square, and upright. The square form is no longer built. For use in private homes they have been entirely superseded by the uprights, which latter take up far less room. The grand pianos are built in various sizes, from the full concert grand, 8 feet, 10 inches long, to the parlor or baby grand, 6 feet long. The cases are often very elaborately carved or even inlaid. Special instruments have been made that cost \$50,000.

For the sake of completeness it is necessary to speak briefly about some inventions made in connection with the pianoforte. There is a device for increasing the volume of tone. This is the æolian attachment, an arrangement by means of which a current of air is directed against the strings, reinforcing the vibrations and thus causing a considerable increase in the volume and duration of the tone. In 1891 Dr. Eisenmann, of Berlin, invented the electric piano. Besides the ordinary hammer action this instrument has an electromagnet attached to each string. By pressing down the keys an electric circuit is closed, and the action of the electromagnets causes a steady vibration of the strings. When the electric action is employed alone the tone of the piano closely resembles that of the stringed instruments. By means of a special pedal any tone or chord can be sustained at will even after the fingers have left the keys. The electric action or the hammer action may each be employed separately or both may be combined.

Piano Players. In the course of the nineteenth century numerous attempts were made to construct automatic pianos, and some of these were quite successful so far as the merely mechanical reproduction of the notes was concerned. But the soulless playing of these instruments, with its clocklike regularity and monotony, repelled people of musical instinct. The invention of the perforated paper roll, in 1887, revolutionized the construction of automatic instruments. The substitution of this roll for the older cylinders opened a vista of undreamt-of possibilities for the attainment of really artistic expression. By the end of the century a number of automatic pianos, such as the pianola, capable of yielding excellent results, were upon the market. As soon as the public discovered their merit a sudden and rapidly increasing demand sprang up, which stimulated the various makers towards attainment of perfection. Since 1900 so many patents have been taken out, so many claims for priority of invention have been advanced, that the historian is fairly bewildered and utterly unable to judge the merit of individual claims. Two kinds of players are now built. In one the mechanism is contained in a box which can be placed against the keyboard of any ordinary piano. In the other the mechanism is built into the piano in such a way that it can be disconnected at will whenever it is desired to play the piano by hand in the usual manner. Both players are constructed upon the same mechanical principles. A pair of bellows, originally operated by treadles, as in the parlor organ, but now generally by electricity, furnishes compressed air, thus causing the roll to revolve and unwind upon another roll. The perforations in the paper, passing over a row of small orifices, regulate the admission or exclusion of the air current which operates the fingers that strike the keys. All this is merely automatic; but a few ingenious devices enable the operator to secure absolutely individual interpretation. By means of a small lever the degree of loudness can be regulated. The pedal stop controls both the loud and the soft pedal. The metrostyle permits any variation of tempo. By means of the themodist it is possible to bring out with special emphasis certain melodic phrases, particularly those in the inner voices or bass. Most manufacturers have their rolls marked by eminent pianists for subtle modifications of tempo.

This is attained by an undulating red line on the right-hand side of the roll, and the operator need only see that the index needle of the metrostyle follows this line. The immense popularity of these piano players attests the widespread interest in music, and the instrument itself has become a most powerful factor in the education of the public taste. The exports of player pianos from the United States in 1914 were valued at \$335,299; other pianos, \$1,416,888; piano players, \$177,683; perforated music rolls, \$127,626.

In a class separate from the piano players just described is the autograph piano, which reproduces in its minutest details the performance of the individual artist. Perforated rolls, known as autograph rolls, are prepared by a secret process. The mechanical operation of the piano does not differ in any material respect from that of the usual machine. There is, of course, no need of any of the devices controlling interpretation on the part of the operator. The purpose of the invention is the preservation for posterity of the art of the individual artist.

PIANO PLAYER. See PIANOFORTE.

PIARISTS, pi'a-rists (from Lat. *pius*, pious), or FATHERS, or CLERKS REGULAR, OF THE PIOUS SCHOOLS. A religious congregation for the education of the poor, founded at Rome at the end of the sixteenth century by St. Joseph of Calasanza. He was a Spanish priest who, while in Rome, was struck with the imperfect and insufficient character of the education of even the higher classes and decided to devote himself wholly to the meeting of this want. In 1597 he opened a school, with the assistance of a few like-minded friends, which rapidly increased until, seven years after, it numbered 900 pupils and in 1613 as many as 1200. In 1617 the associates were recognized as a congregation by Paul V, and in 1621 as a religious order by Gregory XV. It spread during the seventeenth century into various European countries, and now has over 120 houses and about 40,000

pupils, principally in Italy, Spain, and America. The general, who is chosen for nine years, resides in Rome, where general chapters are held every six years. The system of education adopted in their schools is very thorough, and in many ways resembles that of the Jesuits, with whom the Piarists have always had some affinity; on the suppression of the Society of Jesus they received many of its members into their ranks. Consult Brendler, *Das Wirken der PP. Piaristen* (Vienna, 1896).

PIABOA, pe'a-rô'a. An Indian tribe of the upper Orinoco, near the mouth of the Mataveni, a tributary on the left bank. Their language appears to be unconnected with any other stock. Consult: Crévaux, in *Bibliothèque linguistique américaine*, vol. viii (Paris, 1882); Chaffanjon, *L'Orinoco et le Caura* (ib., 1889); Christian Brinton, *The American Race* (New York, 1891); A. Ernst, "Upper Orinoco Vocabularies," in *American Anthropologist*, vol. viii (Washington, 1895); A. F. Chamberlain, in *Journal de la Société des Américanistes de Paris*, N. S., vol. vii (Paris, 1910).

PIASSABA, or **PIACABA**, pe'a-sâ'bâ (Portug. *piassava*, *piacab*, from the native Brazilian name). A remarkable and important vegetable fibre produced by one or more species of South American palms. The greater part is furnished by the coquilla-nut palm (*Attalea funifera*), but Wallace states that much of it is produced from a species of *Leopoldinia*, which he has named *Leopoldinia piassaba*. This quality is known commercially as Pará piassaba. When the leaves decay the petioles split up into cylindrical, dark-brown, hard fibres varying from the thickness of a horsehair to the size of a quill. This material has been widely used in making coarse brushes, particularly those required for street-sweeping machines, for which purpose the coarsest have almost superseded all other kinds. The smaller fibres are used for finer brushes. In Brazil cables, baskets, hats, and many other articles are made from this fibre. Large quantities are exported. See **ARTALEA**; **CHIQUECHIQUE PALM**.

PIATIGORSK, pyä'té-görsk'. A town in Russia. See **PYATIGORSK**.

PIATRA, pyä'trá. A town of Moldavia, Rumania, situated on the Bistritza, about 55 miles southwest of Jassy (Map: Balkan Peninsula, F 1). It has a large number of churches and monasteries and is an important centre in the lumber trade. It is connected by rail with Bucharest. Pop., 1901, 17,391.

PIATT, pi'at, DONN (1819-91). An American lawyer and journalist. He was born in Ohio, was educated at St. Xavier College, Cincinnati, studied law, and was in 1851 elected judge of the Common Pleas Court. During President Pierce's administration he was Secretary of the Paris Legation, and for some months was acting chargé d'affaires. He enlisted in the Civil War and rose to the rank of colonel of volunteers, having served for the greater part of the war as adjutant general on General Schenck's staff. After the war he was a newspaper correspondent and founded the *Washington Capital*. His publications include *Memoirs of the Men Who Saved the Union* (1887) and the poem, *The Lone Grave of the Shenandoah* (1888). Consult C. G. Miller, *Work and Ways of Donn Piatt* (1893).

PIATT, JOHN JAMES (1835-1914). An American journalist and poet, born at James Mills,

Ind. After studies at Capital University and Kenyon College he was connected with Louisville and Cincinnati journals, and in 1871 was chosen librarian of the House of Representatives. From 1882 to 1893 he served as United States Consul at Cork and Dublin, Ireland. His poems are collected under many titles, among which are: *Poems of Two Friends* (1860), with W. D. Howells; *The Nests at Washington* (1864), with Mrs. Piatt; *Poems in Sunshine and Firelight* (1866); *Western Windows* (1869); *Landmarks, and Other Poems* (1871); *Idylls and Lyrics of the Ohio Valley* (1884, 1888, 1892); *At the Holy Well* (1887); *The Ghost's Entry, and Other Poems* (1895); *Odes in Ohio, and Other Poems* (1897). In prose he is represented by his *Penned Fly-Leaves* (1880) and *How the Bishop Built his College in the Woods* (1906)—His wife, SARAH MORGAN (BETAN) PIATT, became known for various volumes of verse. She issued her *Collected Poems* in 1894.

PIAUHY, p'ou-é'. A state of northeast Brazil, bounded on the east by the states of Ceará and Pernambuco, on the south by Bahia, on the west by Goyaz and Maranhão, and on the north by Maranhão and the Atlantic Ocean (Map. Brazil, J 5). Area, 92,670 square miles. The surface consists of vast plains broken by low ranges of hills. There are no forests and the climate is dry and hot, with frequent droughts. The chief rivers are the Parnahyba, forming the west boundary, and its tributaries. Agriculture is hindered by droughts and the scarcity of population, and the attempts to establish colonies of foreign immigrants have not been successful. The chief products are cotton, tobacco, and rubber. Stock raising is extensive and some cotton weaving is carried on. The mineral wealth, including iron, copper, sulphur, and silver, is not exploited. Pop., 1900, 334,328, 1913 (est.), 425,000, mostly of mixed race. The capital is Theresina (qv).

PIAZZA ARMERINA, pè-ât'sâ ür-mâ-ré'nâ. An episcopal town in the Province of Caltanissetta, Sicily, 18 miles southeast of Caltanissetta (Map: Italy, E 6). It stands on the crest and slopes of an isolated hill 1550 feet above the sea, on the left bank of the Terranova. It is the residence of many nobles and landowners. The town has a Renaissance cathedral (1517), an old castle now used as a prison, a Gymnasium, a seminary, a technical school, a library, and a picture gallery. The trade is chiefly in corn, wine, oil, fruits, and nuts; and there is also some furniture produced. Piazza Armerina was founded by the Greeks. It was destroyed in 1160, but was soon rebuilt. Pop. (commune), 1901, 24,379; 1911, 32,070.

PIAZZA DELLA SIGNORIA, dël'lâ sê'nyô-ré'a. See FLORENCE.

PIAZZA DEL POPOLO, pò'pò-lò. See ROME.

PIAZZA DI SPAGNA, spâ'nyâ. A square in Rome named from the Palazzo di Spagna, the residence of the Spanish ambassador. It is the centre of the foreign colony. Its most noted feature is the famous Spanish steps, leading to the church of the Trinità de' Monti, and the resort of picturesquely clad artists' models.

PIAZZA NAVONA, nâ-vô'nâ. The second largest public place of Rome, laid out on the site of the Stadium of Domitian, on the ruins of which the surrounding buildings rest. The piazza, officially called the Circo Agonale, corresponds in size and shape to the ancient stadium, and contains three fountains and an obelisk in

honor of Domitian, originally in the circus of Maxentius.

PIAZZA VENEZIA, vâ-nâ'tsé-a. See ROME.

PIAZZI, pè-ât'sé, GIUSEPPE (1746-1826). An Italian astronomer, born at Ponte, July 16, 1746. He is known principally for his work at Palermo, where he went in 1781 to take the chair of mathematics and where he established an observatory, which was put in working order in 1789. The first results of his observations were the corrections of some errors in the estimation of the obliquity of the ecliptic, the aberration of light, the length of the tropical year, and the parallax of various heavenly bodies. These results were published in 1792. On the night of Jan. 1, 1801, he discovered a new planet, the first known of the planetoids (q.v.). Piazzi was able to obtain only a very few observations of it before it passed too near the sun to be visible; from these observations Gauss (q.v.) was able to compute its orbit so that it was again found later in the year. Piazzi named it Ceres, after the ancient goddess of Sicily. In 1803 he published a catalogue of the fixed stars, the result of 10 years' observations and far superior to any before published. He was rewarded with a prize from the Institute of France. In 1814 appeared a new and more complete catalogue, containing 7646 stars, for which he was again rewarded with a prize from the French Institute. This catalogue is now regarded as his work of most lasting value to astronomy, and a new computation of his observations, by modern methods, is now being made. He also made researches into the nature of comets. In 1817 he was called to Naples as chief director of the government observatory, where he remained till his death, July 22, 1826. He wrote *Lezioni elementari di astronomia* (2 vols., 1817). Consult B. E. Maineri, *L'Astronomo Giuseppe Piazzi* (Milan, 1871).

PI-BESETH, pè-bâ'séth. See BURASTIS.

PIBROCH, pè-bròck (Gael *piobaireachd*, art of playing on the bagpipe, from *piobair*, piper, from *piob*, bagpipe + *feair*, OIr. *fer*, man, connected with Lat. *vir*, Lith. *wyras*, Lett. *wirs*, Skt. *vira*, Goth *waír*, AS, OHG. *wer*, man). The highest form of music written for the bagpipe. It consists of a series of variations written on a fundamental theme called *urlar*. These variations (generally three or four in number) increase in difficulty and speed, the last one, *creanluadh*, being a furious *presto*. What renders the notation of pibrochs particularly difficult is the great number of ornaments introduced, so that no definite rhythm can be discovered. A still greater difficulty is encountered because they make use of the eleventh overtone (a tone between f and f#) and thus cannot be reduced to any scale. Only in comparatively recent times (nineteenth century) has the expression of pibrochs in our notation been attempted. Before that all music for the bagpipe was taught by a special system, the different tones having such names as *hodroho*, *hananin*, *hiechin*, etc. An excellent collection of pibrochs was published in 1900 by Major General Thomson under the title *Ceol Mor*. See BAGPIPE.

PICA, pí'ká. See PRINTING.

PICA. See BULIMIA.

PICABIA, pè'ká'byá', FRANCIS (1878-). A French post-impressionist painter. He was born in Paris, where his artistic training was obtained. His work marks the transition from

cubism to orphism, a later phase of post-impressionism (q.v.) in France. Although Picabia possesses undoubted talent for form and color, he seeks, like a musician, to create an atmosphere, to arouse intellectual and spiritual sensations by means of rhythmic lines and harmonious improvisations of color, mainly cubical in form, rather than to give a transcription or recollection of reality. He was represented at the International Exhibition of Modern Art, New York, in 1913 by "The Dance at the Spring," "The Procession, Seville," "Paris," and "Souvenir of Grimaldi." In March, 1913, his impressions of New York were exhibited at the Photo-Secession Galleries, New York. He did much interesting work for the New York magazine called 291.

PICANDER. The pseudonym of the German poet Christian Friedrich Henrici (q.v.).

PIC'ARD. A corruption of Beghard. See BEGUINES.

PICARD, pé'kär', ALFRED (1844-1913). A French engineer and administrator, born at Strassburg. He attended the lycées of Nancy and Strassburg and the Ecole Polytechnique, graduating in 1864. Later he traveled extensively and returned to France to take part in the War of 1870-71. He was best known for the part he took in organizing the Exposition of 1900 as commissioner general. In 1904 he was a delegate to the St. Louis World's Fair. He was Councilor of State (1882-86), Minister of the Navy (1908), at various times was intrusted with engineering work by the government, and served as Inspector General of Bridges and Highways. He became a member of the Academy of Sciences and Grand Officer of the Legion of Honor. Picard's writings include: *Alimentation du canal de la Marne au Rhin et du canal de l'Est* (1881); *Les chemins de fer français* (6 vols., 1883-84); *Traité des chemins de fer* (4 vols., 1887); *Traité des eaux* (4 vols., 1890-94); *Rapport général sur l'exposition universelle et internationale de 1889* (10 vols., 1891-92), his greatest work; *Monographie de l'exposition universelle de 1889* (2 vols., 1895); *Rapport général administratif et technique sur l'exposition universelle de 1900* (1902-03); *Le bilan d'un siècle* (1906-07).

PICARD, (CHARLES) EMILE (1856-). A French mathematician, born in Paris and educated at the Ecole Normale Supérieure. He was lecturer on mathematics at Paris (1877) and at Toulouse (1879-81) and in 1886 became professor of the same subject at the Ecole Normale and at the Sorbonne. His principal works are: *Traité d'analyse* (3 vols., 1891-96; 2d ed., 1901-08); *Théorie des fonctions algébriques de deux variables indépendantes* (1897-1906), with G. Simart; *Sur le développement de l'analyse et ses rapports avec diverses sciences* (1905), lectures delivered in America.

PICARD, JEAN (1620-82). A French astronomer, born at La Flèche. In 1655 he succeeded Gassendi as professor of astronomy in the Collège de France. In 1666 he became a member of the Academy of Sciences. In 1671 he went to Uraniborg, on the island of Hven in the Sound, to determine the latitude and longitude of Tycho Brahe's observatory. The Paris Observatory and the *Connaissance des Temps* were founded by his efforts. He is known especially for his geodetic work in connection with determining by measurement the exact length of a degree of latitude.

PICARD, LOUIS BENOIT (1769-1828). A French dramatist, born in Paris. He began early to write plays, the first of which was *Le badinage dangereux* (1789). In many that he subsequently produced he was both author and actor, and he had several collaborators. His plays, excellent pictures of the time, are satirical and vivacious and have animated dialogue. The best include: *Encore des ménechmes* (1791), which made his reputation; *Médiocre et rampant* (1797); *Les marionnettes* (1807); *Les capitulations de conscience* (1809); *L'Intrigant maladroît* (1820). Several of them are printed in his *Théâtre* (8 vols., 1821) and *Théâtre républicain* (1832).

PICARD, LOUIS JOSEPH ERNEST (1821-77). A French politician, born in Paris. In 1858 he was elected to the Legislative Corps, where he was a member of the group known as Les Cing, and was reelected in 1869. In 1870 he became Minister of Finance in the government of the National Defense; with Jules Favre arranged for the capitulation of Paris in 1871; and then for a short time was Minister of the Interior in Thiers's cabinet. In 1871-73 he was Ambassador at Brussels; then resumed his seat in the Chamber of Deputies, to which he had been elected in 1871; and in 1875 became a life Senator. He was one of the leaders of the Left Centre. Picard founded a democratic weekly, *L'Electeur libre*, in 1868.

PIC'ARDY (Fr. *Picardie*). Formerly a province of France, now constituting the Department of Somme and parts of the departments of Pas-de-Calais, Aisne, and Oise. Its principal town was Amiens (Map: France, N., H 3). In 1167 Philip of Alsace, Count of Flanders, became Count of Picardy. It was acquired by Burgundy in 1435 and was united to France in 1477.

PICASSO, pé-käs'só, PABLO (1881-). A Spanish post-impressionist painter and sculptor, born in Malaga. He was the founder of cubism, which he developed after many changes of style. Although an able technician, Picasso came to recognize color only in effects of light; he seeks what he calls the psychical, not the physical, manifestation of form. The former is for him a matter of surfaces suggesting geometrical harmonies; he wishes his work to be judged by the abstract sensation it produces. In the post-impressionist exhibition at the Grafton Galleries, London (1912), and in the International Exhibition of Modern Art in New York (1913) Picasso was well represented by both paintings and sculptures. Consult J. G. Huneker, *The Pathos of Distance* (New York, 1913).

PIC'CADILLY. An important London street extending for about a mile between the Haymarket and Hyde Park Corner. One portion of the street contains many handsome shops, while the other is given up to fashionable residences. The name is referred to a kind of lace, fashionable in Queen Elizabeth's time, or to the collars so called during the reign of James I.

PICCINI, or PICCINNI, pé-ché'né, Niccolò (1728-1800). An Italian composer. He was born in Bari and studied with Durante and Leo at the Conservatory of Sant' Onofrio, Naples. After producing a number of operas at Naples he removed to Rome, where he brought out *Alessandro nell' Indie* (1758); *Cecchina zitella, ossia la buona figliuola* (1760), which had an unparalleled success; and *L'Olimpiade* (1761).

In 1776 he went to Paris, where Gluck was then the popular composer. Marmontel and others championed Piccini, and for several years a bitter controversy was carried on between the Piccinists and the Gluckists. Marmontel made a modern version of Quinault's drama *Roland*, and Piccini composed an opera on it, which had great success. He also composed *Iphigénie en Tauride*, a subject on which Gluck also had written an opera, *Atys*, and many others. He was professor in the Ecole de Chant (1783-91), was removed, and returned to Naples, where he suffered much annoyance from the espionage of the government on account of his supposed revolutionary sympathies. Returning to Paris in 1798, he succeeded in obtaining from Bonaparte the inspectorship of music at the National Conservatory, but he did not live to begin the duties of his office. He is of interest to the musical historian not so much for the quality of his work or his ability as an artist as for the important part he played in the overthrow of Logroscino (q.v.), whose buffo operas were then the vogue in Naples, and for his own defeat (together with the ideas for which he stood) by Gluck (q.v.). He was a most prolific composer, author of 131 operas and several oratorios. He died at Passy, near Paris.

PICCININO, pè'chè-nè'nò, NICOLÒ (1375-1444). An Italian soldier, born at Perugia. He entered the band of condottieri led by Braccio da Montone, and after the death of their chief was elected to succeed him. For a short time he served Florence, but in 1425 went over to Filippo Maria Visconti, of Milan. Fighting in his interest, he defeated Carmagnola and the Venetians at Soncino and at Cremona (1431), and at Imola in 1434 gained a victory over the Venetians and Florentines. He captured Bologna in 1438. The city revolted from Piccinino's rule in 1443 and, overcome by reverses and the loss of his son, he died the next year.

PICCIOLA, pèt'chò-là. A pathetic story by Saintine (1836) of a prisoner in the time of Napoleon I who beguiles the monotony of his confinement by caring for a plant which springs up between the stones of his cell and which he calls Picciola (poor little one).

PICCIRILLI, pèt'chè-rè'l'ì. A family of sculptors and marble cutters, the best known of them being ATTILIO (1866-). He was born in Massa, Italy, studied at the Academy of San Luca in Rome, and emigrated to New York in 1888. He was at first assistant to various sculptors less skilled in marble cutting than he, then exhibited independent works like "The Dancing Faun" (1904), "Thought" (1908), and "Mater Consolatrix" (1909). Among his best portrait busts are "My Brother Furio" and those of Mrs. Newcomb and Dr. Brann. His more ambitious undertakings include the MacDonough Monument, New Orleans (1898), the sculptures of the national Maine Monument, New York (1903-13), which received much hostile criticism, and the Firemen's Memorial (1913), Riverside Drive, New York. His work is characterized by high technical ability in the modeling as in the carving of the marble. He was elected associate of the National Academy in 1909. In 1915 he was awarded a gold medal at the Panama-Pacific Exposition.—His younger brother, FURIO (1869-), who also studied at the San Luca Academy in Rome and came to the United States, is known for delicately carved reliefs and statues, such as "The Young

Mother" (1908). At the Panama-Pacific Exposition he received a silver medal.

PICCOLO (It., small). A flute of small dimensions, having the same compass as the ordinary flute, while the notes all sound an octave higher than their notation. In joyous as well as violent passages this instrument is sometimes very effective in an orchestra. The piccolo is usually made in three keys, C, D \flat , and E \flat , the latter two being used almost exclusively in military music. Piccolo is also the name of an organ stop. See FLUTE.

PICCOLOMINI, pik'kò-lòm'i-nè. The name of an old Italian family whose ancestors settled at Rome, afterward removed to Siena, and finally obtained the Duchy of Amalfi. Its most eminent member was ÆNEAS SYLVIVS PICCOLOMINI, who became Pope in 1458. (See PIUS II.) The family also gave several cardinals to the Church, and another Pope, Pius III (q.v.).—**OTTA VIO PICCOLOMINI** (1599-1656), first Duke of Amalfi and fifth in direct descent from Pope Pius II, was a distinguished general in the Thirty Years' War on the Catholic side. He was born in Florence and first entered the Spanish military service, and then as captain in a Florentine cavalry regiment aided Emperor Ferdinand II against the Bohemians. He won distinction as a cavalry leader, served under Wallenstein, and at Lützen (1632) commanded the regiment of cuirassiers that met the last charge of Gustavus Adolphus. Wallenstein confided to him his secret designs against the Emperor; Piccolomini, however, communicated these designs to the Emperor, and after Wallenstein's assassination (1634) received as a reward for his fidelity a part of his estates. He took part in the battle of Nördlingen (1634), and in the following year was sent with a large force to aid the Spaniards in the Netherlands, where the French and Dutch were carrying all before them. Piccolomini speedily drove out the French, but his success against the Dutch was not so marked. In 1640 he was summoned to stay the Swedes, under Baner, who were threatening the hereditary possessions of Austria. He succeeded in checking the invaders in Bohemia and the Palatinate, but was badly beaten, along with the Archduke Leopold, in 1642 at Leipzig by Torstenson. He was now sent to the Netherlands to take command of the Spanish troops, and though the prestige of the Spanish infantry was destroyed by the Duke d'Enghien (the future Condé) at Rocroi (May 19, 1643), Piccolomini was again successful against both the French and the Dutch till 1648, when he was anew summoned to Germany to encounter the victorious Swedes. The Peace of Westphalia put an end to the Thirty Years' War soon after. Piccolomini had now attained the rank of field marshal. In 1650 he was raised to the dignity of a prince of the Empire. The King of Spain conferred upon him the Order of the Golden Fleece and bestowed upon him the Duchy of Amalfi, which had previously belonged to his family. With his son, Max, Piccolomini figures prominently in Schiller's *Wallenstein*. Consult C. M. Ady, *Pius II (Æneas Silvius Piccolomini), the Humanist Pope* (London, 1913).

PICCOLOMINI, DIE. The second play in Schiller's *Wallenstein* trilogy, produced in 1799.

PICENUM. One of the ancient divisions of middle Italy, extending along the Adriatic from the *Æsis* (now Esino) to below the *Vomans* (now *Vomano*) River, and bounded on the west

by Umbria, Sabinum, and Vestinum. It was anciently inhabited by the Umbrians, who were conquered by the Sabines, under whom the name Picenum was acquired. In 268 B.C. the district was reduced by the Romans to the condition of a dependency. Its territory was divided up among Latin-speaking settlers in 232 B.C. by the Lex Flaminia, and many of its inhabitants colonized in the town of Picentia. In Asculum, the old capital of Picenum, in 91 B.C., occurred the outbreak of the War of the Italian Confederacy against Rome. (See SOCIAL WAR.) Under Augustus Picenum formed the fifth political region of Italy.

PICHEGRU, pèsh'gru', CHARLES (1761-1804). A French revolutionary general. He was born Feb. 16, 1761, at Arbois in the Department of Jura, and was educated at the college of his native town. He subsequently attended the military academy at Brienne, where he taught mathematics and had Bonaparte as one of his pupils. He entered an artillery regiment in 1783 and was a lieutenant when the Revolution broke out. Pichegru became an ardent republican, joined the Army of the Rhine, and by his soldierly qualities soon attracted general attention and earned rapid promotion. In 1793 he became general of division and commander of the Army of the Rhine, and, in conjunction with Hoche, repeatedly defeated the Austrians and established himself securely in the Palatinate. After the arrest of Hoche his success at the head of the combined Rhine and Moselle armies was not less decided. The rapidity and boldness of his maneuvers when in command of the Army of the North, in 1794, again disconcerted the allies, and they were compelled to retreat beyond the Meuse. Pichegru completed the conquest of Holland in 1795 and ended a glorious campaign by organizing the Batavian Republic. He next visited Paris, and while there suppressed an insurrection in the suburbs of the city (April 1, 1795); but soon afterward went to take command of the Army of the Rhine, and for some time displayed his usual skill and energy, crossing the river in the face of the enemy and capturing the fortress of Mannheim. But the state of affairs at Paris, combined with the flattering promises and bribes held out to him by the Prince of Condé, converted Pichegru into a secret partisan of the Bourbons. His inactivity, though prearranged with the Austrian generals, was not suspected till he suffered himself to be defeated at Heidelberg and retreated, leaving Jourdan (q.v.) without support, thus compelling the latter also to retire. The suspicions of the Directory were confirmed by the seizure of Pichegru's correspondence, and he was immediately superseded by Moreau (q.v.). He then retired to his native town, where he lived till 1797, when he was elected one of the Council of Five Hundred. He soon became its president; but still continuing his intrigues with the Bourbons, he was arrested and subsequently transported to Cayenne, but escaped in June, 1798, to England. He entered heart and soul into the Bourbon conspiracy along with Cadoudal (q.v.), the two Polignacs, and others, the primary object of which was the assassination of the First Consul. The conspirators secretly reached Paris, and there in 1804 Pichegru attempted to persuade Moreau, who was on bad terms with Napoleon, to join them, but without success. But the plans of the conspirators were soon known to the police,

and an intimate friend of Pichegru, with whom he resided, sold the secret of his retreat to the police. Pichegru was suddenly arrested and taken to the Temple prison, Feb. 28, 1804. On April 6 he was found dead in his bed. The Royalists endeavored to fasten a charge of secret assassination on Napoleon, but it was generally, and probably correctly, believed that Pichegru strangled himself. Consult: Comte de Montgaillard, *Mémoire concernant la trahison de Pichegru* (Paris, 1804); De Vouziers, *Pichegru, général en chef de l'armée française: sa vie* (ib., 1870); E. Daudet, *La conjuration de Pichegru*, etc. (ib., 1901); Guillaumin, *Les derniers républicains: Pichegru, Simon, Delmas, Monnier* (ib., 1905); G. Caudrillier, *La trahison de Pichegru et les intrigues royalistes dans l'Est avant fructidor* (ib., 1908), containing a bibliography.

PICHICIAGO, pích'i-sé-á'gô. See ARMADILLO, and Plate of ANTEATERS.

PICHINCHA, pé-chén'chá. A volcano of the western range of the Andes in Ecuador, situated a few miles northwest of Quito (Map: Ecuador, B 4). It is an irregular mass of peaks, the highest of which, Huahua-Pichincha, has an altitude of 15,918 feet. Its crater is over 2000 feet deep; it is dormant, there having been no great eruption since 1660. On its slopes, on May 24, 1822, was fought the battle which secured the independence of the Republic.

PICHLER, pik'lér, ADOLF VON (1819-1900) (Ritter von Rautenkar). An Austrian poet and naturalist. He was born at Erl in Tirol, studied at Innsbruck and Vienna, published his first volume of poems in 1846, and in 1848 as an Austrian volunteer in the Italian campaign fought with great bravery. In 1867 he was appointed professor of mineralogy and geology in the University of Innsbruck. He wrote on the geology of the Alps and of Tirol, but is better known as the Tyrolese poet, author of *Fruhlieder aus Tirol* (1846), *In Lieb' und Hass* (1869; 3d ed., 1900), *Vorwinter* (1885), and *Spätfürchte* (1896), as well as tales, as, e.g., *Der Einsiedler* (1896), and dramas, among which may be mentioned *Die Tarquinier* (1860; 2d ed., 1898) and *Rodrigo* (1862). He also wrote *Ueber das Drama des Mittelalters in Tirol* (1850), *Zur Geognosie der Alpen* (1867), and other scientific works. Valuable autobiographic material is contained in his *Aus den März- und Oktobertagen zu Wien, 1848* (1850), and *Aus dem wälsch-tirolischen Kriege* (1849). His collected works appeared in six volumes (Leipzig, 1897-98); also in 17 volumes (Munich and Leipzig, 1904-08; 4th ed., 1909). Consult Prem, *Adolf von Pichler, der Dichter und Mensch* (Innsbruck, 1901), and R. M. Werner, in *Vollendete und Ringende* (Minden, 1900).

PICHLER, KABOLINE (1769-1843). An Austrian novelist, born (von Greiner) in Vienna. Her first novels, *Gleichnisse* (1800), *Oliver* (1802), *Leonore* (1804), *Ruth* (1805), possessed slight merit; *Agathokles* (3 vols., 1808), her best work, was meant to disprove the heresies of Gibbon's *Decline and Fall of the Roman Empire*. Succeeding novels were chiefly historical in matter, patriotic in purpose, and diffuse in style; e.g., *Die Grafen von Hohenburg* (1811); *Die Belagerung Wiens* (1824); *Die Schweden in Prag* (1827); *Henriette von England* (1832). She also wrote society stories, *Frauenwürde* (1808), *Die Nebenbuhler* (1821), *Zeithilder* (1840), which, like her autobiographical *Denk-*

würdigkeiten (1844), are wearisome and now seldom read; and some dramas, e.g., *Germanicus*. Her works are in 60 volumes (Vienna, 1820-44).

PICHON, pē'shōn', STÉPHEN (JEAN MARIE) (1857-). A French diplomat and cabinet officer, born at Arnay-le-Duc. He was educated at the University of Paris, studied medicine, but soon turned to journalism and in 1880 joined the staff of Clemenceau's journal *La Justice*. He entered Paris politics, becoming a member of the municipal council in 1882 and serving several times as secretary of that body. In 1885 he was elected to the Chamber of Deputies and in 1889-90 was its secretary. After 1894 he was successively Minister to Hayti, to Brazil, and at Peking, where he was stationed during the Boxer troubles, and to Tunis. Pichon was elected Senator from Jura in 1905, in the next year he received the portfolio of Foreign Affairs in Clemenceau's cabinet, and he held the same post under Briand in 1910-11 and under Barthou in 1913.

PICU'RIC ACID. See LAURIC ACID.

PICIDÆ, pī'sī-dē (Neo-Lat. nom. pl., from Lat. *picus*, woodpecker). The family of woodpeckers. See WOODPECKER.

PICK, BERNHARD (1842-). An American Lutheran clergyman and religious writer, born at Kempen in Prussia. He studied in Berlin and at the Union Theological Seminary, New York. After holding Presbyterian pastorates from 1868 to 1881 he joined the Lutheran denomination and subsequently occupied pulpits in Albany, N. Y. (1895-1903), and, from 1905, in Newark, N. J. Besides contributions to the *Cyclopædia of Biblical, Theological, and Ecclesiastical Literature*, the *Cyclopædia of Religious Knowledge*, and many periodicals, his publications include: *Luther as a Hymnist* (1875); *Life of Jesus according to Extra-Canonical Sources* (1887); *The Talmud: What It Is and What It Says about Jesus and the Christians* (1890); *Historical Sketch of the Jews since their Return from Babylon* (1892); *The Extra-Canonical Life of Christ* (1903); *Hymns and Poetry of the Eastern Church* (1908); *Apocryphal Acts of Paul, Peter, John, Andrew, and Thomas* (1909); *Translations of the Bible* (1913).

PICK'ARD, SAMUEL THOMAS (1828-1915). An American journalist and biographer, born at Rowley, Mass. From 1852 to 1894 he was editor and proprietor of the Portland (Me.) *Transcript*. He became the literary executor of John Greenleaf Whittier, whose niece he married, and trustee of the Whittier Homestead and Birthplace. Pickard published, besides many monographs, literary articles, and reviews, *Haithorne's First Diary* (1897); *Whittier as a Politician* (1901); *Whittier Land* (1904); *Life and Letters of John Greenleaf Whittier* (1907).

PICKELHERING, pīk'el-hā'ring. A stock fool in the drama. The name was probably first assumed in the early part of the seventeenth century by Robert Reynolds, who traveled through Germany with a company of strolling comedians.

PICK'ENS, ANDREW (1739-1817). An American soldier, born at Paxton, Pa. He removed with his parents to the Waxhaw settlement, S. C., in 1752, and fought in the Cherokee War in 1761 as a volunteer. At the beginning of the Revolutionary War he became captain of a militia company, and by successive promotions soon

attained the rank of brigadier general of South Carolina troops, gaining great distinction as a partisan leader. In 1779 he defeated a superior force of Loyalists under General Boyd at Kettle Creek, participated on June 20 in the battle of Stono Ferry, and defeated the Cherokees at Tomassees. He commanded the militia at the battle of Cowpens, Jan. 17, 1781, twice rallying them after they had been driven back, and for his gallantry received a sword from Congress. At the battle of Eutaw Springs, Sept. 8, 1781, he was in command of the Carolina militia, and in 1782 forced the Cherokees to relinquish their claim to a large tract of land now included in the State of Georgia. After the war he was a member of the South Carolina Legislature from 1783 to 1794, sat in Congress in 1793-95, was a member of the State Constitutional Convention, became major general of militia in 1795, and was again in the Legislature in 1801 and 1812. He was commissioner on many occasions to treat with the Indians.—His son, ANDREW, a lawyer, was Governor of South Carolina in 1816-18 and died in Mississippi in 1838. Consult Edward McCrady, *South Carolina in the Revolution* (2 vols., New York, 1902).

PICKENS, FORT. See FORT PICKENS.

PICKENS, FRANCIS WILKINSON (1805-69). An American statesman and diplomat, born at Togadoo, St. Paul's Parish, S. C. He studied at South Carolina College, was admitted to the bar in 1829, and three years afterward was elected to the State Legislature, where he soon became prominent as an advocate of nullification and the doctrine of extreme State rights. From 1834 until 1844 he was a member of Congress, in 1850-51 a delegate to the Nashville Southern Convention, in 1854 presiding officer of the South Carolina State Convention, and in 1856 a delegate to the General Democratic Convention in Cincinnati. The next year he was appointed United States Minister to Russia, but returned to America in 1860, and soon afterward was elected Governor of South Carolina. He zealously supported the secession movement, and immediately after the passage of the ordinance by the Charleston Convention began to organize an independent government. To this end he demanded the surrender of all Federal property within the borders of the State, and when Major Anderson refused to give up Fort Sumter, began to erect the batteries which afterward, under the orders of the Confederate government, caused its reduction.

PICK'EREL (double dim. of *pike*). One of the smaller members of the pike family, Lucidae. The Eastern, pond, or grass pickerel, jack, or green pike (*Lucius reticulatus*) is common everywhere east and south of the Alleghany Mountains. In Tennessee and Arkansas it reaches a length of 24 inches and is golden green marked with numerous dark lines and streaks, which are mostly horizontal and by their junction with one another produce a reticulated appearance. The banded pickerel (*Lucius americanus*), of the coast streams from Massachusetts to Florida, is 12 inches long and dark green, with about 20 blackish curved bars on the sides. The little pickerel (*Lucius vermiculatus*) occurs throughout the Mississippi valley, is 12 inches long and very variable in color, with an irregular network of fine curving streaks on the sides. The common pike is also frequently called pickerel. The habits and mode of catching are the same as in the case of the pike (q.v.). See

Plate of NEEDLEFISH, PIKE, ETC.; and Colored Plate of AMERICAN GAME FISHES, accompanying article Trout.

PICKEREL FROG. A small light-brown frog (*Rana palustris*) with dark square or oblong brown blotches in two rows on its back, and the head marked by a dark line which runs from the nostril to the eye. This frog dwells in the eastern United States, especially in mountainous parts, and occurs mainly about springs.

PICKERING, CHARLES (1805-78). An American naturalist, grandson of Col. Timothy Pickering, born at Starucca Creek, Pa. He graduated at Harvard in 1823 and at the Medical School three years later. After practicing for some years he was, in 1838, appointed naturalist of the United States Exploring Expedition under the command of Lieut. Charles Wilkes (q.v.). In 1843 he visited Egypt, Arabia, East Africa, and India. He published: *The Races of Man and Their Geographical Distribution* (1848); *The Geographical Distribution of Animals and Plants* (1854-61); *The Chronological History of Plants: Man's Record of his own Existence Illustrated through their Names, Uses, and Companionship* (1879).

PICKERING, EDWARD CHARLES (1846-). An American astronomer, brother of W. H. Pickering, born in Boston. He graduated at the Lawrence Scientific School, Harvard, in 1865, and for the next two years was instructor of mathematics there. From 1867 until 1876 he was Thayer professor of physics at the Massachusetts Institute of Technology, but in the latter year he returned to Harvard as professor of astronomy and director of the observatory. At the Institute of Technology in 1869 he established the first physical laboratory for general instruction in the United States, and later, in connection with his work at Harvard, established an important observatory at Arequipa in Peru. He devoted particular attention to the study of light and the spectra of the stars and published the results of his observations in the *Annals of the Harvard Observatory*. In 1906 Pickering became president of the Astronomical and Astrophysical Society of America. Nearly all the important scientific bodies of Europe elected him to membership or honorary membership. For his work on astronomical physics he received the Henry Draper medal, and he was awarded the Rumford (1891) and Bruce (1908) gold medals, and two others by the Royal Astronomical Society, London. In 1911 he was admitted to the German Order "Pour le Mérite." Heidelberg and Victoria University, Manchester, as well as many American universities, gave him honorary degrees. He published *Elements of Physical Manipulation* (2 vols., 1873-76).

PICKERING, JOHN (1777-1846). An American linguist and lexicographer, son of Timothy Pickering, born in Salem, Mass. He graduated at Harvard in 1796, studied law with Edward Tilgham in Philadelphia, was Secretary of Legation in Lisbon until 1799, and then became private secretary to Rufus King, United States Minister to England. He practiced law in Salem, Mass., from 1801 to 1827, was city solicitor of Boston (1827-46), and during his service in the State Legislature took a prominent part in revising the Massachusetts General Statutes. He was president of the American Academy of Sciences, first president of the American Oriental Society, an able linguist, and, like his father,

particularly interested in the languages of the North American Indians. He wrote an *Essay on the Pronunciation of the Greek Language* (Cambridge, 1818); *A Uniform Orthography for the Indian Languages* (1820); *Remarks on the Indian Languages of North America* (1836); *Vocabulary of Words and Phrases, Supposed to Be Peculiar to the United States* (1816); *a Greek and English Lexicon* (1826; 3d ed., 1846); as well as many monographs on ancient and international law. Consult the biography by his daughter, Mary Orne Pickering (Boston, 1887).

PICKERING, TIMOTHY (1745-1829). An American statesman. He was born at Salem, Mass., July 17, 1745, graduated at Harvard in 1763, and was admitted to the bar in 1768. In 1773 he drafted for the town of Salem a paper entitled *State of the Rights of the Colonists* and in the following year the memorial of the citizens of Salem to General Gage in regard to the Boston Port Bill. In 1775 he published *An Easy Plan of Discipline for a Militia*, which was adopted in the following year by the General Court of Massachusetts for use by the militia. In 1776 he joined the Revolutionary army and led an Essex County regiment to Tarrytown, N. Y. In the following year he took part in the battles of Brandywine and Germantown and was appointed a member of the Congressional Board of War, serving until its abolition. In 1780 he was appointed quartermaster general of the army and retained the office until its abolition in 1785. Upon his retirement from the army he engaged in business in Philadelphia, but two years later removed to the Wyoming valley, and became involved in the disturbances of that region, where he was instrumental in maintaining order and quiet. He settled the territorial disputes between Pennsylvania and the inhabitants of the Wyoming valley and organized Luzerne County, which he represented in the Pennsylvania Constitutional Convention of 1789. In 1790 he was commissioned by President Washington to negotiate a treaty with the Six Nations, which he did successfully, and later performed a similar service with the Indians of the Northwest. In 1791 Colonel Pickering was appointed Postmaster-General of the United States, which office he held until 1795, when he was appointed Secretary of War. Pickering signalized his administration by establishing a military school at West Point and by supervising the construction of the frigates *Constitution*, *United States*, and *Constellation*. Upon the resignation of Edmund Randolph near the end of 1795, Colonel Pickering was appointed Secretary of State, which office he held during the remainder of Washington's term and through the greater part of Adams's administration. In 1800 he was abruptly removed on account of a serious disagreement with the President growing out of the difficulties with France over the X Y Z correspondence (q.v.). He had used all his influence to hamper the President and to advance the political interests of Alexander Hamilton. He then retired to his uncleared lands in what is now Susquehanna Co., Pa., but was in poor circumstances, and some of his Massachusetts friends prevailed upon him to return to his native State, where in 1802 he became Chief Justice of the Court of Common Pleas. In the following year he was elected to the United States Senate, where he served until 1811. As a member of the House of Representatives he served from 1813

until 1817, when he refused a renomination and again retired to private life. He was an ardent Federalist, a prominent member of the group known as the Essex Junto, and was strongly opposed to the Louisiana Purchase and the War of 1812. He wrote numerous political papers, including a *Review of the Correspondence between John Adams and William Cunningham*. A biography of Colonel Pickering in four volumes was published by Octavius Pickering and C. W. Upham (Boston, 1867-73). In the library of the Massachusetts Historical Society at Boston are 62 manuscript volumes of the Pickering papers, an index to which was published in the *Collections of the Society*, 6th series, vol. viii (Boston, 1896).

PICKERING, WILLIAM (1796-1854). An English publisher. After serving for 10 years in a Quaker publishing house in Cornhill, London, he opened a bookshop of his own in Lincoln's Inn Fields (1820). Adding publishing to the business, he subsequently moved to Chancery Lane (1824) and to Piccadilly (1842). For printing he employed, up to 1829, the Chiswick Press. Subsequently his printing was done by Charles Whittingham, a nephew of the Charles Whittingham of the Chiswick Press. About 1830 he adopted the trade-mark of Aldus, the famous Italian printer—an anchor entwined with a dolphin, to which was added the motto, *Aldi Discip. Ang.* Among his notable undertakings were the "Diamond Classics" (a series of delicate volumes in 48mo and 32mo, issued between 1821 and 1831) and reprints of different versions of the Book of Common Prayer between 1549 and 1662 (6 vols., 1844), the typography of which has probably never been surpassed. Among his sumptuous publications may be cited Walton's *Compleat Angler*, illustrated by Stothard and Inskipp (2 vols., 1836). He also projected the Aldine edition of English poets. After his death the business was carried on by his son, BASIL MONTAGUE PICKERING (1836-78), who, among several reprints, issued a facsimile of the first edition of *Paradise Lost*. In 1878 the firm came to an end.

PICKERING, WILLIAM HENRY (1858-). An American astronomer, brother of Edward C. Pickering. He was born in Boston and in 1879 graduated from Massachusetts Institute of Technology, where he was an assistant and instructor in physics in 1880-87. In the latter year he was appointed assistant professor of astronomy at the Harvard Observatory. Pickering led eclipse expeditions to Colorado (1878), Grenada, W. I. (1886), California (1889), Chile (1893), and Georgia (1900); discovered Phæbe, the ninth satellite of Saturn, in 1899, and later Themis, the tenth satellite; made lunar observations in California in 1904; and visited Hawaii (1905) and the Azores (1907). He received the Lalande prize in 1905 and the Janssen medal in 1909. His publications include: *Guide to Mount Washington Range* (1882); *The Moon* (1903); *Lunar and Hawaiian Physical Features Compared* (1906); and contributions to the *Annals* of Harvard Observatory.

PICK'ET (OF. *piquet*, *piquet*, Fr. *piquet*, peg, dim. of OF. *pique*, *pioque*, Fr. *pique*, pike, probably from Lat. *spica*, point, ear of grain, tuft of a plant, pin). In a military sense the word "picket" has several meanings. 1. A *picket* is the name of one of the classes of small detachments comprised under the more general term "outguards," which form one of the sub-

divisions of outposts (q.v.). Briefly a picket is a group of men consisting of two or more squads (eight men to the squad), but ordinarily not exceeding half a company, posted on the *line of observation* to cover a given sector. It furnishes patrols and one or more sentinels, double sentinels, sentry squads, or Cossack posts, for observation in its own sector. (Consult *Field Service Regulations, United States Army*, 1914.) 2. A *picket line* is a secured line to which animals are tethered in camp or garrison. There are two kinds, *ground* and *high*. A ground line is stretched on the ground, attached at its ends and at intervals of about 30 yards to stakes or some other form of holdfast. Such is the picket line used in the United States service for cavalry and pack trains in the field. A high line is stretched above the ground to trees, stakes, or to the wheels of wagons and artillery carriages. This type of picket line is used by the United States field artillery. (Consult *Engineer Field Manual, United States Army*, Washington, 1914.) 3. A *picket pin* is a short iron pin, driven into the ground, to which is attached a lariat by means of which the individual cavalryman tethers his horse in the field. The picket pin and lariat form a part of the individual horse equipment and are carried on the saddle. 4. In field fortification *pickets* are wooden stakes, about 3 feet long, about which are woven brush to form brush hurdles, used as a revetting material. 5. Formerly in the British army the word "picket" was applied to a *military punishment*, now strictly forbidden, in which the weight of the body was sustained on one foot resting on a picket with a blunted point. See ADVANCE GUARD; OUTPOST; PATROL.

PICK'ETING. In labor conflicts, the practice pursued by trade-unions of stationing outposts near the place of employment where a strike is in progress, for the purpose of dissuading workmen not affiliated with the union from taking service with the employer against whom the contest is being waged. In theory a matter of persuasion, picketing, in strikes where feeling runs high, is apt to assume the form of intimidation against nonunion workmen, and as such has come within the cognizance of the police, who, as a rule, have been able to prevent the effective execution of picketing duty by the exercise of the authority vested in them to prevent open disorder and loitering in the public highways. Legally the question is a mooted one, and the real point in most cases that appear before the courts is one of fact as to whether the union watchers have overstepped their right of exercising moral persuasion and have resorted to force. See STRIKE.

PICK'ETT, GEORGE EDWARD (1825-75). An American soldier, born in Richmond, Va. He graduated at West Point in 1846, served in the Mexican War, and was brevetted first lieutenant for gallantry at Contreras and Churubusco and captain for his conduct at Chapultepec. He became first lieutenant in 1849 and captain in 1855. In 1856, while serving in Washington Territory, he occupied San Juan Island and prevented the landing of British troops. The dispute over the northwest boundary was in progress, and Sir James Douglas (q.v.), the Governor of Vancouver Island, had sent warships to eject the Americans; an engagement was averted only by the arrival of the British admiral, who refused to resort to force. He

resigned from the Federal army June 25, 1861, and became major of artillery in the Confederate army. On July 23 he was made colonel in the provisional army and was assigned to command in the lower Rappahannock. On Feb. 28, 1862, he was appointed brigadier general in Longstreet's division of Joseph E. Johnston's army, then known as the Army of the Potomac, but later as the Army of Northern Virginia. At Seven Pines he held his ground stubbornly, though outnumbered. He was seriously wounded at Gaines's Mill and on his recovery was made major general, in October, 1862. At Fredericksburg he held the centre of the Confederate line. At Gettysburg his division reached the field on the morning of the third day, July 3, and formed the centre of the attacking line in the famous assault on Cemetery Ridge. (See GETTYSBURG.) In September, 1863, General Pickett received command of the Department of North Carolina and made an unsuccessful demonstration against Newbern in January, 1864. When he returned to Virginia his division recaptured the Confederate lines at Drewry's Bluff in June. He was sent to Lynchburg to oppose Sheridan's cavalry in March, 1865, and was badly defeated at Dinwiddie Court House and Five Forks, but rallied his men and checked the pursuit. After the close of the war he went to Richmond, where he remained for the rest of his life. Consult L. C. Pickett, *Pickett and his Men* (Washington, 1905).

PICKLES (probably from Dutch and LG. *pekkel*, *pickel*, Mod. Ger. *pokel*, pickle, brine). Though the term "pickled" is applied to animal substances, such as beef, pork, and fish preserved in salt, yet pickles are generally understood to be the various kinds of fruits or vegetables preserved in vinegar. Pickle making varies both as a domestic and as a commercial process. A common process is first to wash the articles intended for pickles in clean cold water and afterward to soak them for a few days in a strong solution of salt in water. They are next taken out, dried in a clean cloth, or drained, and then placed in the vessels intended to hold them, a few peppercorns, or any other suitable spice, being sprinkled in from time to time. When the vessel is so far filled that it will hold no more, boiling vinegar is poured in until it is full, and it is then tightly covered. Pickles are also made by allowing the vegetable to ferment in salt. Dill pickles are made in this way with dill tops to be added as a flavor. Except in the case of green walnuts and one or two other pickles, extreme softness is objectionable. When the materials to be pickled are naturally green, as in the case of gherkins or small cucumbers, French beans, etc., it is considered very desirable to preserve their color as much as possible; and it is sometimes very successfully accomplished by steeping vine, cabbage, spinach, or parsley leaves in the vinegar, whereby their color is imparted to the pickles through the vinegar. It has been a common custom to green pickles by cooking them in copper vessels or by the addition of a small amount of a copper salt. The passage of national and State pure-food laws has very greatly lessened this custom in the United States. In domestic pickle making the same end is accomplished by covering the pickles with green grape leaves or some other leaves. Many fruits are preserved by pickling, in which case no salt is used and sugar and common spices are added to

the vinegar. Such are termed sweet pickles. Pears, plums, peaches, currants, cucumbers, and blackberries are particularly palatable when prepared in this way. The principal vegetables commonly preserved by pickling are cauliflowers, cabbage, cucumbers, gherkins, onions, tomatoes (green), young muskmelons (used for so-called mangoes), mushrooms, and nasturtium seeds. *Piccalilli*, or Indian pickle, is a mixture of various vegetables, as cucumbers, onions, cauliflowers, and of spices, pickled together. *Chowchow* is a mixed pickle to which mustard is added. Chutney is a famous pickle of East India origin, containing many tropical fruits highly spiced and seasoned. Pickles contain much water, sometimes more than 90 per cent, and consequently have a low food value. They are used chiefly as condiments or as delicacies. See FOOD, PRESERVATION OF.

PICKLE WORM, or PICKLE MOTH. A moth of the family Pyralidæ (*Diaphana nitidalis*), which occurs abundantly throughout the southern and western United States and lives in the larval state in cucumbers, boring into them and destroying them when about half grown, or at about the stage when they are preferably used for pickles, whence the popular name. It also feeds upon other cucurbitaceous plants, such as the squash, cantaloupe, and melon. The early generation of this insect feeds upon the leaves of the same plants, and there is little doubt that by carefully spraying them with arsenicals before the fruit is grown the insect may be held in check.

PICK'NELL, WILLIAM LAMB (1854-97). An American landscape and marine painter. He was born at Hinesburg, Vt, and studied under George Inness at Rome, Gérôme at Paris, and Robert Wylie in Brittany. He returned to America in 1882, but passed his winters in England and southern France. He was a member of the Society of American Artists and of the Society of British Artists, an Associate of the National Academy of Design, and received medals at Boston (1881 and 1888). His work is realistic and unaffected, with a fine feeling for line, brilliant light effects, often attained by use of the palette knife, and rich color, though he also succeeded well with the shimmering mist in his gray marines. His chief works include: "Route de Concarneau" (1880) and "En Provence," both in the Corcoran Gallery, Washington, "Borders of the Marsh" (1880), Academy of Fine Arts, Philadelphia; "Coast of Ipswich" (1882) and "Morning on the Loire," both in the Boston Museum; "Bleak December" (1887) and "Borders of the Loing," both in the Metropolitan Museum, New York; "Wintry March," Walker Gallery, Liverpool; "Morning on the Mediterranean," Luxembourg, Paris; "Toiler of the Sea," Carnegie Institute, Pittsburgh.

PICK'WICK CLUB, THE POSTHUMOUS PAPERS OF THE. A novel by Charles Dickens (1837). It was undertaken to accompany a set of comic sketches by Seymour, appearing as a serial in 1836 and 1837, and established Dickens's literary success. It is a work of humor throughout, giving rather loosely connected accounts of comical characters in many walks of life, such as Sam Weller, Alfred Jingle, Mrs. Bardell, Mr. and Mrs. Leo Hunter, linked together by the adventures of the amiable Mr Pickwick, chairman of the Club of Solemn Stupidity.

PICO, pē'kō. One of the Azores Islands (q.v.), belonging to the central group (Map: Portugal, A 4). It is 36 miles long and 4 to 10 miles wide, with an area of 173 square miles. It is traversed by a volcanic ridge, which rises 7613 feet high in the peak (Pico), whence the name of the island. The chief product is wine. Pop., 1900, 16,826; 1911, 15,138.
